## FOREWORD

The first full year of peace, as reported in this issue of *THE NEW INTERNATIONAL YEAR BOOK*, found the nations of the world trying to clean house, getting rid of the dust and debris accumulated through the previous six years, cleaning and renovating the furnishings, and trying to restore a regulated existence. By the end of 1946, however, the task was far from completed. Few of the many rooms of the house were wholly in order, if any were, and some of them seemed to show no net improvement, blowing up into fresh disorder at every sweep of the broom. The new cleaning agency, the United Nations, though it contrived to keep disorders from spreading during the year, was found to have so many faults in its mechanism that there was some fear lest it might break down completely.

In the United States, though everything seemed favorable for a speedy restoration to a peacetime economy, latent troubles, very like moths developing on the underside of a carpet, appeared in such numbers that many were far from subdued by the year's end. Strikes, and yet more strikes. Strikes of labor against management; strikes of capital against taxation; strikes of consumer against bureaucracy. Hence, despite an unprecedented demand for consumer goods, production was far from reaching the levels of previous peacetime years. Many of the restrictions imposed upon both producer and consumer as war measures were lifted during the year, but labor still chafed against management, and capital, fearing that the spiral of rising wages and prices of goods had not halted, was hesitant about investing new money into the financing of business expansion.

Other countries also found that the cessation of warfare did not automatically solve all difficulties. The Labor government of Great Britain found that deeply rooted habits, whether evil or not, would have to be broken before all of its socialistic reforms could be effected. Russia licked her wounds behind an "iron curtain" of secrecy. Spain, the black sheep among nations, faced ostracism but clung to her dictatorship. Other countries of Europe, notably Greece, Holland, and Germany, struggled against starvation. Civil war continued to beset China, despite all efforts by outside mediation to arbitrate differences. And elsewhere in Asia, hotbeds of insurrection flourished in India, Indo-China, and in the East Indies especially. In South America, Argentina remained, as previously, a "problem child," stubbornly resisting outside interference in the conduct of her affairs, and Bolivia underwent a violent revolution.

Regardless of economic and political disturbances, however, the everyday activities of the world continued to roll along. Grain, crops, and livestock were raised; coal was mined; airplanes, automobiles, trains, and ships carried passengers to and fro; entertainment by radio, theater, and motion picture was newly provided; books, magazines, and newspapers throughout the world were published. Sports, somewhat subdued during the war years, again proved of absorbing interest to increasing multitudes. Universities and colleges, particularly in the United States where young veterans of the war were offered tuition at government expense, flourished as never before.

The editors of this *YEAR BOOK* have brought together the outstanding authorities to review in these pages, not only what we have called the everyday activities of the world, but the political and economic activities as well. Many of these authorities have contributed to previous issues and need no introduction to our readers. Of those who are new, some have been introduced because of the unusual nature of their reports. Thus, Mr. James Rowe, Jr., former Assistant Attorney General, gives an eyewitness account of the Nuremberg Trials, at which he served as technical adviser; Lt. Comdr. W. Jerome Hagerty describes the tests of the atomic bomb at Bikini, and, jointly with Dr. Laurence A. Hawkins, Mr. Harry A.

Winne, vice-president of the General Electric Company, discusses the possibilities of controlled atomic energy as a source of power. Also of world importance was the peace conference at Paris, reported by Dr. John H. E. Fried.

Other new contributors to this issue of the YEAR BOOK are welcomed by the editors and will be noted by the readers of these pages. Among them we are proud to present Mr. George W. Mason, president of the Automobile Manufacturers Association, who has reviewed MOTOR VEHICLES during 1946; Dr. Lin Mousheng who reports on UNITED NATIONS; Mr. L. Welch Pogue, Chairman of the Civil Aeronautics Board, who discusses AERONAUTICS; Mr. H. Gerrish Smith, on SHIPBUILDING; Mr. Frank J. Taylor, president of the American Merchant Marine Institute, on SHIPPING; Vice Admiral Edward L. Cochrane, on SHIPPING AND SHIPBUILDING, U.S. NAVY; Mr. Terry Ramsaye, noted author and critic, who has reviewed MOTION PICTURES; Dr. Lawrence Reddick who presents an unusually straightforward report on NEGROES, and Mr. Bernard G. Richards who has written a similar report on JEWS AND JUDAISM; Dr. Vladimir F. Shishmarev who cabled his 1946 review of SOVIET LITERATURE from Moscow; Mrs. Judith Kaye Reed, on ART; Mr. Vernon Rice, of the *N.Y. Post*, on THEATER; Lt. General George E. Stratemeyer, on ARMY AIR FORCES; Miss Mary H. Swindler, on ARCHAEOLOGY; Mr. Conrad Taeuber, on SOCIOLOGY; Mr. Niles Trammell, president of the National Broadcasting Company, who presents RADIO BROADCASTING in 1946, Mr. J. R. Van Arsedale, on ADVERTISING, Miss Evelyn B. McCune, on KOREAN LITERATURE, and Dr. John Gillin, on ANTHROPOLOGY.

Among the outstanding regular contributions, attention should be called specifically to those of several authors upon whom heavy loads have been placed. These include the business and financial articles by Dr. Jules I. Bogen, the numerous articles upon the British Empire by Prof. Alzada Comstock, those upon the Balkan countries by Dr. Moses Hadas, the items upon the many sports by Mr. Thomas V. Haney, the articles upon the countries of northern Europe by Mr. Joachim Joesten, those upon minerals by Mr. Charles T. Post, those upon Russia and the countries of central and southern Europe by Prof. Frederick L. Schuman, and those of the countries of Africa by Prof. Robert Gale Woolbert. (It should be noted that Dr. Hadas, Prof. Schuman, and Mr. Joesten are not responsible for the paragraphs on statistics in the articles over their names.) The countries of South and Central America and those of the Far East were handled this year by a member of the staff, Mr. Joseph P. Blank, who also supplied many of the smaller, but essential, items of information that add to the value of this work.

CHARLES EARLE FUNK

## LIST OF CONTRIBUTORS

- Agatha B. Adams, M.A.**  
Associate Director, Extension Library, University of North Carolina  
SPANISH LITERATURE
- Nicholson B. Adams, Ph.D.**  
Professor of Spanish, University of North Carolina; Author, *The Heritage of Spain*  
SPANISH LITERATURE
- Arthur J. Altmeyer, A.B., M.A., Ph.D., LL.D.**  
Commissioner, Social Security Administration  
SOCIAL SECURITY ADMINISTRATION
- P. N. Annand, B.S., M.A., Ph.D., D.Sc.**  
Chief, Bureau of Entomology and Plant Quarantine, U.S. Department of Agriculture  
INSECT PESTS AND PLANT QUARANTINES
- Harry J. Anslinger, LL.B.**  
Commissioner, Bureau of Narcotics, Treasury Department  
NARCOTIC DRUGS CONTROL; NARCOTICS, BUREAU OF
- A. D. Batley**  
Statistician, National Safety Council  
ACCIDENTS
- Charles Robert Bell, B.A.**  
Lieutenant Commander, U.S. Navy  
NAVAL PROGRESS
- Harold R. Benjamin, A.B., M.A., Ph.D.**  
Dean, College of Education, University of Maryland; General Editor of *Education*, The McGraw Hill Book Co., Inc.  
EDUCATION
- James V. B. Bennett, A.B., LL.B.**  
Director, Bureau of Prisons, U.S. Department of Justice  
PRISONS, PAROLE AND CRIME CONTROL
- Arthur V. Berger, B.S., M.A.**  
Music Critic, *The Herald Tribune*, New York; Composer  
MUSIC
- Joseph P. Blank**  
Assistant Editor, *The New International Year Book*; formerly an Historical Editor, Army Air Forces  
ARTICLES ON FAR EASTERN, CENTRAL AMERICAN, SOUTH AMERICAN, AND CARIBBEAN COUNTRIES; U.S. TERRITORIES AND OUTLYING POSSESSIONS; STATISTICS ON EUROPEAN COUNTRIES
- Jules I. Bogen, B.S., A.M., Ph.D.**  
Editor, *The Journal of Commerce*; Professor of Finance, New York University  
BANKS AND BANKING; BUSINESS REVIEW; FINANCIAL REVIEW; FOREIGN EXCHANGE; PUBLIC FINANCE; TAXATION
- Amy Bonner**  
Associate Editor, *The New International Year Book*; *Eastern Representative*, Poetry, A Magazine of Verse; an Editor, Poetry Society of America Anthology; formerly Editor, *The Service Woman*; *The Military Nurse*; an Editor, columnist, contributor of editorials, New York Evening Post; literary critic; Secretary, Department of Philology, member of governing Council, Brooklyn Institute of Arts and Sciences
- O. A. Bontempo, A.B., Ph.C.**  
Contributing staff, *Modern Language Journal*; Director, The Language Workshop, College of the City of New York  
ITALIAN LITERATURE
- Omar Nelson Bradley**  
General, U.S. Army; Administrator, Veterans Administration  
VETERANS ADMINISTRATION
- Charles A. Breskin**  
Editor and Publisher, *Modern Plastics*  
PLASTICS
- Jack H. Bryan**  
Acting Director of Information, Office of the Housing Expediter  
NATIONAL HOUSING AGENCY
- A. S. Burack**  
Editor, *The Writer*  
MAGAZINES
- Vannevar Bush**  
Director, Office of Scientific Research and Development, Washington, D.C.  
SCIENTIFIC RESEARCH AND DEVELOPMENT, OFFICE OF
- Don L. Carroll**  
Chief, Office of Geologic Information and Reports, U.S. Geological Survey  
GEOLOGICAL SURVEY

# GLOSSARY

## OF IMPORTANT NEW WORDS AND WORDS IN THE NEWS

Compiled by HAROLD WARD

- americium.** A new radioactive element of atomic number 95, produced from uranium and plutonium by bombardment with helium ions in the course of research on atomic bombs. Its discovery was announced by Dr. Glenn T. Seaborg on November 16, 1945.
- anthellan.** A synthetic coal-tar drug claimed to be effective in the treatment of hay fever; developed by Dr. W. S. Loewe, a German-American pharmacologist.
- aralen.** An antimalarial drug first developed in Germany and tested in the United States; it is reported as superior to atabrine and quinine.
- artiscopes.** A device combining a stereoscope and drawing board, developed as a means of assisting handicapped veterans of World War II in learning how to draw from three-dimensional images serving as models.
- astatine.** The chemical element of atomic number 85, artificially produced in 1940 in the 60-inch cyclotron at the University of California by bombarding bismuth with alpha-particles. It is related to the group of halogens and was formerly known as alabamine. The symbol is At.
- astrobotanics.** The investigation of plant life on other planets, especially on Mars, as conducted by scientists in the U.S.S.R.
- atomite.** Rock material fused into hard, greenish, crystalline lumps by the heat of an atomic bomb; first noted following the explosion of the test atomic bomb dropped from a tower on the Alamogordo Air Base, New Mexico, July 16, 1945.
- axlon.** Generic name for synthetic textile fibers made from a protein base, as casein, etc.
- baby lung.** A resuscitating device for supplying oxygen in the emergency treatment of infantile paralysis and in other cases of impaired lung action and anoxia; useful as a temporary substitute for an iron lung.
- bat.** A winged aerial bomb guided to the target by radar control; used by the U.S. Navy against Japanese shipping during World War II.
- colistatin.** An antibiotic isolated in the U.S.S.R. from a bacillus (*Bacillus coli*) found in black earth and thought to be effective in arresting the growth of certain disease germs, as those of pneumonia and dysentery.
- contrails.** (1) The delicate vapor trails which sometimes stream out in the wake of an airplane flying at high altitudes, caused by condensation of moisture from exhaust gases of the engine. (2) The complicated evolutions of an airplane in a fight (dog-fight) with an enemy airplane.
- curium.** A new radioactive element of atomic number 96, produced, with americium, by the bombardment of uranium and plutonium with helium ions during research on atomic bombs. Its discovery was announced by Dr. Glenn T. Seaborg on November 16, 1945.
- decca.** A British system of radio aid to navigation similar to loran in requiring a network of shore stations for transmission of signals.
- dineutron.** A hypothetical atomic particle resembling the neutron but with double its mass, assumed to result from the action of double-weight hydrogen (deuterium) upon triple-weight hydrogen (tritium). Suggested by two American physicists, M. Y. Colby and R. N. Little, Jr.
- Donovan body.** A micro-organism believed to be responsible for causing certain forms of arthritis, as well as a rare type of venereal disease affecting the entire body.
- electropult.** An electrified runway for launching airplanes at high speed and within relatively short distances. It consists of a rotor laid down as a track and a stator installed in the car on which the airplane is carried until adequate lift power is generated.
- elevon.** A combined aileron and elevator, as used in the flying-wing airplane and certain types of jet-propelled airplanes.
- enterogastrone.** A hormone-like substance from the mucous lining of the intestine and having the power to counteract the acidic action of the gastric juices.
- erythrin.** A substance isolated from the red blood cells of rabbits by a Soviet scientist and under investigation as an antibiotic against certain disease germs, especially those causing diphtheria.
- eumycin.** A substance regarded as a promising antibiotic against diphtheria and tuberculosis bacteria and the fungus causing athlete's foot.
- fluorocarbon.** Any hydrocarbon compound in which the hydrogen has been replaced by fluorine.
- guyot.** Any of a type of submarine mountains usually having a flat central depression surrounded by a gently sloping marginal shelf which terminates in an abrupt fall to the ocean floor. Many are from 10,000 to 15,000 feet in height, but all are submerged beneath the ocean. Discovered in certain parts of the Pacific and described by the American physiographer H. H. Hess, who named them after A. H. Guyot, a Swiss geographer.
- hydro-bomb.** An aerial torpedo which, on striking water, descends to a given depth and is propelled by jets of gas expelled from the rear as in a rocket.
- icarscope.** An instrument resembling the telescope but designed for viewing the sun clearly and without dazzle by filtering the light through two rapidly revolving disk shutters interposed between a phosphor screen from whose surface it is transmitted to the eye as a continuous afterglow.
- ichthiamin.** A substance isolated from raw fish and clams which appears to inhibit the action of thiamin, converting it into a compound lacking vitamin value.
- inhibine.** A body chemical formed by the action of harmless green streptococci in human saliva and believed to be effective in preventing the growth of certain disease germs.
- Koha.** A photosensitive chemical developed by the Japanese from neocyanine, a dye substance; under the name *rainbow wave drug* it has been re-

- ported as effective in the healing of wounds and in stimulating the growth of new tissues in diseased areas of the body.
- KR method.** A method for the treatment of cancer by infecting the patient with certain bacterial toxins, as from trypanosomes, which are thought to be active in the destruction of cancerous growths. Developed by and named after Nina Klyeva and her husband, G. Roskin, cancer specialists of the U.S.S.R.
- Lewis.** An agglutinin believed to constitute a new blood type inherited as a Mendelian dominant; named after Mrs. H. D. G. Lewis, one of the women in whose blood it was first detected by British scientific workers.
- mesantoin.** A synthetic drug chemically related to dilantin, which it resembles in its ability to moderate the convulsions of grand mal epilepsy.
- metascope.** An optical instrument for seeing in the dark by means of a system of lenses, spherical mirrors and phosphor screens for the collecting of infra-red light. Developed for the use of American armed forces in World War II.
- methoxone.** A chemical weed-killer first developed in England and found very effective against weeds infecting grain fields.
- metopryl.** A powerful general anesthetic of the methyl ether type, reported as less irritating than ether and conducive to great muscular relaxation for long periods.
- microbalancer.** A sensitive electronic device for detecting imperfect balance in rotating elements of machinery.
- myosmine.** An alkaloid found in and isolated from tobacco smoke; now produced synthetically and used to improve the smoking qualities of tobacco.
- napalm.** A substance developed in the United States to increase the incendiary effect of flame throwers; now converted to use as a liquid soap.
- neptunium.** A highly unstable radioactive element of atomic number 93, artificially produced by neutron bombardment of the nucleus of the uranium atom; of importance in the development of atomic (nuclear) energy.
- numeroscope.** A high-speed calculating device in which beams of electrons trace numbers on the surfaces of a battery of cathode-ray tubes. Designed by Harrison W. Fuller, of the Harvard Computation Laboratory, to facilitate the use of the more complex electronic calculators by recording the numerical results of the different stages of a given operation.
- nutrient X.** A food factor of undetermined composition discovered in a large variety of foods, especially in liver extract, egg yolk, and lettuce, and thought to be essential in giving palatability.
- orbit.** To make circles around a given point or location; said especially of airplanes while flying above the same ground area during the expected approach of enemy aircraft or to receive instructions.
- paraseed.** A plant seed which is carried for long distances by air and wind, as the seeds of dandelions, milkweed, thistles, etc.
- pentamquine.** A synthetic drug used with quinine in the treatment of malaria.
- permafrost.** That part of the earth's surface in Alaska and elsewhere in arctic regions which is permanently frozen.
- plutonium.** An unstable radioactive element of atomic number 94, produced from uranium by nuclear absorption of neutrons; developed during research on atomic bombs and an important source of atomic (nuclear) energy.
- proteinogen.** A complex nitrogenous substance assumed to be the basis of all proteins elaborated in plant and animal organisms.
- sferics.** Those atmospheric conditions due to electromagnetic disturbances, as from lightning, thunderstorms, etc., especially as they affect weather and radio transmission.
- sodar.** A device for obtaining information on local weather conditions by projecting sound waves directly overhead and analyzing the echoes as recorded on an oscilloscope. The name is a contraction of *sound detecting and ranging*.
- stereofluoroscope.** A fluoroscope designed to give a three-dimensional image.
- synchrotron.** An atom-smashing machine combining features of the cyclotron and betatron but utilizing a new principle which permits synchronizing the acceleration of atomic particles to speeds yielding energies of 300-million volts or more.
- technetium.** The chemical element of atomic number 43, artificially produced in 1937 by the bombardment of molybdenum with neutrons or deuterons in the 37-inch cyclotron at the University of California. Formerly known as masurium. The symbol is Tc.
- teleran.** A system of air navigation which combines the principles of television and radar in gathering all relevant information by ground stations, whence it is transmitted to all aircraft within range, for instantaneous reproduction on television screens.
- thénardol.** A liquid antiseptic based on, but more stable and effective than, hydrogen peroxide; it is used for treating wounds and certain infections of the eye, ear, nose, throat, and skin. Named after Jacques Thénard, French chemist, who discovered hydrogen peroxide.
- thermistor.** A device for measuring blood temperature by direct contact with the blood stream. It consists of a minute heat element thrust into a hollow needle and connected with wires which transmit changes in electrical resistance that can be read off in terms of temperature within a range of from 97 to 133 degrees F.
- thymine.** A synthetic drug which has been used with promising results in the treatment of pernicious anemia. The original substance was first isolated from the thymus gland.
- Trinoscope.** Trade name for a system of color television by electronic means now under development by the Radio Corporation of America. The image is scanned by a color-slide television camera and received by a set of three Kinescopes which blend the separate color signals into the completed picture on the screen.
- triptane number.** An improved measure of the efficiency of a motor fuel, expressed in terms of a blend of normal heptane and the high-quality fuel triptane, each containing a specified amount of tetraethyl lead.
- tristeza.** A destructive disease of grafted citrus trees, attributed to a virus and characterized by rapid starvation of the plant tissue due to blocking of food transport between the graft and the original roots.
- visagraph.** An experimental reading device for the blind. It converts ordinary printed matter into raised characters which may be interpreted by touch as in the Braille system.

## MEMORABLE DATES OF 1946

- Jan. 1.** In an Imperial Rescript, Emperor Hirohito disclaims his own divinity.
- Jan. 3.** President Truman requests Congress to pass legislation to avert crippling strikes.  
William Joyce ("Lord Haw-Haw") is hanged in London as a traitor.
- Jan. 5.** Egypt's Finance Minister, Sir Amin Osman Pasha, is assassinated in Cairo.
- Jan. 10.** First General Assembly of United Nations meets in London; elects Paul Henry Spaak, of Belgium, President.
- Jan. 14.** Beginning of three-day general strike in Argentina.
- Jan. 15.** Strike of 200,000 C.I.O. electrical workers cuts off production of all appliances.
- Jan. 17.** United Nations Security Council meets for first time in London.
- Jan. 20.** General Charles de Gaulle resigns as head of French Provisional Government.  
Some 800,000 steel workers strike.
- Jan. 21.** In State of the Union message, President Truman urges passage of twenty-six measures.  
M. Gouin elected head of French Government.
- Jan. 24.** Atomic Energy Commission created by United Nations General Assembly.
- Jan. 26.** Strike of 250,000 meat-packing workers prompts Government to take over industry.
- Feb. 1.** Trygve Lie elected Secretary-General of United Nations.  
Dr. Tildy elected President of Hungary.
- Feb. 5.** U.S. and Great Britain recognize Government of Rumania.
- Feb. 6.** Security Council rejects Russia's request to investigate presence of British troops in Greece.
- Feb. 10.** Generalissimo Stalin outlines new five-year plan for Russia.
- Feb. 11.** Terms of Yalta secret agreement made public.
- Feb. 12.** State Department accuses Perón regime in Argentina of Axis complicity.
- Feb. 13.** Harold L. Ickes, Secretary of Interior, resigns.
- Feb. 15.** Steel strike ends with 18½-cent per hour wage increase.
- Feb. 18.** Four American Archbishops elevated to Cardinals.
- Feb. 22.** Egyptians carry out violent anti-British riot.  
General Yamashita, former Japanese commander in Philippines, hanged in Manila.
- Feb. 24.** Juan D. Perón elected President of Argentina.
- Mar. 1.** Bank of England nationalized.
- Mar. 4.** U.S., Great Britain, and France urge Spanish people to overthrow Franco.
- Mar. 6.** Japan drafts new Constitution, abolishing military services and making war unconstitutional.
- Mar. 10.** Italy holds first free election since 1922.
- Mar. 11.** Herbert H. Lehman resigns as head of UNRRA; replaced by Fiorella H. LaGuardia.
- Mar. 13.** General Motors strike ends with minimum 18½-cent per hour increase.  
Soviet troops evacuate Mukden.
- Mar. 15.** Prime Minister Clement Attlee offers India full independence.
- Mar. 18.** Poland and Yugoslavia sign treaty of mutual assistance.
- Mar. 19.** M. Shvernik elected President of Soviet Union.
- Mar. 25.** Iran appeals to Security Council on presence of Soviet troops.
- Mar. 27.** U.S. and Great Britain settle lend-lease.  
Andrei A. Gromyko, the Soviet delegate to the United Nations begins 13-day boycott of Security Council in protest against retention of Iran's complaint on the agenda.
- Mar. 29.** French Assembly passes measures to nationalize gas and electrical industries.
- Mar. 31.** Rightists win first postwar elections in Greece. Under John L. Lewis 400,000 bituminous coal miners strike for higher wages and welfare fund contributed by employers.
- Apr. 2.** U.S. civilian production hits new peak of \$150 billion a year.
- Apr. 3.** General Homma, who ordered Bataan Death March, executed in Manila.
- Apr. 4.** Soviet Union agrees to withdraw troops from Iran by May 6.
- Apr. 5.** Soviet Union and Iran sign oil agreement.
- Apr. 10.** Poland calls on Security Council to act against Franco regime in Spain.  
Japanese vote in first free parliamentary elections since 1932.
- Apr. 18.** League of Nations dissolved.  
U.S. recognizes Tito Government in Yugoslavia.
- Apr. 23.** Security Council refuses to drop Iran case from agenda.  
Manuel A. Roxas elected President of the Philippines.
- Apr. 25.** Council of Foreign Ministers meets in Paris to draft peace treaties for Italy, Rumania, Bulgaria, Hungary, and Finland.
- Apr. 29.** U.S. proposes treaty with Allies to keep Germany disarmed for 25 years.
- May 5.** France rejects proposed Constitution in referendum.
- May 6.** Council of Foreign Ministers reach impasse on Trieste; Russia backs Yugoslavia on demands, while Western Allies support Italy.  
Russia abandons claim to trusteeship over Italian Tripolitania.
- May 7.** Great Britain promises to evacuate troops from Egypt and negotiate new treaty.
- May 9.** King Victor Emmanuel III of Italy abdicates; is succeeded by Crown Prince Humbert.
- May 13.** Greek Parliament holds first meeting in ten years.
- May 15.** President Truman seizes railroads as strike threatens.
- May 16.** Great Britain offers India a home-rule plan within the framework of a Hindu-Moslem federal union.  
British troops leave Egypt.  
Shigeru Yoshida becomes Japanese Premier.
- May 17.** Marshal Antonescu, wartime Rumanian Premier, sentenced to death.
- May 23.** Strike stops all U.S. railroads.

# Memorable Dates of 1946—Continued

**May 25.** Railroads resume operation as unions accept President Truman's terms of 18½-cent hourly increase.

Trans-Jordan declared independent.

**May 26.** Communists win Czechoslovak elections.

**May 29.** Coal strike ends with miners receiving modified welfare fund.

Mufti of Jerusalem escapes from France.

**June 2.** Election in Italy abolished monarchy; Christian Democrats win.

French elections give victory to Popular Republican movement with Communists second.

**June 3.** War crimes trials open for twenty-seven Japanese war leaders.

**June 6.** Fred M. Vinson appointed Chief Justice of U.S. Supreme Court.

**June 10.** Tito Government of Yugoslavia opens trial for General Draja Mihailovitch, accused of collaborating with Nazis.

**June 11.** President Truman vetoes Case Bill curbing strikes.

**June 12.** Foreign Minister Bevin claims entrance of 100,000 Jews into Palestine would stir Arab opposition.

**June 14.** United Nations Atomic Energy Commission holds first meeting.

**June 15.** Council of Foreign Ministers resumes conference in Paris.

**June 19.** Russia and the United States differ on plans for control of atomic energy.

Georges Bidault elected provisional President of France; elected Premier on June 24.

**June 20.** Council of Foreign Ministers postpones for a year the disposition of Italian colonies.

**June 26.** Russia uses veto power three times to keep the Spanish question on Security Council agenda.

**June 28.** Chester Bowles resigns as OPA chief.

**June 29.** British troops arrest 2,718 Palestinian Jews in effort to capture terrorists.

**July 1.** Atom bomb dropped in first Bikini Atoll tests destroys eleven and cripples twenty-five ships.

Sarawak ceded to Great Britain.

Dr. Beel heads Netherlands Coalition Government.

**July 3.** Trieste internationalized by Council of Foreign Ministers.

**July 4.** Independence of the Philippines proclaimed.

**July 10.** Foreign Minister Molotov indicates that Russia wants to see a centralized Germany; demands \$10 billion in reparations from Germany.

**July 13.** U.S. loan of \$3,750,000 to Great Britain approved by Congress.

**July 15.** General Mihailovitch sentenced to death by Yugoslavia; executed on July 17.

**July 19.** Andrew J. May, chairman of the House Military Affairs Committee, subpoenaed by the Senate to explain his connections with a munitions combine.

**July 20.** Admiral Kimmel and General Short, commanders at Pearl Harbor, blamed by congressional investigating committee for negligence in Japanese attack on Pearl Harbor.

**July 21.** Great Britain rations bread and flour.

President Villarreal of Bolivia killed by revolutionists.

Turkish general election gives victory to People's Party.

**July 22.** Members of Jewish underground in Palestine bomb British headquarters, killing 91.

World Health Organization approves constitution in New York.

**July 25.** Second atom bomb at Bikini explodes under water, sinking 95,220 tons of shipping.

Congress passes new OPA bill.

**July 26.** Congress turns U.S. atom control over to a civilian board.

**July 29.** Peace conference of 21 nations opens in Paris to discuss peace treaties for Italy, Hungary, Rumania, Bulgaria, and Finland.

Great Britain and the U.S. agree to merge zones in Germany.

**Aug. 1.** President Truman approves civilian control of atomic energy.

**Aug. 2.** General Falkenhorst, former German commander in Norway sentenced to death; later commuted to 20-years imprisonment.

**Aug. 5.** General İnönü reelected President of Turkey.

**Aug. 12.** British intercept Jewish refugee ship en route to Palestine, interning passengers on Cyprus.

**Aug. 19.** U.S. Army air transport shot down over Yugoslavia; strong note of protest sent by the U.S. on the following day.

**Aug. 24.** Pandit Nehru heads interim Government in India.

**Aug. 29.** On the applications for United Nations membership, the Security Council approves Sweden, Iceland and Afghanistan; Russia vetoes Eire, Portugal and Trans-Jordan; other Council members veto Albania and Outer Mongolia.

**Sept. 1.** Monarchy retained in Greece after referendum and King George II restored to throne.

**Sept. 4.** Soviet Ukraine tells Security Council that British troops threaten peace in Greece.

**Sept. 5.** Seamen's strike, begun by A.F. of L., paralyzes U.S. shipping.

**Sept. 6.** Austria and Italy agree on South Tyrol.

**Sept. 8.** Bulgaria referendum abolishes monarchy for republic.

British war veterans, unable to find places to live, seize private property in London.

**Sept. 10.** Great Britain and Russia sign trade agreement. Congress restores price ceilings on meat.

**Sept. 13.** A.F. of L. seamen return to work with new wage scales.

**Sept. 14.** C.I.O. seamen strike to obtain wages equivalent to A.F. of L. scale.

**Sept. 15.** Shipping strike ends.

**Sept. 18.** New Constitution approved in Brazil.

**Sept. 20.** President Truman forces resignation of Secretary of Commerce Henry A. Wallace. Russian demand for investigation of British troops in Greece rejected by Security Council.

**Sept. 24.** Generalissimo Stalin says there is no real danger of war.

**Sept. 28.** Australian general election gives victory to Labor party.

Yugoslavia finds Trieste provisions in treaty with Italy unacceptable.

**Sept. 30.** Nuremberg War Crimes tribunal condemns 11 Nazis to death, including Goering, Keitel, and Jodl; sends Hess and others to prison and acquits Schacht, Papen, and Fritzsche.

**Oct. 1.** New shipping strike begins.

**Oct. 3.** Arabs publish plan for independent Palestinian state.

**Oct. 4.** President Truman urges admittance of Jews into Palestine.

**Oct. 6.** Churchill asserts his intention to remain in politics as head of the Conservative party.

**Oct. 9.** Paris Peace Conference adopts draft of Italian treaty.

**Oct. 10.** Chiang Kai-shek reelected President of the Chinese Central Government.

Rumanian draft treaty accepted by Paris Peace Conference.

connection with the Civil War. Its charter, passed by Congress and approved by President Lincoln in 1863, provides that it "shall, whenever called upon by any department of the Government, investigate, examine, experiment, and report upon any subject of science or art, the actual expense of such investigations . . . to be paid from appropriations which may be made for the purpose, but the Academy shall receive no compensation whatever for any services to the Government of the United States."

The membership of the Academy is limited to 450 citizens of the United States and 50 foreign associates. There are no applications for membership. Nominations are presented by the sections representing different sciences.

In order to permit the organization of the nation's scientific resources on a more inclusive scale than was possible within the membership of the Academy itself, the National Research Council was organized by the National Academy of Sciences at the request of President Wilson in the spring of 1916, and was established on a permanent basis on May 11, 1918, by Presidential Executive Order, "to promote research in the mathematical, physical, and biological sciences, and in the application of these sciences to engineering, agriculture, medicine, and other useful arts, with the object of increasing knowledge, of strengthening the national defense, and of contributing in other ways to the public welfare."

The membership of the Council is composed largely of appointed representatives of approximately eighty-five of the major scientific and technical societies of the country, together with representatives of certain other research organizations, representatives of Government scientific bureaus, and a limited number of members at large. These members are appointed by the President of the National Academy of Sciences. Serving on Committees of the Council are approximately 1,800 outstanding scientists.

The Academy-Research Council does not maintain scientific laboratories but functions through sponsorship of conferences, technical committees, surveys, scientific publications, and administration of funds for research projects and fellowships.

The administrative costs of the Academy and Council are charged against the income of a permanent endowment given, together with the building, by the Carnegie Corporation. Financial support of scientific projects is obtained from contracts with governmental and private agencies and from special grants from foundations, societies, and individuals.

Many highly confidential projects contributing directly to the war effort were financed through contracts with the Office of Scientific Research and Development, War Production Board, War and Navy Departments, and other Federal agencies, as well as by grants from various sources.

The Academy issues the Proceedings, Scientific Memoirs and Biographical Memoirs. An Annual Report is made to Congress and published.

The Council issues a series of Bulletins, Reports, and Circulars. A list of publications, with prices, is available upon request. Academy officers: Frank B. Jewett, President; Luther P. Eisenhart, Vice President; Detlev W. Bronk, Foreign Secretary; F. E. Wright, Home Secretary; J. C. Hunsaker, Treasurer; G. D. Meld, acting Executive Secretary. Council officers: Detlev W. Bronk, Chairman; G. D. Meld, acting Executive Secretary.

The building of the National Academy of Sciences and the National Research Council is

located at 2101 Constitution Avenue, Washington 25, D.C.

**ACCIDENTS.** The trend of accidental deaths in 1946 was relatively unfavorable, according to records for the first ten months, but there was a marked improvement after March. Estimates made by the National Safety Council were as follows:

Month	1946	1945	Change
January	8,900	8,000	+11%
February	8,100	7,200	+12%
March	8,400	7,600	+11%
April	7,700	7,200	+7%
May	7,800	7,500	+4%
June	8,100	8,100	0
July	8,800	8,700	+1%
August	8,100	8,000	+1%
September	7,700	7,400	+4%
October	7,800	8,100	-4%
Ten Months	81,400	77,800	+5%

**Motor Vehicle Accidents.** The large increase in deaths in the early months was principally in motor vehicle accident fatalities. This was in part the result of the great expansion in use of automobiles after gasoline rationing was discontinued. Vehicle mileage in January, February, and March was 41 percent more than in the same months of 1945, and deaths were up 50 percent.

In May President Truman called the Highway Safety Conference, a three-day meeting of state and city motor vehicle officials and non-governmental organizations working in the accident prevention field. The Conference was called to determine the best available methods of enforcement, engineering, and education to reduce the motor vehicle accident toll. The effectiveness of the Conference is shown by the death record in succeeding months. In June and July deaths were only 23 percent above 1945, although mileage was up 50 percent. The August death toll was 17 percent more than in 1945, while mileage rose 36 percent. In September and October—months without gas rationing in either year—deaths numbered one percent less than in 1945 although mileage, according to preliminary estimates, was about 27 percent greater. The outlook is indeed encouraging.

The ten-month total of motor vehicle deaths was 27,520, a 25 percent increase from 1945, but still 14 percent less than prewar 1941.

**Public Non-Motor-Vehicle Accidents.** Deaths of civilians from public accidents not involving motor vehicles numbered approximately 13,700, or 400 more than occurred in the same months of 1945. There were fewer deaths from railroad and street car accidents, according to preliminary reports. Fatal falls and drownings numbered about the same as in 1945. However, there were increases in deaths from burns and firearms accidents.

In children five to fourteen years old there was recorded a decrease, but in all other age groups there were recorded more deaths than in 1945.

**Occupational Accidents.** The 1946 ten-month death total for civilian occupational accidents was approximately 13,700, an increase of 300 from 1945. Information is not yet available on the distribution of deaths by industry, but the large gain in construction employment indicates that at least a part of the increase was in that group.

Reports in accident prevention contests indicate that the trend of non-fatal injuries during 1946 was upward, although the change apparently was not large.

**Home Accidents.** There were approximately 27,200 deaths of civilians from accidents on home premises, during the first ten months of 1946, or 500

more than occurred in the same months of 1945. Falls, which account for about half of the total, showed little change; but deaths from poisons, burns, mechanical suffocation, and firearms accidents all increased. The increases were partly offset by a decrease in asphyxiations.

The rise in deaths was confined to the age groups including persons five to forty-four years old. There was a small decrease for persons forty-five to sixty-four years old, while children under five and persons sixty-five years and older had about the same number of deaths as in 1945.

**Military Personnel.** Accidental deaths of military personnel in the United States dropped from about 6,100 in the first ten months of 1945 to 2,700 in the same months of 1946. This is a reflection of the decrease in the number of men and women in the Armed Forces, and probably of the even greater reduction in some of the more hazardous types of training.

A. D. BATTEY.

**ADMIRALTY ISLANDS.** A group of islands (Manus is the largest) in the Australian mandated Territory of New Guinea, of which it forms the Manus district. Total area: 800 square miles. Population (June 30, 1941): 14,234 natives. Capital, Lorengau (on the island of Manus).

**ADVANCED STUDY, Institute for.** An institution of higher learning founded in 1930, by Mr. Louis Bamberger and Mrs. Felix Fuld. The Institute is different in character from any other American educational institution in that it is planned for students who wish to pursue advanced research beyond the level of the doctor's degree. It has no tuition fee, no routine requirements, no examinations, and it awards no degrees. The work is largely individual, though there are seminars and courses of lectures in some subjects. Since the individuals who attend the Institute are in many cases extremely eminent in their subjects, the word "student" is not used, but they are rather designated as "members." The two groups, the faculty, and members of the Institute are in reality a body of scholars working together.

The Institute is supported entirely by endowment. Located at Princeton, New Jersey, the Institute has no official connection with Princeton University, though there is a great deal of informal cooperation between the two institutions.

In 1946 the Institute embarked upon a project, under the direction of Professor von Neumann, of building a general purpose electronic computer. The design of this piece of equipment takes advantage of the experience of various laboratories with building devices of this sort during the war. The computer which is planned for the Institute is expected to be simpler, more rapid, and more versatile than any existing machine. In the construction of this computer the Institute has the support of the Army Ordnance Department and the cooperation of the Princeton Laboratories of the Radio Corporation of America and the Physical Laboratories of Princeton University.

The members of the Economics Section of the League of Nations, who have been in residence at the Institute since 1940, have now been appointed to the United Nations and transferred to the headquarters on Long Island. Members of this group were invited to Princeton in the dark days of 1940 when it looked as if the German armies might overrun Switzerland. The purpose of the Trustees of the Institute was to preserve the group intact and conserve the experience of its members for

the benefit of whatever international organization might succeed the League of Nations after the war, thus saving for the new organization, the immense store of technical knowledge and experience gathered by these experts, in twenty years of work for the League. That purpose has now been fulfilled.

Bulletin No. 12 of the Institute for Advanced Study, published in October, 1946, gives in as much detail as military secrecy will allow, the war record of the members of the faculty. Director: Dr. Frank Aydelotte. Director Emeritus: Dr. Abraham Flexner. Headquarters: Fuld Hall, Olden Lane, Princeton, New Jersey.

**ADVENT MOVEMENT.** A religious movement which originated in America with William Miller (1782-1849), who believed in the imminent, personal second coming of Christ. There are six Adventist bodies in the United States, the largest being the Seventh-day Adventist Denomination, formally organized in 1860, which observes Saturday as the Sabbath of the Scriptures. Headquarters, Takoma Park, Washington, D.C.

**ADVERTISING.** Advertising launched into the unpredictable business waters of 1946 with a real war record of accomplishment behind it. During the war years it had devoted more than \$1-billion of time and space, contributed by American business, to keeping Americans informed about war bonds, the armed forces, the merchant marine, civilian nurses, V-mail, food, conservation, salvage, manpower, and numerous other subjects bearing upon the united interests of the nation. It cooperated with more than two dozen government departments and agencies in more than 100 home-front campaigns. It greatly broadened its scope as a means of disseminating all manner of useful and needed information for the purpose not only of selling goods but also of furthering civic and patriotic ends.

As the 1946 months slipped by, business and industry turned to the use of this effective tool in the rebuilding of a full peacetime economy, though much space and time was still devoted to interests other than the selling of goods and services.

Advertising was used, for instance, in efforts to compose the differences between labor and management that resulted in crippling strikes during the course of the year.

The Advertising Council, which had furthered the national purpose magnificently as the War Advertising Council, added the pressure of advertising to the National Safety Council's drive to cut down the rising tide of accident casualties.

The Chicago Health Department used advertising with telling effect in its anti-venereal disease drive. Many other non-commercial uses of advertising climbed into public attention during the year via the printed word and the air waves, such as the New York Stock Exchange's campaign to clear up misconceptions, explain the Exchange's functions, and protect the public; the Chesapeake & Ohio Railroad's campaign to modernize railroad passenger service; and various campaigns to re-sell the idea of free enterprise to a confused public.

In accomplishing its commercial and non-commercial tasks, 1946 advertising set a new high mark of expenditure. In spite of many confusing and harassing experiences, it accounted for the disposition of more than \$2.6-billion, compared with less than \$2.4-billion spent in 1945.

This expenditure supported an economy reconverting from war to peace and characterized by such facts as sales in retail stores that, in the first

seven months of 1946, were at an annual rate of \$93-billion—"the largest in the nation's history," according to the Department of Commerce.

**Legal Developments.** On the legal front, one significant development during 1946 was the passage of the Lanham Act, a rewriting of the copyright law which provides for the first time for the registry of service marks, including such things as the identifying devices of radio commentators, and for their incontestability after five years of undisputed use.

Another development of widespread interest was a change in Federal Trade Commission policy, known as the Truman Plan, replacing citations of individual companies for isolated violations of trade practice laws with fair practice codes developed from conferences with all interested parties.

A third legal development during the year was the U.S. Supreme Court's formal decision upholding a lower court's verdict that the use of \$40-million for advertising by American Tobacco Company, Liggett & Myers, and R. J. Reynolds, constituted a case in restraint of trade and monopoly. "Such tremendous advertising," Justice Burton held in the court's unanimous opinion, "is a widely published warning that these three companies possess and know how to use a powerful offensive and defensive weapon against new competition."

**Reconversion Pains.** Advertising's progress through 1946 was not without its setbacks. A strike of 6,000 truckmen blacked out newspaper advertising in New York City and other centers. Scarcities of materials and, in some industries, of skilled workers slowed the wheels of production. A midyear break in the stock market started a downward trend that somewhat dampened the high hopes of earlier months.

Paper shortages still plagued publishers, and rising costs plagued everybody. At the end of 1946, the costs of advertising were up 20 to 35 percent and still rising. Large national advertisers were predicting greater flexibility in their 1947 plans than ever before. The happy, hopeful spirit that followed V-J Day gave way to disturbed emotions and uncertainty.

These difficulties bore on different departments of the advertising industry with unequal force, but, despite them, the industry as a whole turned in a record year. A spot check of the several major advertising classifications will help to clarify that record.

**Magazines.** National magazine advertising hit an all-time high in 1946, accounting for an expenditure for space of approximately \$375-million, compared with \$305-million in 1945. The 1929 pre-depression peak was \$197-million.

An interesting sidelight indicative of the high activity in national magazine advertising was the October issue of *Ladies Home Journal*, which carried the largest dollar volume ever appearing in any issue of any magazine in publishing history—over \$2-million.

During the year, national magazines also set a new high in readership. In the twenty-five year period from 1921 to 1945, for example, national magazine members of the Audit Bureau of Circulations showed a circulation growth from less than 50-million to just short of 150-million. About 62 percent of this circulation was sold by newsstands, copy by copy; about 34 percent was sold on a subscription basis. Circulation growth continued throughout 1946.

**Newspapers.** The money spent for advertising space in newspapers during 1946 exceeded three-quarters of a billion dollars. In this field, the year

was marked by the publication of Neil Borden's book, *National Advertising in Newspapers*, which represents probably the most important research into this problem that has ever been done. Another notable project was begun in the organization of the American Newspaper Advertising Network, an experiment in applying to national advertising in newspapers the basic principles of network radio advertising. Considerable expansion took place in the use of color in newspaper advertising.

The American Newspaper Publishers Association's Bureau of Advertising, with a membership of 1,063, representing some eighty percent of the daily newspaper circulation in the United States and Canada, initiated an active program of service to advertisers and agencies. The Bureau's program includes such services as making available market and media information for every county in the United States, measurement of the flow of goods through retail stores, and a continuing study of newspaper reading.

The 1946 Directory of County and Suburban Town Newspapers listed 8,504 non-daily newspapers (223 less than for 1945) with an aggregate circulation of 14,321,000 in towns under 50,000 (165,000 more than for 1945).

**Radio.** Despite some cancellations in the first half of the year, radio advertising volume for 1946 approximated \$190-million of gross advertising revenue, comparing favorably with its 1945 volume. Some advertisers who had cut down time schedules because of shortages and other uncontrollable factors were replaced by companies which had been awaiting favorable openings. Others reinstated their programs later in the year.

The Federal Communications Commission anticipated an increase in the number of television stations within the next few years, from the six operating in mid-1946 to between two hundred and three hundred.

Some progress is reported in color video, although general acceptance by the industry of the switch to the higher wave lengths, necessary for color video broadcasting, may continue to be slow. According to the magazine *Tide*, present television broadcasting channels for New York stations range from 54 to 82 megacycles, while Columbia Broadcasting System used the 480 to 496 megacycle area for experimental color video.

**Business Papers.** From the depression low in 1933, the upward trend of expenditures for advertising space in business papers has increased some 500 percent. In 1946, it is estimated that advertisers will spend \$111-million in business papers. This represents an increase of less than 4 percent over the 1945 estimate of \$107-million reported in the 1946 issue of *Brad-Vern's Reports*.

The greatest expansion in business paper use came during the war years. The year 1945 registered a gain of 21 percent; 1944, a gain of 22 percent; and 1943, a gain of 36 percent. Reconversion from wartime to peacetime operations, strikes, material and manpower shortages, were major deterrents to the continued expansion of business paper advertising.

The 1946 trend of advertising copy addressed to business and technical men has been away from the generalized institutional type toward the more factual and informative as inter-product and inter-company competition for the major industrial and business markets has sharpened. This was a natural result of industry's beginning attempt to find peacetime uses for its war-expanded production facilities.

**Direct Mail.** About half a billion dollars a year is spent for direct mail and mail order advertising.

The field is huge and diverse. One of the great mail order houses spends more than \$500,000 a year for postage alone, and more than one dollar each, on its big catalogs. Magazine publishers spend about half of their advertising money for direct mail solicitation of subscriptions. Wholesalers, colleges and charities, dunning for alumni dues and for contributions; department stores, corporations sending reports to stockholders; manufacturers' mailing house organs and other sales literature, swell the volume of advertising directed to individuals via the mails.

**Other Advertising.** The use of *outdoor advertising* for the first six months of 1946 was estimated to be 25-30 percent over the same 1945 period.

The use of *films*, both moving picture and slides, increased during the year. According to a study made by the Association of National Advertisers, about 70 percent of this use was for promotion or educational purposes, while approximately 30 percent was used for sales training.

*Sampling and premiums* appear to be on the way back, also, after their wartime suspension. Lack of manpower has retarded the progress of sampling plans to some extent, while drastic shortages in premium-size packages have held up the offerings of many planned premiums.

The year's end found many advertisers facing the need to tailor 1947 schedules to fit fixed budgets to rising costs. Only a minority were planning to meet this situation in whole or in part with increased appropriations.

J. R. VAN ARSDALE.

**AEGEAN ISLANDS.** The islands in the Aegean Sea near Turkey in Asia; under Italian rule from 1912 to 1944. (see below under *Political Future*). They include the Dodecanese group with Rhodes and Castelrosso. Their area and population together with their Italian names in parentheses are given in the accompanying table.

Island	Sq. mi.	Pop. (1936)
Astropalia (Stamalia) . . . . .	44	2,006
Casoe (Caso) . . . . .	27	1,890
Castelrosso . . . . .	4	2,238
Cos (Coo) . . . . .	111	19,731
Kalymnos (Calino) . . . . .	49	15,247
Karchi (Calchi) . . . . .	12	1,481
Karpathos (Scarpanto) . . . . .	118	7,770
Leros (Lisso) . . . . .	28	13,657
Lipso (Lisso) . . . . .	7	977
Nisyros (Nisiro) . . . . .	18	3,391
Patmos (Patmo) . . . . .	22	3,184
Rhodes (Rodi) . . . . .	545	61,888
Symi (Simi) . . . . .	25	6,195
Tilos (Piscopi) . . . . .	25	1,215
Total . . . . .	1,035	140,848

The total population in 1936 (140,848) comprised 85 percent native, 12 percent Italian, and 3 percent foreign. On January 1, 1940, the total population was 122,000. Chief towns (1936 populations): Rhodes (capital) 27,466; Kalymnos 15,247; Cos 9,852; Symi 6,195.

**Production, etc.** The principal agricultural products consist of grapes, olives, tobacco, oranges, and vegetables. Sponge fishing, and the manufacture of artistic pottery and tiles, tobacco, wine, olive oil and oriental carpets are the chief industries. Trade (1938): imports 157,421,000 lire; exports 21,851,000 lire (lira was worth \$0.0526 for 1938). Roads (1940): 391 miles.

**Political Future.** Under the terms of the armistice granted to Italy by the Allies during September, 1944, Italy officially relinquished her hold over the Dodecanese. German occupation continued until the unconditional surrender of Germany to the

Allies which became effective on May 8, 1945. Thereafter the islands were subject to Allied control. Italian Foreign Minister de Gasperi in a letter dated August 22, 1945, to United States Secretary of State James F. Byrnes agreed to cede the Dodecanese to Greece. On June 27, 1946, the Big Four Foreign Ministers, meeting in Paris, officially awarded all the Italian Aegean Islands to Greece.

**AERONAUTICS.** As was to have been expected, the year 1946 was a transition period for all phases of aviation. Its two largest segments, manufacturing and transport, underwent the same reconversion difficulties as other industries, reached new heights in some instances, as did other industries, and toward the end of the year were going through the same "shaking down" process as the general economy.

Examining this cycle, aviation observers were inclined to accept it as evidence of one development they had predicted during the war—that aviation had taken such giant strides that in the postwar era it would blossom into a full-fledged part of the nation's economic life. In general, during the year, the greatest overall progress was made in air transport, with thousands of miles of new routes, both domestic and international, being activated and three new fields for air transport activity opening up: cargo, local and non-scheduled traffic. Remarkable achievements, however, were announced in manufacturing and research including the first flight of a United States-built rocket-powered aircraft, and the development and flight of a giant flying wing aircraft, both accomplishments stemming from military contracts.

**Air Transport.** Although even before the end of the war, the commercial airlines had begun getting back from the Army and Navy transport planes requisitioned early in the war, and receiving other aircraft from surplus stocks, the additional seating capacity made available in this manner was not truly manifested until early in 1946 when four-engined aircraft which had been months in the reconversion process, were put into service. The first was put into operation by Pennsylvania Central Airlines (Capital Airlines) on January 20. This was a DC-4, known in the Army as a C-54 and in the Navy as an R5D. It had been designed before the war as a joint airline-Douglas Aircraft Corporation venture as a larger sister-ship of the famous two-engine DC-3.

The effect of the appearance on the airways of the DC-4 and of the four-engine *Constellation*, built by Lockheed Aircraft Corporation, which was put into service a few months later, is shown by the capacity statistics of the airlines. On December 15, 1945, domestic and international carriers were operating 495 planes with a total seat capacity of 10,889. On December 15, 1946, the number of planes had increased to 816, but the seats available were far greater proportionally, 25,541.

The availability of new and reconverted aircraft all through the year was apparent in the expansion and operation of both domestic and international airline routes. Domestic route mileage climbed to 90,000 miles during the year, an increase of about 22,000 miles. In the international field, 68,000 new route miles were authorized during the year, bringing the total to approximately 175,000 miles. For the twelve months, it was estimated that domestic carriers flew 6,000,000,000 revenue passenger miles, a gain of about 72 percent over 1945. Express and freight shipments on domestic certificated airlines increased 57 percent, to 37,000,000 ton miles. Miles flown domestically totaled

300,000,000. During the year 1946, airmail carried decreased to an estimated 32,000,000 ton miles, a drop of about 50 percent, credited chiefly to a reduction in armed forces mail and a revision of business to a slower, peacetime tempo.

Internationally, the increases were even more spectacular. A gain of 118 percent was registered in passengers carried, the number being 1,000,000. Revenue passenger miles totaled 1,000,000,000, up 139 percent. Express and ton miles flown increased 175 percent to 24,000,000. In contrast to the domestic situation, airmail in international operations increased about 30,000, to 6,000,000 ton miles. Miles flown reached 67,000,000, a gain of 88 percent.

At the base of this expansion was the granting of new route certificates by the Civil Aeronautics Board. Due to the necessity of concentrating all energy on the war program, the CAB had adopted a policy of deferring route applications. After the victory in Europe decisions in some cases began to be announced, but the real flood did not come until 1946. During the year, the CAB decided seven cases, creating nine new domestic airlines, with a total of about 11,000 new route miles, besides adding mileage to existing carriers and granting new international routes to present United States airlines.

The CAB, in its domestic decisions, in effect created a new class of Federally-certificated air carriers, the local service airlines, commonly, somewhat erroneously, known as feeders. They do feed some traffic to trunk lines but they render service between smaller cities and connect these cities to large cities in the trade area. Much of such traffic does not "feed" into any other transportation system. All of the domestic decisions during the year on new routes for new carriers, five in number, involved local service in regions. In this type of service, in which an airline serves frequent stops over a small system the awards have ranged from about 500 to 1,900 route miles. Essair, Incorporated (now Pioneers Airlines) was first certificated during the war to render this type of service over a route lying wholly within the state of Texas. All of these certificates, including the original one to Essair, or Pioneer, are for three years. After exhaustive investigation of the local service theory during the war, the Board decided to authorize certain carriers in specific regions for a limited time in which to gauge the economic potentials of this type of service. By the end of November, 1946, the CAB had certificated 10 local service carriers, including Pioneer, with a total of 11,728 route miles.

Few of the newly-authorized local service air carriers had begun operations by the end of 1946. By December several of the local service airlines had given indication that they intended to ask the Board for extensions to their allotted mileages. Complicating the local service situation was the lack of an airplane specifically designed for this type of traffic. In mid-year, Lockheed Aircraft Corporation, which had already test flown its 14-passenger *Saturn* (see plane listing below), especially designed for short-haul traffic, announced it would not put the aircraft into production. Boeing Aircraft Company, which had planned a 20-passenger plane, the *Model 417*, for the same purpose, similarly announced a suspension in production plans. That left two aircraft tailored to the needs of local service operators still planned, the 20-passenger *Model 34 Beechcraft* and the *Northrop Pioneer*. Local service airlines were forced to plan initial operations with aircraft which were too small,

or the surplus DC-3 types. The majority of the operators chose the DC-3.

The CAB's decisions in route cases, while giving promise of an increased and better integrated air transport system, was largely expansion on paper due to the time it takes to begin operations over a newly-certificated route. The real expansion during 1946 came from the already-certificated carrier's adding planes and more schedules to their existing systems. For the first six months of the year, revenue passenger miles were 2,581,608,616, as against 1,443,195,845 in the same period of 1945, an increase of 78.88 percent. As an index to the effect of more and larger planes, however, the passenger load factor (average percentage of available space occupied on a flight) dropped in the first half of 1946 to 84.28 from 87.76 in the first six months of 1945. By the end of the year the percentage was from 75 to 80 for large lines, and 60 to 65 for the others.

This same situation applied in the international field, particularly on the trans-Atlantic routes. As fast as equipment became available, the airlines added new routes and flights. In the last half of the year, the passenger load factor decreased considerably due to the fact that there was a tremendous backlog of westbound reservations in Europe; some lines were booked for five and six months ahead. This resulted in a drop in east-bound bookings as passengers were hesitant to fly to Europe when they had no assurance of return passage for months.

The expansion in volume of service performed by the United States international air transport system, was already well underway by mid-year. On December 31, 1945, there were five carriers operating 108,681 route miles internationally; on July 1, 1946 eleven lines flew 127,611 route miles.

This physical expansion is probably the poorest measure of expansion and gains in international air transport. Far more important—because without them no route expansion would be possible—were activities in the diplomatic and political fields. At the International Civil Aviation Conference in Chicago in 1944, principal nations of the world agreed to the establishment of a temporary international organization—pending ratification of a convention for a permanent agency—with broad advisory powers on technical safety and navigation problems. At that time, no solution acceptable to the nations with the greatest stake in international air transport, the United Kingdom and the United States, could be found to economic matters such as, rates, routes, and frequency of schedules. This aspect was finally put over for future discussion.

In January and February, 1946, representatives of the governments of the United States and the United Kingdom met in Bermuda to attempt to work out, in a bilateral agreement, the matters upon which agreements could not be achieved at Chicago. After several weeks of debate, the representatives of both governments approved a compromise. At Chicago, the British had held fast to the argument that the international regulation of rates and the apportioning of capacities and control of frequencies must be a part of any international air transportation agreement. The United States, on the other hand, maintained that such provisions would tend to cripple international air transport and to retard its development very seriously. At Bermuda, each of these nations made concessions from their original positions in order to achieve an agreement. The United Kingdom acceded to the view that the agreement should not provide for any

division of capacity or control over frequencies except in certain contingencies where it might be found that the air carriers of the other party had been engaging in practices which "unduly affect" the air carriers of the other party. On the other hand, the United States acceded to the view that rates charged by an international air carrier of either of the two countries should be subject to governmental review, first by the two countries in consultation and, if they could not agree, by the international air organization established as a result of the Chicago Conference. Also included in the Bermuda agreement was a provision permitting the carriers of either country to pick up traffic or send on traffic in the other country destined to or coming from a third country. This is the right which has so commonly been referred to as the "fifth freedom."

The Bermuda agreement was very important in that it broke the log jam between the world's two leading air transport nations and, in a sense, set a pattern for bilateral transport agreements thereafter to be negotiated by the United States with a number of countries. Bermuda-type agreements have now been made with France, Belgium, Greece, Egypt, India, China, the Philippine Islands, Australia and New Zealand, as well as with Brazil and various other countries in Latin America. The completion of these bilateral agreements, and others which had been made before the Bermuda agreement, go far toward permitting the United States air carriers to realize effectively a route pattern first enunciated by the CAB in the summer of 1944. All of the agreements made by the United States, on a bilateral basis, and which are now in effect are as follows: Belgium, Brazil, Canada, Ecuador, Czechoslovakia, Denmark, Eire, Egypt, France, Greece, Iceland, India, Lebanon, Norway, Philippine Islands, Portugal, Spain, Sweden, Switzerland, Turkey, United Kingdom, New Zealand, Australia, Uruguay, Peru, China.

It should be made clear that the Bermuda agreement is in no way dependent or related to the arrangement under which the International Air Transport Association, composed of all, or substantially all, of the international operators, reaches a certain agreement relating to international rates. In the United States, although the CAB does not have control over the rates of international air carriers, no agreement between air carriers can be made affecting rates or other phases of air transportation without the necessity of securing the approval of the CAB which can be given only if it finds that the agreement is not contrary to the public interest. It just happened that the CAB approved this International Air Transport Association machinery for reaching rate agreements and submitting them to the CAB for its approval about the same time as the Bermuda agreement was made. The first rates submitted to the CAB by IATA were disapproved by the Board on the ground that there was no economic data to support them. This rate structure was later revised by IATA, resubmitted to the Board with economic supporting data, and the revised rates so submitted were approved. These rates, as so revised, reduced international fares substantially.

CAB's approval of the IATA machinery for the fixing of rates and other traffic matters was to last for one year. This matter will be up for consideration by the CAB in February of 1947.

Following the Bermuda agreement and the first Interim Assembly of the Provisional International Civil Aviation Organization in Montreal in May and June, 1946, the United States enunciated the

International Air Transport Agreement, which was one of the various agreements offered by the United States at the Chicago Conference. This agreement was always controversial because it provides for the establishment of international routes, if they are reasonably direct in their courses between the signatory states, without any economic control. The lack of economic control made this agreement quite unsatisfactory to the United Kingdom, to France, and to certain other nations. It had not been widely accepted and, in view of the intervening circumstances, it could not be accepted later by the large air transport operating nations of the world. The United States withdrew its support of that agreement. It is sometimes referred to as the "five freedoms agreement." Another reason for its denunciation was that, in all probability, the pattern of the Bermuda agreement was expected to become acceptable generally and, since it did provide for economic controls over rates, there seemed to be nothing but confusion resulting if the Air Transport Agreement were left standing.

During the year 1946, PICAQ, Provisional International Civil Aviation Organization, accomplished some outstanding work in the field of safety and in the standardization of technical provisions for the operation of international air lines throughout the world. Credit goes to the President of this organization, Edward Warner, and the Council of PICAQ which worked with him toward the achievement of real progress in this international field. A good number of regional conferences were held in various parts of the world and much progress was made toward the organization of international air transport and the standardization of basic procedures.

While these important matters were being handled by the aviation diplomats of all countries, the aviation policy-makers in the United States were also affesting the international air transport system. A committee of Congress once again refused to approve the "community company" proposal which would establish one airline to conduct all United States international operations. In July Congress ratified the convention establishing a permanent International Civil Aviation Organization. By late in the year, twelve nations had ratified the convention. Although twenty-six were needed to make it effective, little concern was aroused, because the Interim Assembly provided for simultaneous deposit of ratifications on March 1, 1947, and it was believed that most nations were merely delaying ratification action. The CAB decided the last of the major international cases, for routes across the South Atlantic.

The airlines had long planned for the enlarged system both domestically and internationally that began to take shape in 1946. They had obligated themselves heavily for new equipment, enlarged their staffs, opened new offices and, in the case of both old and new international carriers, set up world-wide traffic, maintenance and service organizations. All of these were necessary preliminary steps, even before the traffic, that would provide revenue to pay for these adjustments, could begin to develop. A number of the airlines reported losses for the first half of the year.

The result was the largest wave of new financing, at first mostly by public stock offerings, in air transportation's history. Following the break in the securities market in midsummer, financing was generally handled where possible through banks. One major airline, Trans World Airlines, suffered serious financial set-backs in the last half of the year through two events which, happening to hit

TWA hardest, still cast a shadow over the entire industry. The first was the grounding of all *Constellation* aircraft on July 13, following a fatal accident to one of the aircraft during a training flight by TWA pilots. There had been two previous cases of fire in this type of plane, neither resulting in fatalities, and the Civil Aeronautics Administration ordered the planes grounded until an investigation and hearing could be undertaken to determine if fire was an inherent hazard in the plane. The aircraft was subsequently absolved although several engineering changes were recommended and made. Meanwhile, sixty *Constellations* being operated by TWA, Pan American World Airways, American Overseas Airlines were grounded for about a month. Most of these aircraft were operated internationally. British Overseas Airways Corporation also grounded its *Constellations*. TWA, being the original sponsor of the plane, and being most heavily committed to it, was hardest hit financially by the occurrence. Among operators affected, the grounding caused a 30 percent decrease in revenue plane miles and ton miles, and a 40 percent decrease in revenue passenger miles.

Then, late in October, the first strike of pilots in airline history was called against TWA. It had been brewing for more than a year and involved pay rates for pilots and co-pilots on four-engine airplanes—which the airlines had not operated (with the exception of Pan American Airways) to any great extent before the war. The strike lasted 26 days and cost TWA several millions of dollars before arbitration by a special panel was agreed to and the pilots went back to work. The most significant aspect of the strike was that TWA was the first airline with which the union (Air Line Pilots Association) had negotiated on this subject. Shortly after January 1, 1947, the same matter was due to be discussed with the other large carriers, and the airlines' pilot payrolls were expected to be largely determined by the decision of the arbitration panel in the TWA case.

Because of labor costs and the declining passenger load factor, practically all airlines showed operating losses during the year and five asked the CAB for financial relief. A major part of this situation was the load factor. Before the advent of the DC-4, airlines generally figured they had to operate at an average of 60 percent of capacity to break even financially. Even by December 1946, operations with the DC-4 were still too new to show a generally accepted break-even point. The load factor began dropping early in the summer; by fall the decrease was visibly evident to the frequent air traveler, although it spurted temporarily in October. The major worry of the airline executives was whether or not operation could be sustained through the bad weather winter months.

While even severe weather en route seldom constitutes a hazard or an obstacle to an airplane, murky conditions above an airport can either shut off flights at the departure point, or slow down landings to such an extent that the plane in the "stack" above the field may not land for a long time (perhaps hours) after coming over the field. This situation has been known to disrupt schedules and back up planes at airports across the entire country. Solutions to the problem were sought on many fronts throughout the year. In February, the Army Air Forces held an all-weather conference which, although primarily to give the AAF information for its own attempts to establish an experimental all-weather airline, gave the airlines, too, detailed explanations of practically every navigational and landing-aid system. The CAA rushed

work on the installation of its own Instrument Landing System with the intention of having it in more than 100 fields by June, 1947. Government and industry joined in extensive tests at an experimental landing aids station at Arcata, California, where results capable of immediate commercial utilization were obtained with fog dispersal systems, improved approach and runway lights, and both CAA's Instrument Landing System and a war-born, radar system known as Ground Controlled Approach.

This latter operates on the well-known principle of a high-frequency beam being sent out, bouncing back from an obstacle on its course and being picked up on a radar scope. In the case of GCA, a controller on the ground can follow the course of the aircraft that intercepts the beam, and can direct the pilot by radio into the proper approach attitude and glide path to effect a landing. It is claimed that this system has demonstrated certain superiorities over CAA's ILS, but its initial cost is high and it needs highly-trained and skilled operators on the ground. In contrast, ILS is completely automatic. One of the other major differences in the two systems, and one which has been responsible for much of the controversy that surrounds them, is that ILS puts the responsibility for landing completely on the pilot. With GCA, the ground operator has the primary responsibility and both airline pilots and the airlines have shown some reluctance to put a ground operator in charge of the lives of a plane load of passengers. Despite this, both CAA and the airlines agreed to a test of GCA at three major airline terminals, Washington, New York and Chicago, where ILS likewise is installed. Beginning early in 1947, actual approaches in commercial operation will be made with ILS, and monitored with GCA, although a pilot may request that he be brought in by GCA.

Lack of dependability of schedules seemed to be a serious threat to continued volume growth of air traffic. Unless the airlines solve the weather problem their future will be seriously dimmed. When they do solve this *bête noir* their future will again seem very bright indeed.

Overall, the airline safety record domestically during the year, as shown in the following table, was better than in 1945.

Year	Fatalities per 100,000,000 Passenger Miles Flown	Passenger Deaths	Crew Deaths	Total Deaths
1945.....	2.1	76	14	90
1946.....	1.2	73	24	97

**Non-scheduled Operations.** The Civil Aeronautics Act of 1938 granted the Civil Aeronautics Authority (which was succeeded by the CAB) comprehensive economic control over commercial flying in the United States except for control over security issues which was withheld. In practice, the CAB exercised that control over the airlines that it certificated and that operated on regular, posted schedules. At the time when the Act became law, non-scheduled, non-certificated flying was very small in extent and was exempted from economic control in section 292.1 of the CAB's economic regulations.

The end of the war resulted in a surplus of trained pilots and transport aircraft. Due to the CAB's wartime moratorium on new route certifications, and because the certificated, scheduled carriers could not handle all the traffic available, 1945 saw the beginning of a tremendous growth of non-certificated, non-scheduled airlines which, operat-

ing under the exemption, offered to carry passengers and cargo anywhere in the country and even to foreign places. By the beginning of 1946, this activity was starting to rival in scope certificated, scheduled airline operations. A natural development was that some of the non-scheduled lines began operating only over certain routes, rather than holding themselves available for flights to any place. In order to systematize even further, some of the lines next began operating a certain number of flights daily or weekly to certain places. This provided not only a safer, but a more economic operation. But it also aroused a question as to whether these "non-scheduled" lines could any longer qualify for exemption under section 292.1.

The CAB even during the war had begun to consider the entire matter of non-scheduled operations, being fully aware that this traffic would grow rapidly after the war. It undertook a sweeping investigation of the field and in 1945 held hearings on both the safety and economic aspects of non-scheduled activities. It was, therefore, ready for the developments that were manifested in 1946. In the Spring, it issued two historic decisions on the question. They found two non-scheduled carriers in violation of the Civil Aeronautics Act because they were known to the public to be operating scheduled airlines over certain routes.

The CAB proposed a revision of section 292.1, promulgated safety regulations (Part 42 of the Civil Air Regulations) for non-scheduled carriers and required all such airlines to register with the CAB, file operating and traffic data at certain intervals and obtain certificates of operation from the CAA. This action gave the first adequate idea of the volume of these operations. In advance of the effective date of the filing of statistics, CAA obtained from its regional offices a survey to determine the extent of non-scheduled operations. In June, according to this CAA poll, there were 2,370 non-scheduled airlines, operating 5,529 aircraft. This compared to a bare two dozen scheduled carriers flying less than 1,000 planes. Route mileage of the non-scheduled lines was impossible even to estimate.

By September 1, approximately 500 non-scheduled lines had filed operating data with the CAB, 35 of which limited their activities exclusively to cargo. Despite this filing of information, general statistics still are sketchy. However, an analysis of the May and June operations of 252 non-scheduled lines emphasizing passenger traffic showed they carried only 1.6 percent of the passengers, and flew only 1.8 percent of the passenger miles recorded by certificated carriers.

The non-scheduled activity reached its zenith in 1946 and all indications by the end of the year were that it would be drastically curtailed in the future. For one thing, economic laws were operating against the non-scheduled lines as the CAB certificated new routes and these were put into operation by companies having stronger financial resources than most of the non-scheduled lines could acquire. Secondly, the CAB in December proposed further revision of section 292.1 which would rule passenger service on the part of non-certificated lines, which in fact, operate a scheduled service, requiring them to obtain an airline certificate of convenience and necessity of regular operation is to be conducted. Thirdly, in the same proposal, CAB set the non-certificated scheduled cargo common carriers apart, indicating that possibly certificates for this special service may be granted. Pending action upon applications for cargo service, these cargo operators may continue in a regularly

scheduled cargo business. In this new approach to the problem, the CAB dropped the term "non-scheduled carrier," replacing it with the words "irregular carrier."

It had long been assumed that the non-scheduled carrying of passengers would diminish in volume and importance as the CAB decided its local service route cases and enlarged the systems of the trunk carriers, so that the greatest significance of the CAB's December proposal lay perhaps in its proposals regarding air cargo operations.

Prior to the war, scheduled airlines did little in the cargo field. They had no planes especially equipped for the job, their passenger and mail revenue was reasonably high, air cargo rates were too high to be competitive with surface shipments. Following the war, the availability of surplus military cargo aircraft and military pilots, combined with the scheduled lines' inability to meet all demands for passenger air travel, created the most favorable conditions for non-scheduled cargo operations and this activity mushroomed. Intensive study by a number of organizations during the war had delineated certain broad types of commodities which showed promise of being transportable by air at reasonable rates. These included perishable fresh fruits and vegetables, high-value, low weight items such as jewelry, items perishable because of a time element, such as newspapers and periodicals, or high style wearing apparel. Some articles, such as dresses, also indicated air cargo potentials because of a saving in time and money on packing. Dresses can be hung on bars in the plane.

The result was that non-scheduled operators, using planes which needed little conversion, moved right into a field that was ready and waiting to be developed. One all-cargo non-scheduled line, Slick Airways, flew a million miles in only three months. Slick, National Skyways Freight Corporation, and U.S. Airlines, were capitalized at a total of \$10,000,000 and the three flew a total of 2,000,000 freight ton miles in the month of May, 1946. In contrast all the domestic scheduled carriers flew 5,556,896 express ton miles in the entire first quarter of 1946. By summer, the scheduled carriers were making efforts to protect their position in regard to freight. By August, there were eleven scheduled carriers in the cargo field, while in September, 1945, there had been only three. Even so, the nonscheduled operators had a substantial lead. In June, 1946, the scheduled carriers were flying 800,000 freight ton miles a month. But the non-scheduled lines were approximating 4,000,000 ton miles monthly.

All this could have but one result. By the end of the year, the scheduled, certificated airlines were making intensive effort to capture the cargo field. One, American Airlines, set up a Contract Air Cargo Division which was flying anywhere, under the contract with shippers. Another, and possibly the most important result of the non-scheduled activity was that rates began dropping. By late in the year, when the CAB began hearings on applications for all-cargo routes, rates ranged from 12 to 25 cents per ton mile, while before the war they had been from 70 cents up.

**U.S. Commercial Plane Types.** The backbone of the U.S. civil transport fleet during 1946 were the planes that made such a record during the war, the *Douglas DC-3* and *DC-4*, plus the *Lockheed Constellation*, all of which have been described in previous volumes of the Year Book. No plane of new design was put into passenger service during the year, although several *Douglas DC-6*'s—a larger version of the *DC-4* carrying fifty-two pas-

sengers—were turned over to two airlines for crew training preliminary to large-scale deliveries of the plane expected in 1947. There were however, several all-new planes that made their initial test flights during the year, the most important of which probably is the *Martin Model 2-0-2* which flew in mid-December. With deliveries to airlines expected to begin in January, 1947, this plane probably will be the first truly postwar transport to see service. This aircraft was described in the *YEAR BOOK* for 1946.

The Northrop Aircraft Corporation's *Pioneer*, one of the few planes designed specifically for cargo, also made its first test flight in the middle of December. This is an unconventional plane inasmuch as it is powered by three engines, a design last used in America more than ten years ago. It is an all-metal, full-cantilever high-wing monoplane powered by three Wright 744C7BA1 engines rated at 800 h.p. for take-off. Its gross weight is 25,000 lb. and useful load is 10,800 lb. As a passenger plane it carries 30 to 33. Span is 85 feet, length 60 ft., 7 in. and fuselage diameter 10 feet. It was designed especially for undeveloped parts of the world with primitive landing fields and consequently has two-wheeled, fixed landing gear with a tail wheel, rather than the retractable tricycle gear being used on most other new planes. Its specifications call for unusually short take-off and landing runs. Take-off with a full load is set at 700 ft., and landing at 750 feet. At 10,000 ft. altitude, its cruising speed is 185 m.p.h. and its range is 1,750 miles. Service ceiling is 21,000 feet. This promises to be a pioneer in new economies in operations. Another new plane which flew during the year, but merely as a working model for a later version was the *Consolidated Vultee Model 110* which will be succeeded by the *Model 240*. The *Convair 240*, which was near the test stage at year end, will carry 40 passengers and be powered by two Pratt and Whitney R-2800, 2,400 h.p. engines turning three-bladed reversible-pitch propellers. An all-metal, low-wing monoplane, the *Convair 240* has a span of 91 ft., 9 in., and a length of 73 ft. 4 inches. It has a pressurized cabin. Landing gear is the tricycle type with dual, co-rotating nose wheels. Cruising speed is set at 300 m.p.h., using special exhaust stacks on the engines to take advantage of the jet thrust given by the exhaust. Beech Aircraft Corp. expects to have ready in the Spring of 1947 a new feederline transport, the *Model 34*, which will be powered by four 350 h.p. Lycoming engines driving two propellers. Two engines in tandem will be installed in each nacelle which will be encased completely within the wing. The *Model 34* is an all-metal, high-wing monoplane with a "butterfly" tail which consists of two stabilizers fitted in a V-shape and no vertical rudder or fin. Carrying 22 passengers, the *Model 34* will cruise at 182 m.p.h. at 4,000 feet. It is designed to take off in 1,980 ft. and land in 2,100 feet. There were two other planes originally planned during the year for feederline use, but production plans for both had been dropped by the end of the year. These were the *Lockheed Saturn*, 14-passenger, two engine high-wing monoplane, and the *Boeing Model 417*, 20-passenger two-engine high-wing monoplane. Boeing's plans for production were officially classed as suspended, not discarded. The only other new plane announced during the year was the Curtiss-Wright Corp.'s *CW-32*, an all-cargo plane which is not expected to be test flown until 1948. It is designed for a gross weight of 80,000 lb. and will carry 25,000 lb. for 1,500 mi., or 20,000 lb. for 2,500 miles.

It is a high-wing monoplane, powered by four Wright R-1820 engine of 1,525 h.p. each, driving reversible-pitch propellers. Cruising speed is 270 m.p.h. at 25,000 feet. Cargo compartment contains 4,000 cu. ft. in one compartment that is 59 ft. long, 9 ft. wide and from 7 to 9 ft. high.

**Foreign Commercial Plane Types.** Notable advances in returning to peacetime construction of commercial aircraft were made in Europe principally by England, France and Sweden. The British, with an annual aircraft export goal of approximately \$64,000,000 were making the greatest efforts. Perhaps the most important plane to come from a British factory in 1946 was the *Bristol Freighter*, an all-cargo plane (although a passenger version is also being made). This is a high-wing monoplane, with fixed undercarriage and a nose section which swings open to provide access to the large cargo compartment. It is powered by two Bristol Hercules engines of 1,795 h.p. each. With a gross weight of 37,000 lb., it has a payload of 10,749 lb. It has a span of 98 ft. and length of 68 ft., 4 inches. Cruising speed is 153 miles per hour. Although its range at full load is short, 200-500 mi., it flew the Atlantic and undertook an extensive demonstration tour of North and South America. Another outstanding British aircraft that flew during the year was the *de Havilland Dove*, the successor to the tremendously successful prewar bi-plane *Dragon Rapide*. The *Dove* is an eight passenger low-wing, two-engine plane with retractable, tricycle landing gear. It is powered by Gipsy Queen 70 engines of 330 h.p. each, and has a speed of 200 m.p.h. and range of 500 miles. Span is 57 ft., and length 39 ft. 4 inches. Showing promise of being one of Britain's best commercial types is the *Handley-Page Hermes* series, *Mark I* of which is flying. This is a low-wing monoplane with single fin and rudder and powered by four Bristol Hercules 101 engines developing 1,800 h.p. each. The *Hermes I* has two-wheel retractable landing gear, but the *Hermes IV* will have tricycle retractable gear, and the *Hermes V* will have the same gear and Bristol Theseus turbine-propeller engines instead of reciprocating engines. Various passenger capacities are planned, ranging from 34 to 63. The *Hermes* has a span of 113 ft. and length of 82 ft., 2 inches. The *Hermes I* has a speed of 203 m.p.h., while the turbine-propeller version will have a speed of 297 m.p.h. Range varies from 1,200 mi. to 2,000 mi. in the several versions. Another British plane attracting a great deal of notice is the *Miles Marathon*, a high-wing monoplane with twin fins and rudders and tricycle, retractable undercarriage. The *Marathon* follows the British trend of four engines for even small planes, being powered by four de Havilland Gipsy Queen 71 engines of 330 h.p. each. It carries 18 passengers at a speed of 175 m.p.h. for a range of 500 miles. Span is 65 ft. and length 52 ft. 1 inch. There is also a turbine-propeller version of the *Marathon* being planned, to be known as the *M. 69*.

The British industry during 1946 had several notable phases. Most important, perhaps, was the decision made in the Spring to concentrate on the development of gas turbine engines with the objective of having all British aircraft—military and commercial—powered by jet or propeller-jet engines within five years. Primary reason for this was that the British feel that the reciprocating engine, particularly in the United States, has reached its ultimate development and that rather than attempt to produce reciprocating engines equal to those of the United States it is better to develop the type of engine which eventually will

succeed the piston engine. Corollary to this reasoning is that the British admit they do not have the personnel nor facilities to develop both types simultaneously, the method being pursued in the United States. Accordingly, the British were farther advanced in jet engines in 1946 than was the United States. By the end of the year they had flying what was termed a jet transport. In reality, this was a Lancaster four-engine bomber converted into a Lancastrian transport and powered by two piston engines and two Rolls-Royce Nene jet engines, each jet unit developing about 3,000 lb. static thrust. It flew at close to 800 m.p.h. on the jet engines alone. The British claimed equality with the United States—as far as quality was concerned—in light and medium transport types and in cargo planes. They acknowledged, however, a definite inferiority to the United States in four-engined transports. The main reason for this dated back to the war. During the war the British industry concentrated on the production of fighter and bomber aircraft. The United States industry alone continued with the production of transports for war purposes. At the end of November, the British aircraft and engine industry had orders on hand aggregating \$222,959,750, of which \$201,500,000 constituted orders from the military and naval air arms and national airlines.

**French Commercial Types.** The French aircraft industry, perhaps Europe's greatest, from a civil standpoint, before the war, suffered more grievously than that of any other nation, with many of its factories destroyed and little, if any, opportunity or incentive for planning postwar types. During 1946 it made a remarkable comeback and late in the year had a score of commercial types in various stages of planning or production. In general, these followed the design of proven U.S. types, but were under-powered by U.S. standards and consequently, below the U.S. mark in performance. Apparently the most promising French transport is the *Languedoc*, otherwise known as the SE-161, made by the southeastern factory of the nationalized aircraft industry. This plane is in production and the first several of twenty-five on order have been delivered to Air France, the national airline. Maximum passenger capacity is thirty-three. It is a low-wing monoplane powered by four Gnome-Rhone engines of 1,090 h.p. each. Cruising speed is 230 miles per hour. Span is 115 ft. and length is 94 feet. It has twin rudders and conventional retractable landing gear. Another plane that is in production is the NC 702, a combination passenger-cargo aircraft designed for operation off small fields in sparsely-settled countries. This is a two-engine, low-wing monoplane powered by 490 h.p. Renault engines. Cruising speed is 202 miles per hour. It is based on German designs. Planned by this same factory is a huge, high-wing monoplane designed to carry from 131 to 150 passengers. As a combination passenger-cargo plane, it could carry 32,600 lb. and seven passengers. It is to be powered by four 1,570 h.p. engines. Span is 144 ft., 6 in., and length 100 feet. Cruising speed is 199 miles per hour. The Southeast factory has under construction the SE-2010, a 60-108 passenger transport to be powered initially by four U.S.-made Pratt & Whitney Wasp Major engines each of 3,500 horse power. A low-wing monoplane, it has retractable, tricycle landing gear. Span is 161 ft. and length is 130 feet. Maximum gross weight is 154,500 lb. The cruising speed is 286 m.p.h. with a top speed of 354 miles per hour. Another plane in the *Languedoc* class that is flying is the SO 30R, a mid-wing monoplane with a ca-

capacity of 30 passengers and 4,300 lb. of freight at a range of 620 miles. Alternative arrangements can give a range of 2,110 miles. It is powered by two-Gnome-Rhone 14R 33 engines each developing 1,730 horse power. Span is 84 ft., and length is 60 ft., 6 inches. Cruising speed is 255 m.p.h. with a maximum speed of 342 miles per hour.

Sweden's aircraft industry during the year produced only one transport type aircraft, but that one was extremely interesting coming from an industry that had not been prominent in transport manufacturing. The airplane is the *Scandia*, made by Svenska Aeroplan A.B. In configuration it resembles the American DC-3, but it contains some advanced engineering features and indicates very high performance. It is a low-wing monoplane with tricycle, retractable landing gear and single tail fin. It carries 24 or 32 passengers from 715 to 960 mi. at a cruising speed of 220 miles per hour. It is powered by two Pratt & Whitney R-2000-13 engines each of 1,450 take-off power. Span is 91 ft., 8 in. and length 69 ft., 4 inches. The *Scandia* flew for the first time in November and was reported to have met all specifications. It was designed to meet requirements laid down by the U.S. Civil Aeronautics Board, and to conform to recommendations of the Air Transport Association, the trade association of the U.S. airlines.

**The Aircraft Manufacturing Industry.** Overall, the United States aircraft manufacturing industry (including manufacturers of engines, propellers, accessories and parts) in 1946 achieved a much better production record than had been expected. The first six months of the year were practically non-productive. The industry had a more difficult reconversion problem than any other with the possible exception of shipbuilding. From the world's greatest industry (in 1944), it shrunk to one-fourth that size by the end of 1945 and was still being contracted as 1946 opened. The first six months of the year was a readjustment period; settling terminated war contracts, tooling up for civilian models, arranging for permanent production facilities (about 90 percent of war-built plants were owned by the Government), adjusting administrative, engineering and production staffs to peacetime requirements, and establishing sources of supply in non-priority market. While most aircraft companies were not directly affected by the wave of strikes that swept the country in the first four months of 1946, they suffered as much because the strikes cut off supplies. One of the gravest shortages, that persisted for most of the year, was in aluminum. For this item, the aircraft industry was bidding against general industry and in particular against the home-building industry which had full Government backing. Aluminum production was not adequate to meet all demands in any event, and when the aluminum industry was affected both directly and indirectly by strikes, airplane builders were far down on the list to receive deliveries for many months. Another critical shortage was in fabric, caused not so much by strikes as by price ceiling difficulties and an unprecedented demand for clothing. This shortage of fabric affected the manufacturers of personal-type aircraft who were expected to lead the aircraft production parade.

As a tide-over measure, airplane builders accepted subcontracts for nearly every kind of item, or went into prime production of many items far afield from aircraft. Among products manufactured by the industry in 1946 were small boats, soft drink vending machines, metal burial caskets, industrial jacks, plastics, motor scooters, automotive equipment and washing machines. Several manu-

facturers experimented with pre-fabricated housing, but little came of it.

By mid-year the industry was practically retooled, the plant situation being straightened out, and production began to creep toward record peacetime heights. However, the industry already was giving evidence that during 1946, at least, its profits would derive chiefly from refunds on excess profits taxes paid during the war years. That item dominated the financial reports of the aircraft companies throughout the year. Only one major company in 1946 made a profit before allowing for excess profits tax refunds and carry-back credits. As of June 30, 1946, total current assets of the 21 major aircraft and aircraft equipment companies were \$975,000,000, and current liabilities \$420,000,000 for a net working capital of \$555,000,000. While this was an all-time high, even exceeding the working capital of the peak war year of 1944, and some \$9,000,000 above the previous record figure (1945) of \$546,000,000, this did not give a true picture of the industry's financial position. The weak spot was the extremely high inventory figure of \$273,000,000, which was 28 percent of all current assets. This was a higher ratio than generally pertained in wartime when the industry had an ever-expanding market and assurance of sales and final payment. This high rate of inventories, while not peculiar to the aircraft industry during the year, was a source of considerable worry and actual financial hardship for several companies which passed into receivership during the year despite having substantial orders on their books. They over-extended themselves in acquiring material and in retaining large working forces to push work to near-completion only to find too late that lack of parts prevented deliveries and, consequently, payment for their expenditure.

The progress of the industry throughout the year is shown by the production figures. In January, total production was 1,321 planes, valued at \$21,368,326, of which 94 planes were for the Army or Navy. In June, monthly production was up to 3,489, with a value of \$32,440,370. In this month, military and naval production was very low, a total of 60 planes, which reflected chiefly, the shortage of aluminum and of jet engines (due to strikes) for Army *Lockheed P-80* fighters which had the largest procurement schedule at that time. The full year's production, with the months of November and December estimated, was expected to be 36,580 aircraft, valued at approximately \$367,000,000. Of this volume, 1,400 were military and naval planes, 450 transport planes, and 35,000 personal-type aircraft. Including engines, propellers, parts, accessories and military and naval research and development work, total income for the aircraft industry in 1946 was approximately \$1,000,000,000. This compares with a 1945 gross revenue of about \$10,000,000,000 but a prewar (1939) income of \$280,000,000. Employment in the industry in December, 1946, was slightly more than 161,000, a substantial increase since the start of the year, but far below the wartime peak of more than 2,000,000. The industry's backlog of orders on hand on June 30 was 51,270 aircraft valued at \$1,054,927,503, of which 47,657 planes valued at \$411,542,031 were civilian. By October, this backlog was 40,862 planes valued at \$1,146,061,106 and was expected to remain fairly close to those figures for the remainder of the year. In October, the civilian backlog was 37,883 planes valued at \$465,013,114. The contrast between the June and October figures is a further reflection of the industry's development during the year. While the number of

planes on order declined, the value of them increased. There were three main reasons for this: one, the letting of military contracts for bombers—small quantity, but high value; two, increased orders for transport planes; three, a great decline in orders on hand for personal type aircraft combined with increasing sales of three-and four-place personal aircraft rather than two-place which had constituted most of the backlog in the summer. As was true with most other consumer items, personal plane orders contained many duplications. As production increased, these duplications were weeded out. In the last quarter of the year, personal plane deliveries slumped somewhat due to three factors: first, the production of two-place planes for use in training under the Servicemen's Readjustment Act (see below) began to catch up with the demand; second, a seasonal slump in the purchase of planes in the northern states where winter provides poor flying weather; third, a decrease in production of two-place planes as manufacturers prepared for volume production of the larger three- and four-place aircraft.

While the actual figure is restricted for reasons of military security, it is estimated that during 1946 the industry had research and development contracts from the Army and Navy totaling about \$400,000,000. This, combined with military and naval purchases of aircraft and parts, indicates the level of production based upon government contracts.

In 1947, it is expected that deliveries of commercial transports will greatly increase. How much national defense expenditures will be decreased, and how this will affect the aircraft industry is problematical. But both the Army and the Navy are planning expanded research programs and in addition are undertaking a joint program of industrial preparedness which will result in the placing of contracts aggregating approximately \$70,000,000 with the aircraft industry alone.

The industrial preparedness program is being formulated to apply to all industries, but inasmuch as the aircraft industry was the largest during the past war, it is being used as the laboratory for the plans. In charge of this program is the Army-Navy Munitions Board which during 1946 was headed by Richard R. Deupree. The purpose of the program is to make possible in an emergency very rapid expansion of aircraft production facilities for the most modern types of planes and equipment. It is based on the fact that both before and during the war the average time from design of an airplane to peak production was about three years. The aircraft industry attained peak production in 1944, nearly three years after the United States went to war, and that was on production of planes that had been designed before December 7, 1941. The Army, Navy and the aircraft industry are convinced that should war come again the United States will not be given that much time to prepare. Under the industrial preparedness program, twenty-two aircraft manufacturers in 1946 were given small contracts to submit ideas on production planning to the services. When these ideas have been studied, further contracts will be let for the implementation of the most likely proposals. The general outline of the industrial preparedness program as it developed in 1946 is that a small number of plane types will be selected as those which would be most efficient in any war that should occur within the span of a few years. Next, a small procurement order will be placed for those planes. In addition, out of the industrial preparedness appropriation will come money for the manufacturer

to use in formulating plans for mass production of those planes: drawings, assurance of sources of supply, plans for sub-contractors, etc. A pilot line of mass production special tools would also be financed. This industrial preparedness plan will be revised as often as deemed necessary, perhaps every year. It could mean a complete change of plans annually, so that the \$70,000,000 which is being asked for the program for the fiscal year beginning July 1, 1947, could constitute merely the beginning of a much larger annual expenditure in the aircraft industry.

**Army and Navy Aviation.** The stress laid on industrial preparedness by the Army and Navy during 1946 highlighted the over-all emphasis on research and development. Procurement schedules called for delivery of approximately 1,600 aircraft of all types during the year. Even this modest program (as measured against the Air Coordinating Committee's recommendations for the annual purchase of a minimum of 3,000 new planes) was not met, with deliveries approximating 1,400 aircraft.

The drop in procurement was part of a general trimming down of service aviation from a war to a peace basis. Gen. Carl Spaatz succeeded Gen. H. H. Arnold as commanding general of the Army Air Force. In March, the Army Air Forces announced that its peacetime force would be approximately 400,000 men, in 70 groups, and disclosed a command structure comprising three major commands: the Strategic Air Force, headed by Gen. George C. Kenney; Tactical Air Command, Lt. Gen. Elwood R. Quesada; Air Defense Command, Lt. Gen. George E. Stratemeyer. The Air Transport Command during the year was greatly reduced in the extent of route miles operated.

The appropriation for the Army Air Forces for fiscal 1947, which began July 1, 1946 was \$1,199,500,000, and for the Bureau of Aeronautics of the Navy was \$805,760,000. Of these amounts, the AAF could use \$401,900,000 for the procurement of new aircraft, and the Navy \$310,800,000. In addition, research appropriations for the two services were: Air Forces \$184,200,000; Bureau of Aeronautics, \$100,600,000.

With military and civilian personnel being cut in both the Army and Navy air arms, the only expansion was in research and development, particularly in the fields of jet and other new propulsive devices for aircraft, and guided missiles. To coordinate this research to avoid duplication and make the best possible use of research facilities and personnel, there was established the Joint Research and Development Board, chairmanned by Dr. Vannevar Bush (wartime head of the Office of Scientific Research and Development), and consisting of Army and Navy representatives, and responsible to the Secretaries of War and Navy. The chief need for coordination was in the realm of guided missiles. The Navy had its own program, coordinated within the department by the various bureaus, and the War Department also had a separate program undertaken at first by the Ordnance Department and with the Army Air Forces doing similar work. This situation was finally resolved by a directive making the Air Force primarily responsible for guided missiles, with other branches of the Army to continue their work under AAF supervision.

The actual state of the development of guided missiles in 1946, from a performance standpoint, was a carefully guarded secret. However, there were several very strong indications that great strides have been made. One was the announcement by the Navy that a radar-directed gliding

bomb (the "Bat") was being put into operational service. This was a wartime development and was used sparingly against the Japanese. While acknowledged as rudimentary, it is now a standard Navy weapon in order to familiarize naval personnel with guided missiles. In appearance resembling a small airplane, the "Bat" is 12 ft. long with a 10 ft. span. It carries one 1,000 lb. bomb and although having no propulsive machinery can attain a speed of about 320 m.p.h. in its glide. It can be launched from 10,000 ft. altitude nine miles from the target. It is carried under the fuselage of a fighter plane or under the wing of a bomber and its radar, in the nose of the "Bat," piped into the mother plane. An operator in the mother plane fixes the "Bat's" radar on the target before launching the weapon. It will follow the target through any evasive maneuver.

The establishment by the Army Air Forces of the First Guided Missile Experimental Group, in January, 1946, furnished another indication of the advance made in guided missiles. This group, normally based at Eglin Field, Florida, participated in the revealing tactics during the atom bomb tests at Bikini where pilotless Navy planes carried photographic equipment and other recording apparatus over the target to record effects of the blasts. It also conducted a flight of two pilotless B-17 bombers from Hawaii 2,400 miles to the Army Air Base at Muroc, California. Operators in mother planes, flying from 200 ft. to three miles away from the "drones," controlled the planes through remote control radio.

Throughout the year, the Army and Navy cooperated in the test firing at White Sands, New Mexico, of German V-2 rocket-powered bombs, the parts of which had been captured and re-assembled in this country. One of these rockets attained a new altitude record of 104 miles. These experiments were to test new fuels for rocket engines, control devices for guided missiles and to explore the upper atmosphere. To obtain information on this latter aspect, the head of the V-2's used were filled with delicate recording instruments which by radio impulses transmitted the information to devices on the ground. The operation of this system, known as "telemetering," was one of the Navy's principal tasks at White Sands.

Despite the solid accomplishments during the year in the field of guided missiles and pilotless aircraft, perhaps the most significant event in military aviation in the year—if not the most significant in the entire sphere of aeronautics,—concerned a piloted aircraft: the first flight on December 9 of the XS-1, powered by a rocket engine. The XS-1 was designed as a research plane at supersonic (faster than sound) speeds, and was built by the Bell Aircraft Corp., of Niagara Falls, New York, for the National Advisory Committee for Aeronautics at the behest of the Army Air Forces which furnished the funds and which will take over the aircraft when it has completed tests for Bell and the NACA. It was designed to achieve a speed of 1,700 m.p.h. at an altitude of about 80,000 feet. In its initial flight, the plane was launched in mid-air from an especially-equipped B-29 bomber and Bell test pilot Chalmers Goodlin deliberately held down the speed to about 550 m.p.h., remaining aloft for approximately 19 minutes during which time he alternated between gliding and powered flight and used full power of the rocket engine for barely one second. Testing is scheduled to proceed gradually so that it will perhaps be the summer of 1947 before a deliberate attempt is made to exceed the speed of sound.

The XS-1 resembles a very small conventional fighter in some respects. It has a wing span of 28 ft. and a length of 31 feet. It is a mid-wing monoplane with extremely thin wings slightly tapered to square wing tips. The fuselage is roughly cigar-shaped with the cockpit contained completely within the fuselage, and the cockpit windows shaped so that there is no break in the smooth surface of the fuselage from nose to tail. Designed to withstand a force 18 times the pull of gravity, the wings are formed of skin machined from solid aluminum stock to one-half inch thickness at the roots and one-eighth inch thickness at the tips. The empty weight of the XS-1 is 4,892 lb. and the gross load for its first flight was slightly more than 13,000 lb. The wing loading is approximately 100 lb. per square foot.

The XS-1 is powered by a rocket engine containing four combustion chambers each developing 1,500 pounds of thrust. The pilot throttles the plane by turning on or off these combustion chambers or cylinders so that he can increase or decrease power only in units of 1,500 pounds of thrust. At full power, the engine develops 6,000 pounds of thrust. This engine was developed by Reaction Motors, Inc., Dover, Delaware, for the Bureau of Aeronautics of the Navy Department and was furnished to Bell at the request of the Air Forces. For its power it is probably one of the most compact engines ever built. It is contained completely within the tail end of the fuselage, and is 56 in. long, with a diameter of 19 in. and a dry weight of 210 lb. The engine, designated by the Navy as 6000C4 uses liquid oxygen and alcohol as fuel. This is forced into the cylinders under pressure supplied by tanks of compressed nitrogen or helium. This system increases the weight the plane must carry because of the weight of these tanks, and of the fuel tanks which also must resist great pressure. Future rocket planes likely will have a fuel system whereby pressure is obtained by use of a turbo-compressor, thus reducing weight. The fuel in the combustion chambers of the 6000C4 engine is ignited by the explosion of a smaller rocket which is fired by means of a spark plug. After this, firing is spontaneous.

While the XS-1 was pointing the way toward an entirely new type of aircraft, the Army and Navy continued development of both reciprocating and jet engine planes. One unofficial tabulation in November, 1946, listed 50 types of aircraft on order from 22 manufacturers. During the year, the two services announced details on about 30 new aircraft. Most important of these were:

McDonnell Aircraft Corp. *FD-1 Phantom*: Navy carrier-based fighter powered by two Westinghouse 19XB axial-flow jet engines placed in the wing roots. Each is rated at 1,360 lb. thrust. Span is 40 ft. and the wings fold for storage aboard ship. Length is 37 ft., 2 inches. Service ceiling is over seven miles, range is 1,000 mi. and speed is in excess of 500 miles per hour. The gross weight is slightly under 10,000 lb.

The Glenn L. Martin Co. *AM-1 Mauler*: Single engine Navy dive or torpedo bomber powered by Pratt & Whitney Wasp Major engine developing 3,000 h.p. turning a Curtiss Electric four-bladed propeller. Span, 50 ft., length 41 ft., 8 inches. Gross weight is 19,500 lb. It can carry 4,000 lb. of bombs or rockets and is armed with four 20 mm. cannon. It has a speed in excess of 350 m.p.h. and a range of more than 1,700 miles.

Douglas Aircraft Co. *AD-1 Skyraider*: This is the same class of plane as the *AM-1*, a new type for the Navy which supplants the former *BT* type. It is also a dive or torpedo bomber which can carry 6,000 lb. of bombs or rockets, torpedoes or mines. It carries five-inch rockets and has additional armament of 20 mm. cannon. It employs a new type of dive brakes which extend like fingers from the underside of the fuselage.

Consolidated Vultee Aircraft Corp. *XP-81*: Experimental Army fighter powered by one General Electric-Alison TG-180 jet engine and one General Electric TG-100

propeller-turbine engine. Span, 50 ft., 6 in.; length 44 ft., 8 in.; height, 18 ft., 6 inches. This is the first announced use in an aircraft in this country of the propeller-turbine type of power plant in which the turbine of a jet engine turns the propeller shaft. The *XP-81* has the propeller-turbine engine in the nose with the air intake around the propeller hub. The orthodox jet engine is mounted in the fuselage aft of the cockpit with the air intake achieved through scoops atop the fuselage behind the cockpit. The jet nozzle is in the tail of the aircraft under the tail assembly. Speed of this plane is more than 500 m.p.h. Gross weight is 19,500 lb.

Northrop Aircraft Inc. *XB-35 Flying Wing*: One of the most radical types of aircraft ever built and successfully flown, this is a tailless bomber for the Army Air Forces, with a gross weight of 162,000 lb. and powered by four Pratt & Whitney Wasp Major engines each rated at about 3,500 h.p. driving four eight-bladed contra-rotating Hamilton Standard pusher propellers with a diameter of 15 ft., 4 inches. The center section of the wing is 53 ft., 1 in. wide and the wing has an area of 4,000 sq. feet. This aircraft has no tail surfaces; controls, in addition to the ailerons, consist of "elevons," at the wing tips which fulfill much of the same purpose as rudders and elevators. Cockpit and accommodations for the crew of 15, as well as the engines, are all contained in the mammoth wing. The plane has tricycle, retractable landing gear. It was designed for a range of 10,000 mi. and bombload of 10,000 lb. Its empty weight is 89,000 lb. and maximum overload gross weight is 209,000 lb. The plane made its first flight in May, 1946, and was still undergoing its acceptance tests in December. Meanwhile, the AAF had contracted for 14 other Flying Wings. Northrop is also at work on a jet-powered version, designated the *XB-49*.

Douglas Aircraft Co. *XB-43*: This was the first jet-propelled bombing plane built. It is similar to the *XB-42 "Mistmaster"* bomber which is powered by two liquid-cooled reciprocating engines buried in the fuselage and driving contra-rotating propellers at the tail. The *XB-43* is powered by two TG-180 jet engines each developing about 4,000 lb. thrust. It has a span of 71 ft., 2 in., length of 51 ft., 8 in., speed in excess of 500 m.p.h., and range of 1,400 miles.

Boeing Aircraft Co. *B-50*: This is a development of the famous *B-29 Superfortress* Army bomber. It has the same dimensions as the *B-29* but is powered by four Pratt & Whitney Wasp Major engines of 3,500 h.p. each in contrast to the 2,200 h.p. Wright engines of the *B-29*. Its speed is 425 m.p.h., as against the 360 m.p.h. speed of the *B-29*. The increased power and engineering changes have added 20,000 lb. to the 120,000 lb. gross weight of the *B-29*.

Chance Vought Aircraft division of United Aircraft Corp. *XP-57-1*: This ranks with the *XS-1* and *XB-35* as an outstanding design and engineering achievement. It is an experimental Navy fighter plane with a nearly round all-wing configuration and twin rudders at the rear perimeter. It is powered by two Pratt & Whitney Twin Wasp engines of 1,350 h.p. each. These engines are buried in the wing and through transmission gears drive special, four-bladed propellers placed on the outer extremities of the wing. The most startling feature of the *XP-57-1* is that it can hover in vertical position on its propellers, a performance never before achieved with a fixed-wing aircraft. It is designed for speeds ranging up to 550 m.p.h., depending on the engine installation. The *XP-57-1* was scheduled to make its test flight in September, 1946, but the date has been postponed probably until the spring of 1947. Its performance characteristics were proven in 1942 by the *V-173*, an aircraft of the same configuration but with low-powered engines.

Consolidated Vultee *XB-36*: The largest land-plane now flying, this is an Army bomber of which the AAF has ordered 100. It has a span of 280 ft., length of 163 ft., a tail fin 47 ft. high, and a gross weight of 278,000 pounds. It was designed to carry 10,000 lb. of bombs 10,000 miles. It is powered by six Pratt & Whitney Wasp Major engines of 3,500 h.p. each, driving Curtiss Electric 19 ft. three-bladed pusher propellers in the trailing edge of the wing. It carries a 15-man crew. It is a high-wing monoplane with the wing located about half-way between nose and tail. Top speed is set at about 330 miles per hour. The first flight of the *B-36* was made in the summer of 1946 and acceptance tests were to be completed in December.

Edo Aircraft Corp. *XOSE-1*: Navy seaplane for operation off cruisers and battleships for scouting or reconnaissance. A single-engine low-wing monoplane, it is powered by a 550 h.p. Ranger engine. It has a speed of more than 200 m.p.h. and a range of 1,000 miles.

Lockheed Aircraft Corp. *XE-40 Constitution*: The largest transport land plane now flying, this was designed as a Navy transport. Two planes have been built, the first of which made its test flight in November. The span is 189 ft., length is 156 ft., and gross weight is 184,000 lb. It can carry 180 passengers and has a range of 6,000 mi. and speed of 300 miles per hour. The *Constitution* is a mid-wing monoplane with a two-deck hull, and is powered by four Pratt & Whitney Wasp Major engines developing

8,500 h.p. each. While it is unknown whether there will be any immediate development of this plane as a commercial transport. It is built so that it can easily be converted to jet engines when such an engine of suitable power is built.

**Fairchild Engine & Airplane Corp. XNQ-1:** Navy primary trainer, the first primary trainer built since the end of the war and the first with retractable landing gear and controllable-pitch propeller. Of all-metal construction, it is a low-wing monoplane with two seats arranged in tandem under a bubble canopy, also a departure in planes of this type. It is powered by a nine-cylinder 820 h.p. Lycoming engine. Gross weight is 8,700 lb., span is 41 ft. 5 in., length is 27 ft., 11 inches. It has a top speed of 170 m.p.h. and climbs at 1,000 feet per minute. This is also the first airplane to contain the standardized cockpit arrangement of instruments which was worked out jointly by the Navy, Army and the British Royal Air Force for installation in every single-engine aircraft of the three services.

**North American Aviation, Inc. XFJ-1:** Navy jet-propelled fighter powered by a TG-180 engine. This is a low-wing monoplane with the air intake for the engine in the nose and a straight-through flow to the jet nozzle in the tail under the elevators. The horizontal tail surfaces have a 10 degree dihedral in order to get the surfaces out of the air shock wave from the wings. It has tricycle landing gear and droppable fuel tanks on the wing tips. Other than listing the speed as more than 500 m.p.h., the Navy has released no details on this airplane.

**Chance Vought XF6U-1 Pirate:** Navy jet-propelled fighter to succeed the famous *F4U Corsair*. This is a low-wing monoplane constructed of a new material originated by the manufacturer and designated "Metalite." It consists of two sheets of high-strength aluminum alloy with a balsa wood core. This is claimed to give a smoother, harder finish than usual aircraft metal, and to be stronger and less susceptible to skin wrinkles that sometimes occur in ordinary metal at high speeds. The Pirate is powered by a Westinghouse jet engine of new design and beyond stating its speed at better than 500 m.p.h., the Navy has released no performance or specification details.

**Martin XP4M-1:** Navy patrol bomber of high-wing design powered by two Wasp Major reciprocating engines and two General Electric Allison J-33 jet engines. The airplane has two engine nacelles, each containing one reciprocating engine and one jet engine. Only details that have been released are speed of 898 m.p.h., gross weight of 81,887 lb. and service ceiling of 16,400 feet.

**Consolidated Vultee L-13:** An Army liaison plane, the first aircraft of this type to be built since the end of the war. It is an all-metal high-wing monoplane that ordinarily carries three persons but can carry up to six. It has a span of 40 ft., 5 in., length of 31 ft., 9 in., and height of 9 ft., 5 inches. With a 245 h.p. Franklin engine, it has a cruising speed of 92 m.p.h., a top speed of 115 m.p.h., range of 368 mi., service ceiling of 15,000 ft., and gross weight of 2,900 lb. It has folding wings so as to simplify transportation and storage, and takes off in a run of only 230 ft., and lands at 43 m.p.h. in a distance of 227 feet.

**Republic Aviation Corp. XP-84 Thunderjet:** Army Air Forces jet fighter successor to the company's famous *P-47 Thunderbolt* fighter of the war. It is a low wing fighter of very clean lines, with the air intake in the nose and a straight-through flow to the jet nozzle in the tail. Powered by a General Electric Allison J-35 jet engine of approximately 4,000 lb. static thrust, it is perhaps the fastest airplane now flying for the AAF, unofficially being credited with 619 m.p.h. when stripped down and especially prepared for a record test run. Span of the *P-84* is 36 ft., 10 in., and length is 36 ft., 6 inches. Three experimental planes were ordered by the AAF, followed by a service test order of 25 *YP-84*'s, and finally an order for 100 production models.

**Private Flying.** Despite the tremendous expansion in air transport during 1946, and the notable achievements in research and military aircraft, many observers took most satisfaction from the development of private flying. This was completely discontinued during the war. The only training was of military and naval pilots; the only airport construction was for military purposes; private flying was forbidden for most of the war and when and where it was not, gasoline rationing effectively grounded personal aircraft. All during the war period, both government and private aeronautical agencies stated that after the war the greatest expansion in aviation would be in the field of private flying. The year 1946 gave some evidence to confirm that belief. During the year the Civil Aeronautics Administration licensed more than 100,000 pilots and nearly 50,000 aircraft. This brought the

number of pilots at the end of the year up to an estimated 400,000, and certificated aircraft to 85,000, compared with 296,895 pilots and 37,789 aircraft in 1945. In addition the CAA issued 170,000 student pilot certificates, more than double the number in 1945.

The great increase in certificated pilots could be attributed mainly to two reasons: the return to flying of pilots who dropped out during the war; and the obtaining of civilian licenses by members of the Army and Navy who learned to fly during the war. The real index of interest in flying, therefore, was the student pilot licenses issued. The tremendous jump in these was largely due to the amending in January, 1946 of the Servicemen's Readjustment Act, commonly known as the G. I. Bill of Rights, to make it possible for a veteran to learn to fly at government expense. It required several months for the Veterans Administration to promulgate its rules and regulations covering this training, but nevertheless by summer the flying schools of the country were jammed with veterans. It was estimated that total enrollment for all aviation courses, including mechanics, was more than 100,000.

Both training and the resumption of private flying was aided by the availability of surplus aircraft. In two years ending September, 1946, the War Assets Administration and its predecessor agencies in the disposal of surplus planes had sold 20,700 aircraft of the type suitable for private flying. The production of new personal planes was another factor responsible for the growth of this type of aviation during the year. In 1945, personal plane manufacturers turned out 2,047 planes; in 1946, production was estimated to be 35,000, a truly amazing increase. For most of the year, there were 29 manufacturers with 37 different models of strictly personal aircraft in production. Most of these, and most of the planes sold, were two-place monoplanes differing very little from prewar designs. About 90 percent of the two-place aircraft sold during the year went to schools to be used for training purposes. In October, this training school market began to weaken as operators' requirements were filled. Weather also began to curtail flying. Sales of personal aircraft, which actually were chiefly two-place aircraft, slumped badly in November. Dollar value did not decline in the same proportion, indicating that sales of three- and four-place aircraft were beginning to increase. This is the type of plane on which most manufacturers are planning to concentrate, and despite the high cost of such a plane (ranging from \$5,500 to nearly \$8,000), it is expected that 1947 sales will continue to increase.

To keep up with the boom in private flying, the CAB and CAA during the year drastically amended several regulations in order to simplify the obtaining of a flying license and title of an aircraft. Increased authority was given to the CAA regional offices, and private flying flight examiners were authorized to issue student pilot permits, rather than requiring that the student apply to a CAA office. The CAA was instrumental—with private aviation organizations—in pushing through to enactment by Congress the first Federal-aid Airport Act under which the Federal Government will share with states, municipalities, or other public agencies the cost of constructing new airfields or enlarging existing fields. The number of airports listed by the CAA during the year fluctuated around 4,000 and there has been general agreement for two years that the minimum number necessary to serve the country is 6,000. More than half of

these would be small fields suitable for use by private flyers. Under the terms of the act, the CAA is permitted to spend \$500,000,000 over a seven-year period. The initial appropriation for the fiscal year ending June 30, 1947, is for \$45,000,000, of which \$30,822,750 will be used for construction purposes within the continental limits of the United States. In January of 1947, CAA was to submit to the Congress a plan for using these funds and construction was expected to get underway in the Spring of 1947.

The passage of this act, in its potentials, at least, was one of the major aeronautical developments of the year. The only similar program in the field of transportation on which the Federal Government has ever embarked is the Federal-aid Highways grant which began in 1921. The successive highway acts are responsible for the network of roads in this country and widespread use of motor vehicles. The lack of sufficient number of airports has been considered a serious detriment to aviation expansion and the Federal-aid Airport Act largely can eliminate this impediment. Expenditures under it are not limited to private flying fields. Large cities can also obtain financial assistance from the Federal Government for the improvement or construction of airports.

**Helicopters.** The year 1946 saw the helicopter that was still in the experimental stage when war began, achieve commercial utilization for the first time. This vehicle is revolutionary as a form of transportation. It can ascend and descend vertically; hover in the air; proceed at any speed forward, backward, or sidewise up to its top speed; and can accordingly adjust itself to any traffic condition; is entirely free from the necessity of landing on conventional landing runways; and can land with power off in a very few feet of open space through the operation of the principle of autorotation. This principle means that when the power goes off the rotor it disengages automatically from the rotor and continues to rotate, thus affording support to the vehicle as it descends toward the ground. The Civil Aeronautics Board gave it a measure of recognition early in the year when it issued Part 06 of the Civil Air Regulations, which set up the standards of airworthiness of helicopters. Then in March the CAA issued the first commercial helicopter license in history, to Bell Aircraft Corporation's *Model 47*, a two-place rotorcraft. Later, Sikorsky Aircraft division of United Aircraft Corp. was issued a license for its *Model S-51*, a four-passenger helicopter. Bell and Sikorsky participated separately in a number of experiments to explore some of the many uses for the machine, and by the end of the year there was a growing volume of work such as crop-dusting, fire-spotting, utility line patrolling, being done by helicopter. In September, the world's first commercial helicopter service was formed in Philadelphia under the name of Helicopter Air Transport to render service by helicopter under contract in a variety of ways. The Post Office Department sponsored helicopter mail delivery tests at Los Angeles, New York, and Chicago. A CAB examiner recommended the issuance of a certificate for helicopter mail and passenger service in the area surrounding Cleveland, Ohio. By the end of the year, Bell alone had sold nearly \$1,000,000 worth of helicopters. Principal machines in use or planned during 1946 were:

**Bell Model 47:** Two-place helicopter powered by a Franklin 175 h.p. motor turning a two-bladed rotor with a diameter of 33 ft., 9 inches. It carries a useful load of 612 lb. and cruises at 80 m.p.h. with a range of 200 miles.

**Bell Model 48:** Five-place helicopter powered by a Pratt & Whitney 450 h.p. engine turning a two-bladed rotor of 47 ft. 5 in. diameter. It has a useful load of 1,445 lb., a high speed of 125 m.p.h. and range of 300 miles. As an all-cargo machine, it can carry from 1,000 to 1,200 lb. It is expected that this helicopter will be certificated early in 1947.

**Sikorsky Model S-51:** Four-place helicopter powered by a Pratt & Whitney 450 h.p. engine turning a three-bladed rotor of 48 ft. diameter. It has a useful load of 1,250 lb. and cruises at 85 m.p.h. with a range of 245 miles.

**Sikorsky Model S-52:** This is a two-place helicopter, Sikorsky's newest machine which, at the time of its announcement in November, had not yet flown. It has the first all-metal rotor blades. It is powered by a 178 h.p. Franklin engine and carries a useful load of 650 lb. at a speed of 90 m.p.h. for a range of 310 miles.

**McDonnell XHJD-1:** This was built for the Navy and is the first twin-engine helicopter to fly. Its two Pratt & Whitney 450 h.p. engines are mounted midway on the outriggers which extend from each side of the fuselage and bear the two 40 ft. diameter rotors. As these rotors rotate in opposite directions, there is no need for anti-torque rotor at the rear, such as is used on Bell and Sikorsky helicopters.

The *XHJD-1* except for the outriggers and rotors is about the same size and shape as a conventional medium transport plane. It has two main wheels and tail wheel for landing gear and a vertical fin at the tail to aid stability. It carries a useful load of more than 3,000 lb. and cruises at 100 miles per hour. Through a clutch system, both rotors can be turned by a single engine in case of one engine's failing. As a transport, or in a commercial version, the McDonnell helicopter will carry a crew of two and ten passengers.

Kellett Aircraft Corp. *KH-2* This is a planned commercial version of an Army model, the *XR-10* and, like the McDonnell craft, has two engines. Its two rotors, however, are synchronized and inter-mesh. It has a conventional, transport-type fuselage with triple tail fins and accommodations for 10 passengers. As an alternate, it can carry one ton of cargo. It is powered by two 550 h.p. Continental engines and cruises at 90 m.p.h. for a range of 180 miles.

**Records.** During the year a number of new records were established, mainly by the Army and Navy which set out to measure the result of wartime aeronautical progress against existing performance marks. They succeeded in all main attempts but one: the world's absolute speed record. This had been set in 1945 by a British Gloster *Meteor* jet-propelled fighter plane at 806 miles per hour. On September 7, 1946, this mark was broken with another *Meteor*. Group Captain Edward M. Donaldson attained a maximum speed over a three-kilometer course of 615.778 miles per hour. At about the same time, the Army Air Forces was conducting tests at Muroc Army Air Base with a *Republic P-84* jet fighter, but the maximum speed it was able to reach was about 611 m.p.h., although an unofficial speed of 619 m.p.h. was claimed for it.

While it did not establish a record, the flight in October of a *Boeing B-29 Superfortress* from Hickam Field, Hawaii, over the Arctic to Payne Field, Cairo, Egypt, was a notable achievement in navigation and flying. Commanded by Col. Clarence S. Irvine, the *B-29* flew at an average speed of 240 m.p.h., possibly the fastest ever made for such a long flight. Much valuable information for both the Air Forces and commercial airlines was collected on meteorology, navigation, and the behavior of radio in the Arctic region. Records certified by the National Aeronautic Association, or the Fédération Aéronautique Internationale during the year 1946, were:

**Altitude:** 14,603 meters (or 47,910,009 feet) Maj. F. F. Ross, pilot; Lt. D. M. Davis, co-pilot; Lt. L. B. Barrier, Lt. C. B. Webster, F/O Pamphile Morrisette, Sgt. W. S. George, crew; USAAF, Harmon Field, Guam, M.I., May 15, 1946. (*Boeing B-29* monoplane, 4 Wright R-3850-28A 2,000 h.p. engines.)

**Maximum Speed:** 991 km.p.h. (615.778 m.p.h.) Group Captain Edward Mortlock Donaldson, D.S.O., A.F.O., Great Britain, Gloster *Meteor IV EE 648*, two Rolls-Royce "Derwent" engines, at Littlehampton, September 7, 1946.

**Distance, Airline:** 18,081.990 kms (11,285.600 miles)  
Comdr. Thomas D. Davies, USN; Comdr. Eugene P. Rankin, USN; Comdr. Walter S. Reid, USN and Lt. Comdr. Ray A. Tabeing, USN; United States, *Lockheed P-37-1 Monoplane*, 2 Wright R-3350 engines of 2,800 h.p. each, from Pearce Field, Perth, Australia to Port Columbus, Columbus, Ohio, September 29 to October 1, 1946.

**Speed for 100 Kilometers (62.137 Miles) without Payload:** Speed 796.584 km. p.h. (494.973 m.p.h.) Capt. R. A. Baird, USAAF, United States, *P-80* jet-propelled monoplane, GE-I-40 engine, Dayton, Ohio, April 19, 1946.

**Speed for 1,000 Kilometers (621.369 Miles) without Payload:** Speed 745.079 km.p.h. (462.970 m.p.h.) 1st Lt. Henry A. Johnson, USAAF, United States, *P-80* jet-propelled monoplane, GE-I-40 engine, Dayton, Ohio, June 8, 1946.

**Speed for 2,000 Kilometers (1,242.793 Miles) without Payload:** Speed 708.592 km. p.h. (440.298 m.p.h.) Lt. J. J. Hancock, USAAF, United States, *Lockheed P-80* jet-propelled monoplane, GE I-40 engine, Dayton, Ohio, May 19, 1946.

**Speed for 5,000 Kilometers (3,106.849 Miles) without Payload:** Speed, 544.590 km. p.h. (338.392 m.p.h.): Capt. J. E. Bauer, pilot; Capt. J. E. Cotton, co-pilot; and crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright R-3350-23A engines of 2,200 h.p. each, Dayton, Ohio, July 26, 1946.

**Altitude with Payload of 1,000 Kilograms (2,204.622 lb.):** 14,603 meters (47,910.009 ft.); Major F. F. Ross, pilot; Lt. D. M. Davis, co-pilot; Lt. L. B. Barrier, Lt. C. B. Webster, F/O Pamphile Morrisette, and Sgt. W. S. George, crew, USAAF, United States, Harmon Field, Guam, M.I., May 15, 1946. (*Boeing B-29* monoplane, 4 Wright 2,000 h.p. engines.)

**Speed for 1,000 Kilometers (621.369 Miles) with Payload of 1,000 Kilograms:** Speed 588.456 km.p.h. (365.649 m.p.h.), Lt. E. M. Grabowski, pilot; Lt. J. J. Liset, co-pilot; M/Sgt. D. P. Kelly, Corp. F. M. Polmotier, and Corp. O. W. Lambert, crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,200 engines, Dayton, Ohio, May 17, 1946.

**Speed for 2,000 Kilometers (1,242.793 Miles) with Payload of 1,000 Kilograms:** Speed 588.456 km.p.h. (365.649 m.p.h.), Lt. E. M. Grabowski, pilot; Lt. J. J. Liset, co-pilot; M/Sgt. D. P. Kelly, Corp. F. M. Polmotier, and Corp. O. W. Lambert, crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,200 engines, Dayton, Ohio, May 17, 1946.

**Speed for 5,000 Kilometers (3,106.849 Miles) with Payload of 1,000 Kilograms:** Speed, 544.590 km.p.h. (338.392 m.p.h.), Capt. J. E. Bauer, pilot; Capt. J. F. Cotton, co-pilot; and crew, USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,200 h.p. engines, Dayton, Ohio, July 26, 1946.

**Altitude with Payload of 2,000 Kilograms (4,409.244 lb.):** 14,180 meters (46,522.217 feet) Col. E. D. Reynolds, pilot, Capt. B. L. Kolson, co-pilot, Lt. J. G. Barnes, Lt. Theodore Madden, Lt. K. H. Morehouse, S/Sgt. W. C. Flynn and Corp. A. L. Lentowski, crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,000 h.p. engines, Harmon Field, Guam, M.I., May 13, 1946.

**Speed for 1,000 Kilometers (621.369 Miles) with Payload of 2,000 Kilograms:** Speed, 594.963 km. p.h. (369.692 m.p.h.), Lt. E. M. Grabowski, pilot; Lt. J. J. Liset, co-pilot; M/Sgt. D. P. Kelly, Corp. F. M. Polmotier, and Corp. O. W. Lambert, crew, USAAF, United States, *Boeing B-29* monoplane, 4 Wright 220 h.p. engines, Dayton, Ohio, May 17, 1946.

**Speed for 2,000 Kilometers (1,242.793 Miles) with Payload of 2,000 Kilograms:** Speed 588.456 km.p.h. (365.649 m.p.h.), Lt. J. J. Liset co-pilot; M/Sgt. D. P. Kelly, Corp. F. M. Polmotier, and Corp. O. W. Lambert, crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,200 h.p. engines, Dayton, Ohio, May 17, 1946.

**Speed for 2,000 Kilometers (1,242.793 Miles) with Payload of 2,000 Kilograms:** Speed, 544.590 km.p.h. (338.392 m.p.h.), Capt. J. E. Bauer, pilot; Capt. J. F. Cotton, co-pilot; and crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,200 h.p. engines, Dayton, Ohio, July 26, 1946.

**Altitude with Payload of 5,000 Kilograms (11,023 lb.):** 13,793 meters (45,252.534 feet), Lt. J. P. Tobison, pilot; Lt. Lloyd A. Lee, co-pilot; Lt. D. B. Gleicher, Lt. A. W. Armistead, Lt. R. M. Bearrie, Lt. E. J. Royce, F/O R. F. Johnson and Mario R. Genta, crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,000 h.p. engines, Harmon Field, Guam, M.I., May 14, 1946.

**Speed for 1,000 Kilometers (621.369 Miles) with Payload of 5,000 Kilograms:** Speed 594.963 km.p.h. (369.692 m.p.h.), Lt. E. M. Grabowski, pilot; Lt. J. J. Liset, co-pilot; M/Sgt. D. P. Kelly, Corp. F. M. Polmotier, and Corp. O. W. Lambert, crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,200 h.p. engines, Dayton, Ohio, May 17, 1946.

**Speed for 2,000 Kilometers (1,242.793 Miles) with Payload of 5,000 Kilograms:** Speed, 588.456 km.p.h. (365.649 m.p.h.), Lt. E. M. Grabowski, pilot; Lt. J. J. Liset, co-

pilot; M/Sgt. D. P. Kelly, Corp. F. M. Polmotier and Corp. O. W. Lambert, crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,200 h.p. engines, Dayton, Ohio, May 17, 1946.

**Speed for 5,000 Kilometers (3,106.849 Miles) with Payload of 5,000 Kilograms:** Speed 428.123 km.p.h. (266.023 m.p.h.), Lt. Col. R. G. Ruegg, pilot; Lt. Col. Carl P. Walter, co-pilot; and crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,200 h.p. engines, Dayton, Ohio, June 21, 1946.

**Altitude with Payload of 10,000 Kilograms (22,046 lb.):** 12,668 meters (41,561.597 feet), Capt. A. A. Pearson, pilot; Lt. V. L. Dalbey, co-pilot; Lt. R. S. Strasburg, Lt. I. E. Bork, Corp. J. T. Collins and Corp. Joseph Friedberg, crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,000 h.p. engines, Harmon Field, Guam, M.I., May 8, 1946.

**Speed for 1,000 Kilometers (621.369 Miles) with Payload of 10,000 Kilograms:** Speed 575.714 km.p.h. (357.731 m.p.h.), Capt. J. D. Bartlett, pilot; Lt. William Murray, co-pilot; and crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,200 h.p. engines, Dayton, Ohio, May 19, 1946.

**Speed for 2,000 Kilometers (1,242.739 Miles) with Payload of 10,000 Kilograms:** Speed, 574.593 km.p.h. (357.085 m.p.h.), Capt. J. D. Bartlett, pilot; Lt. William Murray, co-pilot; and crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,200 h.p. engines, Dayton, Ohio, May 19, 1946.

**Speed for 5,000 Kilometers (3,106.849 Miles) with Payload of 10,000 Kilograms:** Speed, 428.123 km p.h. (266.023 m.p.h.), Lt. Col. R. G. Ruegg, pilot, Lt. Col. Carl P. Walter, co-pilot; and crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,200 h.p. engines, Dayton, Ohio, June 21, 1946.

**Altitude with Payload of 15,000 Kilograms (33,069 lb.):** 12,046 meters (39,520.918 feet), Col. B. H. Warren, pilot, Major J. R. Dale, Jr., co-pilot; Lt. W. D. Collier, M/Sgt. Gordon S. Fish, S/Sgt. V. H. Worden and Sgt. Thomas H. Hall, crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,000 h.p. engines, Harmon Field, Guam, M.I., May 11, 1946.

**Greatest Payload Carried to an Altitude of 2,000 Meters (6,561.666 feet) 15,177 Kilograms (33,460 lb.):** Col. B. H. Warren, pilot; Major J. R. Dale, Jr., co-pilot; Lt. W. D. Collier, M/Sgt. Gordon S. Fish, S/Sgt. V. H. Worden and Sgt. Thomas H. Hall, crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright 2,000 h.p. engines, Harmon Field, Guam, M.I., May 11, 1946.

#### HELICOPTERS (CLASS C)

**Duration, Closed Circuit:** 10 hours, 07 mins, 08. secs. Major D. H. Jensen and Major W. C. Dodds, USAAF, United States, *Sikorsky R-5A* Helicopter, Pratt and Whitney 450 h.p. engine, Dayton, Ohio, November 14, 1946.

**Distance, Airline—1,132.337 Kilometers:** (703.6 miles), Major F. T. Caschman, pilot; Major W. E. Zins, co-pilot; USAAF, United States, *Sikorsky R-5* Helicopter, Pratt and Whitney 450 h.p. engine, from Dayton, Ohio to Logan Field, Boston, Mass., May 22, 1946.

**Distance, Closed Circuit—1,000 Kilometers:** (621.369 miles), Major D. H. Jensen and Major W. C. Dodds, USAAF, United States, *Sikorsky R-5A*, Helicopter, Pratt and Whitney 450 h.p. engine, Dayton, Ohio, November 14, 1946.

**Speed for 20 Kilometers in a Closed Circuit:** Speed, 178.394 km.p.h. (110.849 m.p.h.), Lt. Col. K. S. Wilson, USAAF, United States, *Sikorsky R-5*, Helicopter, Pratt and Whitney 450 h.p. engine, Dayton, Ohio, June 8, 1946.

**Speed for 1,000 Kilometers in a Closed Circuit:** 107.250 km.p.h. (66.642 m.p.h.), Major D. H. Jensen and Major W. C. Dodds, USAAF, United States, *Sikorsky R-5A* Helicopter, Pratt and Whitney 450 h.p. engine, Dayton, Ohio, Nov. 14, 1946.

**Los Angeles to New York:** Speed 934.926 km.p.h. (580.935 m.p.h.), Col. W. H. Council, USAAF, United States *P-80* jet propelled monoplane, GE-I-40 engine, from Long Beach Municipal Airport to La Guardia Airport, January 26, 1946. Distance, 2,458.807 miles. Elapsed Time: 4 hours, 13 minutes, 26 seconds.

**Los Angeles, California to New York, New York:** Speed, 724.826 km.p.h. (450.385 m.p.h.), Col. C. S. Irvine, pilot; Lt. G. R. Stanley, co-pilot, and crew, USAAF, United States *Boeing B-29* monoplane, 4 Wright R-3350-23A engines, from Burbank, California to Floyd Bennett Field, Brooklyn, December 11, 1945. Distance 2,457 miles. Elapsed Time: 5 hours, 27 minutes, 19.2 seconds.

**New York, New York to Los Angeles, California:** Speed 528.828 km.p.h. (328.598 m.p.h.), Capt. Boyd L. Grubbaugh, pilot; Capt. J. L. England, co-pilot; and crew; USAAF, United States, *Boeing B-29* monoplane, 4 Wright R-3350-23A engines, from La Guardia Airport to Burbank, California, August 1, 1946. Distance: 2,458.805 miles. Elapsed Time: 7 hours, 28 minutes, 08 seconds.

**Bibliography.** Aeronautical books published during 1946 (as compiled by the Aeronautics Division of the Library of Congress) included the following:

*The Aircraft Year Book for 1946* (New York; 702 p.); Anderson, *Pathfinders* (London; 112 p.); Cleveland and Graham, *The Aviation Annual of 1946* (New York; 245 p.); *Aviation Education Source Book*, prepared by the School of Education, Stanford University (New York; 835 p.); Barker, John S. (editor) *Flight of the Liberators* (Rochester, New York; 172 p.); Bollinger, Lynn L. and others, *Terminal Airport Financing and Management* (Boston, Harvard University Graduate School of Business Administration; 385 p.); Brewer, Griffith, *Fifty Years of Flying* (London Air League of the British Empire; 170 p.); Brickhill, Paul and Conrad Norton, *Escape to Danger* (London; 341 p.); Brinkley, R., *Your Postwar Place in Aviation* (New York); Bullot, Ivan, *Air Travel Guide to Latin America* (New York; 369 p.); Burbidge, William F., *From Balloon to Bomber* (London; 238 p.); Burger, Samuel, *Careers in Aviation* (New York; 209 p.); Chapel, Charles Edward, *Aircraft Electricity for the Mechanic* (New York; 477 p.); Collins, A. Frederick, *Science for Young Men* (New York; 257 p.); Davis, Maxine, *Through The Stratosphere* (New York; 253 p.); Decker Air Services, *Airport Guide* (Fairfield, Conn.); Drake, R. H., *Aircraft Woodwork* (New York; 197 p.); Gerald and Lillian Dykstra, *The Business Law of Aviation* (New York; 523 p.); Fakey, James C. U.S. Army Aircraft, 1908-1946 (New York; 64 p.); *First Denver Congress on Air Age Education* (Denver, Colorado; 139 p.); Ford and MacBain, *Last Time I Saw Them* (New York; 244 p.); Francis, Devon Earl, *The Story of The Helicopter*, (New York; 182 p.); Frederick, John H., *Commercial Air Transportation*, (Chicago; 791 p.); Froesch, Charles, *Airport Planning* (New York); Gann, Ernest K., *Blaze of Noon* (New York; 298 p.); Gibson, Guy, *Enemy Coast Ahead* (London; 302 p.); Gilpatric, Guy, *Flying Stories* (New York; 287 p.); Goddard, Robert Hutchings, *Rockets* (New York); British Ministry of Information, *Merchant Airmen* (London; 207 p.); Grierson, John, *Jet Flight* (London; 270 p.); Group publishers, *CAA Pilot Certificates for Military Pilots* (Los Angeles, Calif.); Harper, Harry, *Dawn of the Space Age* (London; 142 p.); Hemke, Paul Emil, *Elementary Applied Aerodynamics* (New York; 231 p.); Horsley, Terence, *Soaring Flight* (New York); Arthur J. Hughes, *History of Navigation* (London; 154 p.); Isaac, David W., *Flight Lines* (New York; 64 p.); Katz, Hyman H. *Aircraft Drafting* (New York; 386 p.); Knapp, Sally, *New Wings for Women* (New York; 179 p.); Lampell, Millard, *The Long Way Home* (New York; 174 p.); Lee, Asher, *The German Air Force* (New York and London; 310 p.); Lloyd, F. H. M. *Hurricane* (London; 136 p.); MacFarland, Ross A. *Human Factors in Air Transport Design* (New York; 670 p.); Miller, Merle and Abe Spitzer, *We Dropped The A-Bomb* (New York; 152 p.); Nelson, Hugh, *Dictionary of Aeronautical Terms* (London; 178 p.); *Pilot's Pocket Information File* (Los Angeles); Sherwood, A. Wiley, *Aerodynamics* (New York and London; 220 p.); Stevens, Alfred Hull, *The How of the Helicopter* (New York; 58 p.); Sutton, Barry, *Jungle Pilot* (London and Toronto); Taylor, Leonard, *The Story of the Air Training Corps* (London); Ten Eyck, Andrew, *Jeeps in the Sky* (New York); Thorne, Robert H. *Aircraft Carburetion* (New York; 394 p.); Vale, John W. *The Aviation Mechanic's Engine Manual*

See ARMY AIR FORCES, U. S.

L. WELCH POGUE.

**AFGHANISTAN.** A kingdom in central Asia. Area: 251,000 square miles. Population, according to the latest estimate, 12,000,000. Chief towns: Kabul (capital) 120,000 inhabitants, Kandahar 80,000 (including suburbs), Herat 85,000, Mazar-i-Sharif 30,000. Afghanistan has an extreme width from the northeast to the southwest of approximately 700 miles, and its length from the Khyber Pass to the Herat frontier is estimated at about 600 miles.

**Religion, etc.** Most of the people are Moslems of the Sunni sect, though there is a minority of a million Shia Moslems. Persian, Pashto, and Turki are the principal languages. There are some 20,000 mullahs (priests) who wield great power, including the administration of justice and a large measure of control over education. Primary education is compulsory. Schools in 1941 included 130 primary, 4 secondary and 3 military schools. A university was established in Kabul in 1932.

**Finance.** Afghanistan's revenue is subject to yearly fluctuations. The total annual revenue of the government is estimated at 220 Afghani rupees, a substantial amount of which is derived from the government's share of agricultural produce (based in accordance with the advantages of irrigation), customs, land taxation, and the earnings of government-controlled monopolies—the principal one being the karakul monopoly.

**Production.** Agriculture and stock raising are the chief occupations, the main products being cereals, fruits, vegetables, cotton, wool, hides and skins, and meat from the native fat-tailed sheep. The mineral resources include iron, copper, lead, gold, silver, lapis lazuli, coal, and petroleum, but there is little production. There are state-owned factories at Kabul, Kandahar, and elsewhere for the manufacture of arms, ammunition, boots, military clothing, furniture, matches, buttons, leather, soap, cotton goods, and wool products.

Factories were being constructed (under government supervision) by the Afghan National Bank and its subsidiary companies. These include the Afghanistan Sugar Manufacturing Co., the Afghanistan Cotton Co., the Afghanistan Motor Co., the Afghanistan Motor Accessories Co., the monopoly on the generation of electricity and import of electrical goods, and the monopoly of the north engaged in trade in wool, skins, fruits, and other goods.

**Foreign Trade.** Commerce is mainly with India, the Soviet Union, and Iran. The chief exports are fruits, nuts, timber, spices, cotton, carpets, wool, and furs. Cotton textiles, machinery, gasoline, kerosene, sugar, motor vehicles, and tea are the main imports.

**Communications.** Afghanistan has no railways and practically no navigable rivers. Four thousand miles of roads are suitable for motor transport in dry weather, and trucks are increasingly replacing pack animals as the chief means of transportation.

There is an all-weather motor highway from Kabul to Peshawar, India; a 500-mile motor route from Stalinabad, Soviet Turkestan, to Khorog on the Afghan border; and a trade route linking Kandahar to the Indian railhead at Chaman. Telephones are installed in most of the towns. Five radio stations serve the country and there is a radio installation which connects Kabul with Europe, the Far East, America, and other parts of the world.

**Government.** Under the Constitution of Oct. 31, 1931, Afghanistan is a constitutional monarchy, with legislative power vested in the King, a senate of 45 members nominated for life, and a national assembly of 109 elected members. Actually the state consists of a loose federation of tribes under the patriarchal rule of the family controlling the government at Kabul. Through the influence of his uncle, Shah Mahmoud, the Minister of War, Mohammed Zahir Shah succeeded to the throne after the assassination of his father, Mohammed Nadir Shah, in 1933 and remains the reigning King. King Nadir proclaimed a new constitution in 1932 under which slavery and forced labor were forbidden.

**Events, 1946.** Few details were available of Afghanistan's internal political situation during 1946. On January 24 Russian agencies reported the arrest of Abdurahim Khan, Deputy Prime Minister, and several of his relatives on charges of activities against the Government. Other indication of Afghanistan's political complexion was reported on May 13 through Moscow radio which stated that King Mohammed Zahir Shah had dismissed his Cabinet and requested former Minister of War, Shah Mahmoud Khan to form a new Government.

Afghanistan and the Soviet Union negotiated a frontier agreement on June 14 that provided Afghanistan with water rights on the Kushka River and gave the Soviet Union full possession of the Kushka district in the southern part of Turkmen Soviet Republic. According to the explanation of the treaty in *Izvestia*, agreement was also reached on the construction of a Russian dam on the Murghab River in the sector adjoining the frontier and decision was made to consider null and void clauses 9 and 10 of the Soviet-Afghan agreement of 1921 which stipulated that Afghanistan could annex the Kushka area if the population of the region so desired. The treaty was negotiated in secret.

During 1946 efforts were made to raise the standards of Afghanistan's economy and educational system. On August 8 Premier Shah Mahmoud announced that the size of the army would be reduced because of "America's championship of the small nations" and that "our talents and resources" can be concentrated on "bettering the living conditions of our own people." In the early part of the year a national improvement plan, at an expected cost of \$450,000,000 was outlined. American engineers began arriving in July to initiate work on the ten-year program for macadamizing 1,800 miles of highways, constructing bridges, increasing tillable soil by irrigation, and modernizing the country's ancient cities.

Admission to the United Nations was requested in early July by Mahmoud Khan who stated in a cable message from Kabul that Afghanistan had proved itself a peace-loving state and was willing to abide by the obligations of the United Nations. In January Dean Acheson, Acting United States Secretary of State, said that Afghanistan was the only neutral nation to fully comply with the United States request for the deportation of objectionable Germans.

Afghanistan was admitted to the United Nations

on November 9 by a unanimous vote of the General Assembly and the instruments of adherence to the United Nations Charter were signed on November 19.

**AFRICA.** A continent of the eastern hemisphere. Area, about 11,710,000 square miles (30,330,000 square kilometers). Population (Jan. 1, 1940, estimate), 157,900,000. See the separate articles on its subdivisions, countries, and territories, such as BRITISH CENTRAL AFRICA; BRITISH EAST AFRICA; BRITISH WEST AFRICA; EGYPT; ETHIOPIA, KENYA, FRENCH NORTH AFRICA; MOROCCO, SOUTH AFRICA, UNION OF; TUNISIA.

**AGRICULTURAL AND INDUSTRIAL CHEMISTRY, Bureau of.** A Bureau of the U.S. Department of Agriculture, composed of two Bureaus originally created in 1901. It is a research organization engaged in investigations and experiments in the fields of chemistry, physics, and other physical sciences with the object of gaining new fundamental scientific knowledge relating to agriculture, improving agricultural methods, and developing new and wider industrial uses for agricultural products. The four regional laboratories for Research on Utilization of Farm Products conduct investigations to develop new and wider industrial uses for agricultural commodities. Chief: L. B. Howard.

**AGRICULTURAL COOPERATION.** Cooperation is organized working together for mutual benefits. Economic cooperation is a form of business with democratic ownership and control by member-patrons having common needs, serving themselves on a nonprofit basis, and receiving benefits proportional to participation. Through agricultural cooperatives the small farmer assures for himself the same efficient service and the same favorable terms as were formerly too often obtained only by the large farmer.

Agricultural cooperatives generally have been working at plant capacity during 1946. They have felt shortages of farm machinery, plant equipment, materials for building and renovating facilities, and shortages of labor. They have tended to keep operations as flexible as possible in view of the uncertainties of price and other factors. For them the year has been a period of self-appraisal, examination, and refiguring of goals.

Growth has again been evident. Marketing associations returned to their patrons for crops sold, \$4,835,000,000. Cotton, dairy, fruits and vegetables, grain, livestock, poultry, tobacco, wool, and mohair were the main commodities handled. Farm supply associations purchased for their patrons production supplies and equipment, principally fertilizer, petroleum, feed, and farm machinery, valued at \$810,000,000. The sum of business done by the associations of these two types was \$5,645,000,000.

In approximate figures, 7,400 marketing cooperatives served a membership of 2,895,000 farmers and 2,750 purchasing associations had a membership of 1,610,000 during 1944-45. In round numbers, 2,200 associations marketed dairy products; 2,280, grain; 916, fruits and vegetables; 791, livestock, wool, and mohair; 530, cotton and cotton products; 160, poultry and poultry products; and about 500 handled other crops and furnished a variety of business services.

In the commodity fields, dairy, grain, and fruits and vegetables showed the largest volume. Continued consolidations and more large-scale plants for the dairy cooperatives are features of the year. Formation of new milk distributing groups con-

tinued, especially in the South and in the East. As relatively few producer-distributors of raw milk can convert to processing and distributing pasteurized milk, in sections where demand for pasteurized milk has risen, many farmers have pooled their resources to form dairy cooperatives.

Both local and regional grain elevators have started to expand again. Total storage of regionals has passed the 40 billion bushel mark. Grain cooperatives showed a small decrease in number but a substantial increase in membership and business volume. Members of the Farmers Union Grain Terminal Association, in response to the call of the Famine Emergency Committee to ease distress abroad, took part in a move to aid other Nations by literally scraping their bins and coming up with one-fifth of all the U.S. Mercy wheat shipped abroad. Planting-seed associations continue toward the goal of bringing higher yields to farmers by providing purebred, tested, high-production strains of farm seeds.

Fruit and vegetable associations stepped into third place among the marketing groups. Efforts to bring fresher, better prepared and packaged perishables continued. Prepackaging of perishables at the shipping point continued in its trial stage. Moderate investments have been made in dehydration equipment, and installation of freezing equipment has been accomplished. Rapid adjustments to changing conditions have been an order of the day.

The trend toward decentralization of the livestock cooperatives continued with several of them obtaining local markets by which to serve more producers at country points. Cooperative packing and also rendering plants are on the increase.

Several additional broiler associations have been started this year. Three cotton cooperatives introduced the solvent extraction method for cottonseed oil, by which they hope to get out more of the oil. Newcomers among tobacco cooperatives are an association to market flue-cured tobacco from the five flue-cured tobacco States, and an auction for selling cigar tobacco in Pennsylvania. Cooperative honey groups are in good condition and give promise of doing much to help stabilize the honey market when more normal conditions return.

Frozen-food locker groups have been working toward processing plants offering facilities for all services, from slaughtering of livestock to final processing of meat and rendering of lard. Centralized slaughtering and processing facilities, serving not only locker plants, but also retail outlets and institutional consumers have appeared in several parts of the country.

A typical development in cooperative coordination among the farm-supply purchasing associations is the erection of a feed mill by the Tennessee Fertilizer Cooperative on the Tennessee River at Decatur, Alabama, and adjoining this, a marine terminal grain elevator by the Indiana Grain Cooperative. Grain will be transported by river barge from the surplus grain-producing areas of the Midwest, and at this point made into feed for farmers of the feed-hungry South who are rapidly increasing their livestock production. Another movement is being pioneered to decentralize feed manufacture down to a county basis. To a premix containing proteins, vitamins, and minerals prepared in a central mill is added local grain to make complete feeds. Land has been leased in Kentucky looking toward the operation of the first coal mine to be fully owned and operated by cooperatives in this country. A good start has been made in cooperative distribution of liquefied petroleum gas, which will bring to farms not reached by electric power lines a con-

venient gas for cooking, refrigeration, etc. Expansion of farmers' supply associations has been noted all along the line, but on a conservative basis.

Increasing enrollments were also general among the service cooperative groups. Farmers' mutual fire insurance companies continued their leadership in the farm fire insurance field with 1883 companies reporting insurance in force totaling \$14,701,000,000 at the beginning of 1945—the most recent date for which figures are available. Other types of farmers' mutual property insurance include windstorm and hail protection and automobile coverage.

Four thousand mutual telephone companies provided about one-third of the telephones on American farms. Mutual irrigation companies in seventeen States brought water to one-third of the Nation's irrigated lands.

Cooperative hospitals were located in four small communities in Texas, Kansas, and Oklahoma, and other States were developing similar plans for hospitals or health centers to provide services on a cooperative prepayment plan. In many States the members of cooperative marketing and purchasing associations have adopted existing prepayment plans for health protection. By June 1946, nearly 30,000 members of Minnesota farm families were enrolled in Group Health Mutual through cooperative creameries, oil associations, grain elevators, and other farm organizations. In several States health coverage was had through mutual insurance companies. By June 1946, the Blue Cross nonprofit hospital service plans were reported to cover more than one million rural persons in the United States.

Farmers also obtained long-term loans cooperatively through 1,450 National Farm Loan Associations, short-term loans through 504 Production Credit Associations and through Credit Unions.

Finally this year has seen the National Council of Farmer Cooperatives, with a membership of 102 associations, which in turn have over 4,600 local cooperatives with a membership of 2,300,000 farmer-patrons hold its 17th annual meeting. The war-canceled summer sessions of the American Institute of Cooperation were resumed after being discontinued for 1942-1945.

Perhaps most far-reaching of all were the results of this year's meeting of the International Cooperative Trading Agency in Zurich, Switzerland, where plans were made by representatives of twenty-two Nations for a new association to be known as the International Cooperative Petroleum Association. In the words of the delegate from the United States: "Any nation striving to reach maximum development, agriculturally and industrially, must have adequate petroleum supplies at reasonable prices. The new organization is an important step toward lower ultimate prices to the consumer. It can help the nations of the world to achieve such developments without resort to statism or dependence on profit-monopoly."

WARD W. FETROW.

**AGRICULTURAL ECONOMICS**, Bureau of. A Bureau of the U.S. Department of Agriculture created in 1922 by the merger of three existing units. It is the central statistical and economic research agency of the Department, and publishes a wide variety of facts about agriculture. Chief: Howard R. Tolley.

**AGRICULTURE**. Crop production in the United States in 1946 exceeded that of any previous year. Food grains, feed grains, truck crops, and fruits and vegetables were record out-turns. Livestock products, however, made an aggregate quantity about

6 percent below that of 1944, and 10 percent below the high mark of 1943; yet the volume of livestock and livestock products was greater than in any year before 1942. Total milk production at about 119 billion pounds was 3 percent below the 1945 record and reflected a reduction of about 4 percent in the number of cows milked. Milk production per cow was a record. The cotton crop, less than 9 million bales, was among the smallest since 1900; both the acreage and the yield per acre were low. Farm production for sale and for consumption in farm households was about the same as in 1945, or approximately one third above the prewar (1935-39) average. Output of food for sale and farm consumption, as distinguished from total farm production, was about 36 percent above the prewar average. Farm production showed a smaller percentage increase over prewar levels than did the output of the nation's factories, but came from about the same crop acreage and from a working force depleted 10 percent; whereas the industrial increase reflected a tremendous increase both in the industrial plant and in the industrial labor force. Further particulars of the year's production appear later in this article.

Sources of our enormously increased food potential primarily are technical. They show up in steadily increasing farm efficiency. Quietly and gradually, yet with prodigious cumulative effect, American agriculture has accomplished a technical revolution. Largely it has done so in less than a decade, though with processes of earlier origin. This revolution takes form in increased farm mechanization, in increased use of fertilizer, in the employment of improved crop varieties and livestock, in the widespread application of scientific pest controls, and in scientific soil conservation. Agriculture's technical progress has produced few novelties. Nevertheless, its progress along many lines adds up to results highly significant and much happier in world implications. Moreover, the agricultural revolution continues. Provided we solve the problem of maintaining an adequate domestic and foreign market, it will continue to provide increased well being.

**Total Output Below Demand.** Contrary to apprehensions felt when the year began, the farm output did not exceed the demand except in a few items, notably potatoes. As during the war years, it was much below total domestic and foreign requirements. In this and in other important respects the year's developments differed from most forecasts, which had indicated that the termination of the war might diminish the drain upon the American food supply and replace shortages with surpluses. It was evident that liberated and ex-enemy countries would be short of food; but the known requirements on January 1 were considerably smaller than they became later. Farm operators expected to restore their normal crop rotations, diminish their acreage of soil-depleting crops, and prepare in other ways for ordinary peacetime conditions. It seemed after V-J day that the farm price supports, which in the war years had served the double purpose of encouraging farm production and protecting the farmers from price declines, would need to put more emphasis on the second purpose. Actually, the emphasis was again on maximum production. Farmers had to defer their plans for returning fully to conservation types of cropping, while government agencies had to continue using the price-support program primarily as a means of encouraging production. Largely, of course, the response to the world-famine need drew on stocks; but continued all-out production

was necessary to make that operation reasonably safe.

Again, however, the crop of potatoes was above what the United States required for food, seed, starch, and other domestic purposes. It was a near-record crop, and we faced the probability of large potato production in 1947. As estimated in September, the 1946 output was about 455 million bushels; that of last year was 425 million. Our 1946 crop was the output, moreover, of an acreage slightly below the average; but it reflected the general recent trend toward shifts in the commercial potato-enterprise from low- to high-yielding areas. In addition, it reflected the influence of improved cultural practices and of generally favorable weather. Supplies were in excess of demand at support price levels, just as they were in 1945, and left another substantial surplus for disposal in other than the usual market channels.

**American Food as Builder of Peace.** Leaders in the government, in the military services, and in civilian life declared American food was as useful and necessary for the immediate purposes of peace as it had been for the objectives of the war. Military authorities said that without food supplies, sufficient at least for minimum needs in occupied areas, occupation tasks could not be done. Food requirements were also high in liberated, allied, and friendly countries, not to mention the United States. Necessarily, the United States was the largest supplier of relief foods; it was not only the largest and nearest source both for Europe and the Orient, but was practically the only source of exportable foods where production in 1945, because of drought or other reasons, had not declined. Crop failure elsewhere was widespread in that year, as the result partly of difficulties directly attributable to the war and partly of devastating droughts. Severe damage to 1945-46 crops occurred in southern hemisphere food-surplus countries, in the Mediterranean and Danube basins, and in India. Farm production in many countries suffered also from shortages of seed, draft power, and fertilizer. Without American food, deaths from starvation might have run into the millions. Millions were still hungry after our food had reached the devastated countries, but actual starvation was rare.

**United States Consumption High Despite Exports.** The tremendous exports of food from the United States, some particulars of which are given below, did not prevent United States consumers from getting an adequate diet. Civilian consumption of some food items declined, even to levels below prewar. Other foods, however, were available in exceptionally large supplies, with the net result that aggregate civilian consumption per capita established a new high record at about 15 percent above the prewar (1935-39) level. Toward the end of 1946 the domestic food situation was about the same as it was in 1945 after V-J day. Supplies of major nutrients were still at the high wartime level, with especially plentiful supplies of fruits, vegetables, and fluid milks. Meat supplies for civilians were larger in 1946, until late in the fall, than in the previous year. Chickens and sweet potatoes were less plentiful. Fresh and frozen fish were plentiful; more canned fish was available than in 1945; and egg supplies were relatively large. Temporarily, food grain products were below the usual civilian demand but returned to the normal position when the famine emergency abroad eased off. Potatoes were continuously plentiful. Consumers sometimes could not square the report of an average civilian food consumption

much above prewar with their own experience of shortages. Largely, the explanation lay in better average distribution, especially among the lower-income groups. In calories the United States civilian food consumption per capita in 1946 averaged 3,300 daily, as compared with less than half that in many countries.

**Relief and Other Exports.** Our export contribution to the famine emergency was about the same as the quantity exported in 1921, the third year after the end of World War I. This time the relief rose to a high point much sooner. Authorities believed the 1945-46 food exports, which from the United States amounted to 16½ million long tons, would represent the peak of the movement, but would level off only rather slowly throughout the following year, since reports indicated privation would continue at least until the harvests of 1947. The 16½ million tons of foodstuffs, which this country sent overseas in fiscal 1946, went chiefly to war devastated countries, where starvation threatened. This total included no less than 400 million bushels of bread grains, principally wheat and wheat flour. Approximately 192 million bushels moved out in the second half of 1945. Shipments of bread grains between January 1 and June 30, 1946, fell slightly below the commitment for that period, but supplies on hand at ports ensured fulfillment of it within a week or so. The United States also exported substantial quantities of rice, oats, rye, barley, meats, fats and oils, fruits and vegetables, sugar, eggs, and dried fish. More than 40 percent of the United States wheat distributed as food in fiscal 1946 was exported, more than 35 percent of the rice, more than 20 percent of the cheese, more than 10 percent of the fats and oils, and about 6 percent of the meat.

All told, the exports were sufficient to provide 250 million people with 500 calories each day for one year. Largest recipients were the UNRRA countries. Civilian relief programs of the United States armed forces accounted for a substantial part of the food exports. Commercial exports took less than one third. Distribution of the American food supply in 1946 differed substantially from that of the war years. Our military establishment took only 3 percent for all purposes, as compared with 12.7 percent in 1944. Exports for all purposes accounted for 7 percent; and this item may be compared with 7.7 percent devoted in 1944 to lend-lease and other exports. Civilian consumption in the United States absorbed 90 percent of the food disappearance in 1946, as compared with 80.3 percent in 1944.

**Export Proportion Relatively Small.** These figures draw attention to the fact that even under the most abnormal conditions, with our food production lifted far above the peacetime average, the great bulk of the disappearance continues to be domestic. Commercial and other exports accounted for only about 2.6 percent of the disappearance in the prewar period 1935-39. Even in 1944, with total food disappearance 37 percent above prewar, the disappearance for purposes other than United States civilian consumption absorbed slightly less than 20 percent. As mentioned in 1944 takings by the United States military accounted for nearly 13 percent of the entire disappearance. In volume the 7 percent left for exports of all kinds represented a large contribution to foreign requirements, since it came from a greatly expanded total output; but percentage wise it was not much of a dip into the American food supply.

**Beginning of the Relief Movement.** When 1946 began the United States was already exporting large

quantities of food in response to requests by the armed forces, by UNRRA, and by paying countries. After a temporary drop, military requisitions for overseas purposes had started up again. Takings by paying countries, especially of wheat, were rising. In December 1945 exports to UNRRA countries alone exceeded \$63,000,000 in value and with commercial exports added made an overseas movement much larger than that of a year earlier. Nevertheless, the shipments were far below the need. Famine threatened whole continents. Up to that time, though it was evident the relief demand would be large, adequate preparation to meet it had not been made. It had been expected that cut-backs in total military requirements, possibly supplemented with transfers of stocks abroad from military to relief uses, would go a long way toward answering the need. But this view proved far too optimistic. Needs in food deficit countries increased as a result of the 1945 droughts, and from too rapid consumption of food reserves. Analysis of the problem forced a drastic scaling down in estimates of available supplies and an equally drastic raising of estimated requirements. Also, it emphasized the need for a campaign to conserve and assemble foods for shipment overseas. By January 1, UNRRA had been assured of a total United States contribution of \$2,700,000,000, of which \$2,160,000,000 had been appropriated. But civilian consumption was rising, and a conservation program was essential.

President Truman had previously drawn attention to the prospective world food shortage. He had pointed out on his return from Potsdam in August, 1945, that sheer starvation threatened many countries. Even earlier the United States Department of Agriculture had issued sobering estimates of probable postwar food needs; it had predicted a huge food import need in Oriental countries as well as in Continental Europe. In October 1945 the Department reported that the world food situation had deteriorated, and pointed to import needs for Continental Europe in 1945-46, at not less than 18 million short tons. Food grain was the principal requirement, with fats and oils next. In February, 1946, the President announced a nine-point famine-emergency campaign, which his announcement said would inconvenience consumers, food trades and industries, and transportation systems, but would save lives, lessen suffering, and help to establish peace. Following were the nine points: (1) Conservation of food, especially bread; (2) disuse of wheat and restricted use of other grains for alcohol and beer; (3) extraction of more flour from wheat along with restriction of flour distribution; (4) control over inventories of wheat and flour; (5) rail priorities for essential foods; (6) control over exports of wheat and flour; (7) exports of fats and oils, meats, and dairy products; (8) provision of more ships to move exports; and (9) conservation of grain in the feeding of livestock.

**The Department of Agriculture's Responsibility.** To carry out this program became largely a responsibility of the Department of Agriculture, which issued necessary food orders, procured supplies, and arranged with the Office of Price Administration for suitable price changes. Specifically, the Department reinstated protein meal set asides, limited the use of grain for industrial and beverage alcohol, increased the wheat extraction rate for flour, restricted mixed feed production and inventories, and restricted the sale and use of wheat mill feeds. In addition, the Federal agricultural agency reinstated meat set asides, terminated a

cattle-feeding subsidy in order to conserve grain, announced increases in the ceiling prices for wheat, and offered a bonus for early wheat deliveries. President Truman appointed a Famine Emergency Committee with former President Herbert C. Hoover as honorary chairman and Chester C. Davis as chairman. Also, the President appointed a National Famine Emergency Council. The campaign began to show results immediately. Our exports of agricultural commodities in the first quarter of 1946 rose above 846 million dollars in value, and were almost 70 percent greater than in the first quarter of 1945. Overall figures for the entire fiscal year 1946, as given above, enabled the administration to say in July that the United States had reached export quotas in practically all cases, and in grains had shipped out nearly double the original requirement for the year, along with 764,000 tons of dairy products, 614,000 tons of meats, and 356,000 tons of fats and oils.

**Combined Food Board Replaced.** The Combined Food Board was replaced by the International Emergency Food Council on July 1, 1946. The Combined Food Board was a wartime agency through which arrangements were made to utilize to best advantage the food resources of the allied nations. The United States, the United Kingdom, and Canada were represented on the Board itself. Before peace came, the Board's commodity committees were expanded to include representatives of major exporting and importing countries. The persistence of serious world food shortages made it necessary for the Combined Food Board to continue its work after the termination of hostilities.

At the Special Meeting on Urgent Food Problems, convened by the Food and Agriculture Organization of the United Nations on May 20, it was agreed that emergency machinery to deal with the distribution of foodstuffs in short supply would continue to be necessary for the duration of critical world shortages. A recommendation was approved for the establishment of the International Emergency Food Council, which was expected to operate for at least eighteen months. The new agency held its first meeting on June 20, and officially replaced the Combined Food Board on July 1. Nineteen nations accepted membership at the outset: Australia, Belgium, Brazil, Canada, Chile, China, Cuba, Denmark, France, Greece, India, Netherlands, New Zealand, Norway, Siam, Turkey, Union of South Africa, the United Kingdom, and the United States. The Council elected the following nine nations to membership on its Central Committee: Argentina, Australia, Canada, China, Denmark, France, India, the United Kingdom, and the United States.

The transfer of functions from the CFB to the IEFEC was facilitated by the fact that CFB commodity committees included representatives of major exporting and importing countries. The IEFEC drew its initial membership from nations represented on CFB commodity committees.

**Wartime Farm Intensity Maintained.** As mentioned, farmers in 1946 could not relax the intensity of their cropping, or much reduce the continued drain on fertility reserves. Acreage in farms was relatively stable during the war years, but crop acreages shifted in response to needs. The relationship between intertilled, close-growing, and sod crops in 1946 was not greatly different from that of 1945. Marked shifts from wartime cropping patterns had not begun. For example, acreage planted to soybeans and flaxseed was still well above prewar levels, though down from the war-

time peak. In areas adapted to both crops corn was generally more profitable than soybeans; moreover, soybeans were erosive on rolling land. Flaxseed, an uncertain crop in many areas, declined because farmers were reluctant to grow it with the wartime compulsion past. Sugar-beet acreage regained the 1937-41 average level, through an increase of 19 percent over 1945. Higher price support placed this crop in a more favorable position, and an easier labor situation helped. Tobacco acreage rose 8 percent over 1945. Conspicuous among the grains was a 4 percent increase over 1945 in planted acreages of both wheat and oats. World-wide needs and continued high prices stimulated wheat expansion, while weather conditions favored an increase in the oat acreage. Corn acreage changed little.

Livestock numbers decreased, and also milk production. Egg production was not greatly different from that of 1945. Chickens and turkeys raised, were between 10 and 15 percent less. The spring pig crop was comparable to that of a year earlier; the number of fall pigs much less.

Less than one in six of our people lived on farms at the opening of 1946 but the total farm population, which had been drifting steadily downward since 1933, showed a reversal of this trend.

Farm output of food, fiber, and tobacco for human use was considerably larger than the average for the 5 prewar years 1935-39. It was not greatly different on the whole from that of 1944, the last full year of the war, when output was 29 percent higher than the prewar 5-year average. Each farm worker in 1944 produced 40 percent more for human use than the 1935-39 average. Long days in the fields and barns with efficient machines, tools, and livestock, largely produced this astonishing gain. Good weather helped, but with the effect of better-than-average weather eliminated, farm output in 1944 was still one-fifth larger than the prewar average.

Major technological developments made this possible. Soil conservation, better seeds and plants, improved strains of livestock, more fertilizers and lime, and less waste in storage and transportation were major factors. More and better labor-saving machines and tools were important helps. The displacement of horses and mules by tractors and other power machines was a contributing factor. With less land required to feed horses and mules, more was available for the production of food, fiber, and tobacco. Machinery released seven million crop acres during the 5 high-yielding war years, and released 52 million crop acres during the last 25 years.

**Agriculture's Working Force.** By the middle of 1946 the number of persons working on farms was 11,586,000, or nearly a half million more than a year earlier. The increase over 1945, which continued each month after the early spring of 1946, contrasted sharply with the fairly steady decline between 1940 and 1945, which averaged 150,000 a year. Agricultural employment in June and July, had regained 41 percent of the decrease recorded between 1940 and 1945. But with farm labor's productivity increased by mechanization and other means it is doubtful if the number of farm workers will need to rise to its prewar level.

Considerable change took place in the composition of the farm working force. In the war years, experienced farm hands often had to be replaced with women, youths, older persons, or nonfarm people. Thus in 1943, the farm working force included 2.1 million housewives and 1.1 million youths of school age. In 1945 high school age

youths from 14 to 17 made up one-fifth of the hired farm workers.

By July 1946 the return of veterans to agriculture had reached about 1 million, and the proportion of men among agricultural workers had risen significantly. The entire increase of 485,000 over July 1945 took place among males. Other changes included the removal of 71,000 prisoners of war, and a reduction of 20,000 in the number of imported foreign workers. The increase in the total farm labor supply did not weaken agricultural wage levels. Ample job opportunities in both town and country maintained an upward trend, and brought farm wage rates to the highest level on record. Wage rates of hired farm workers in the United States on July 1 were 8 percent higher than a year earlier. Average rates without board were \$4.84 per day and \$106 per month.

**Farm Income in 1946.** It seemed from indications in the fall that the net income of farm operators in 1946 might be as much as 8 percent greater than that of 1945. Net income is what the farmers have left after subtracting their expenses of production from their gross income. It is the amount available for farm family living, savings, etc.

Production expenses for 1946 ran about 11 percent above those of 1945. Some of the items involved may be noticed. Expenditures for purchased feed, for example, were higher, partly because feed prices had risen and partly because the farmers in the first half of the year fed their livestock more liberally. Expenditures for hired labor were greater than in the previous year, reflecting a slight increase in the number of hired workers employed at higher wage rates. Costs or charges for farm maintenance and depreciation averaged higher, in part because farmers were able to obtain larger supplies of farm machinery and motor vehicles. Total costs of operating farm motor vehicles were rising during 1946. Expenditures for fertilizer and lime also were above those of 1945, since both the amounts used and the prices had increased.

In addition, farmers in some parts of the country paid higher taxes for local government, the expenses of which have increased. On the other hand interest payments on farm mortgages declined slightly, in line with reductions by farmers in their mortgage debt. But because of these changes in production costs, the net income to farm operators increased slightly less than the gross farm income. Cash receipts from marketing, which constitute the greater part of the gross farm income, ran as much as 9 or 10 percent over 1945. The same percentage gain appeared in early estimates of the 1946 value of farm products consumed in farm households, so that American farmers' overall gross farm income—from sales, home consumption and government payments—was expected to show an increase of about 10 percent in 1946 as compared with 1945.

In dollars the cash receipts from farm marketings ran two billions above last year's 20.18 billions. Considerably more of the increase came from marketings of crops than from marketings of livestock and livestock products. Cash returns of crops marketed exceeded those of 1945 by as much as 16 percent, largely as a result of increased returns from wheat, feed crops, and cotton. Some increase took place in the receipts from livestock and livestock products. In this branch of agricultural marketings, meat animals and dairy products were chiefly responsible for the improvement. Government payments to farmers were slightly higher than those of 1945. In physical volume

the marketings were about the same as those of 1945. A higher volume of crop marketings was offset by a smaller volume in livestock and livestock products. Volume increases were notable in wheat and vegetables, while marketings of cattle and calves, of poultry and eggs, and of tobacco decreased.

**Agriculture a 100 Billion Dollar Industry.** As of January 1, 1946, agriculture could be classed as a 100 billion dollar industry. During the year 1945 the value of its total assets rose from about 91 billion dollars to nearly 102 billions. The combined value of farm real estate, crops, livestock, and farm and home equipment increased from approximately 75 billion to over 81 billion dollars between January 1, 1945, and January 1, 1946. During the same period farmers' financial assets such as currency, bank deposits, and Government bonds grew from an estimated 16 billion dollars to 20 billions.

Accompanying this upward trend during 1945 in the value of assets was a reduction in liabilities. Although it showed a smaller decrease than in the year previous, farm-mortgage debt declined to 5,081 million dollars, down nearly 4 percent for the year and down 23 percent since Jan. 1, 1940. Mortgage debt not only decreased less in total during 1945 than in previous war years, but in 20 States it actually increased. Non-real-estate debt owed by farmers to principal financing institutions (exclusive of loans guaranteed by the Commodity Credit Corporation) increased 3 percent, to 1,672 million dollars.

**Main Facts of the Year's Crops.** Some particulars of the year's record crop production deserve mention. Conditions in September, while not favorable in all localities, maintained or improved most crops. Corn matured with little frost damage and with good quality. Estimated production of nearly all crops exceeded earlier expectations with cotton an important exception. Cotton production dropped to the lowest level in 25 years. Estimated aggregate crop volume in September was 2.5 percent above the previous high of 1942, and 26.4 percent above the 1923-32 level.

Potatoes moved into the all-time record group along with corn, wheat, tobacco, peaches, pears, plums, and truck crops. Oats, rice, and peanuts came near to production records. Also in the near-record class were grapes, cherries, and sugarcane. Average or better crops were reported for hay, soybeans, dry peas, prunes, apricots, hops, sugar beets, flaxseed, sorghum grain, buckwheat, sweet potatoes, and apples. Below-average crops included rye, broomcorn, dry beans, and pecans. Oil crops group were lower than in 1945 despite improvement during the fall in the estimates for soybeans, flaxseed, and peanuts. Food grains and feed grains were at the highest aggregate production level on record.

Production of feed grains was about 127.5 million tons, 4 percent above the 1942 high. This total included 3,374 million bushels of corn, 1,527 million bushels of oats, 255 million bushels of barley and 88 million bushels of sorghum grain. Supplies per animal unit were the most liberal in our history, despite relatively small carryover stocks. The 97 million tons of hay, with a record-large carryover and large crops of rough forages, provided a liberal roughage supply. Pastures generally recovered from the low point of the season though not to the condition of a year earlier. Two large areas were exceptions, one embracing most of West Virginia, western Pennsylvania, northern Ohio, southern Michigan, and other areas along

lower Lake Michigan, and the other centering in the Ozark region. Range pastures improved. Winter prospects were favorable in former dry areas of the Southwest. Cattle and sheep made good gains in the areas of improved feed.

Production of food grains at 37.4 million tons topped that of any previous year. Added to the record winter wheat total of nearly 880 million bushels was a spring wheat crop of nearly 290 million bushels. Our total wheat crop of more than 1,169 million bushels was 46 million bushels larger than any previous crop. Estimated rice production of 70 million bushels was nearly a record and the 7.3 million bushels of buckwheat was above average. The 4 feed grains and 4 food grains amounted to about 165 million tons, about 10 million tons more than in 1942, previously the top total.

Sugar crop production was high though sugar beets declined slightly in September. Tobacco production was a new record at 2,248 million pounds, a quarter of a billion pounds more than the previous record total of 1945. Burley and flue-cured types established new records and every class was above its 1945 production. Broomcorn was above average.

Milk production per cow in September was the highest for the month in 22 years of record, for the seventh consecutive month. It reflected culling of the less efficient milkers and liberal feeding in response to rising prices. Egg production continued more than 20 percent above average.

The harvest of deciduous fruits was a record high. Continued improvement in the fall brought the total 19 percent above 1945 and 14 percent above average. Commercial apple production was about average; peaches, pears and plums were record crops; grapes and cherries were nearly records and prunes and apricots were above average. Growing conditions were favorable for new-crop citrus in all States, especially in Florida. Record citrus production was in prospect. Production of tree nuts was about 5 percent less than in 1945, but 22 percent above average. Record crops of almonds and filberts and a near record for walnuts were offset by a below-average crop of pecans.

Abundant supplies of fresh vegetables were in prospect. As the harvest of fall truck crops began, production for the year was expected to exceed that in any previous year. Production of late vegetables for processing was large. Green lima beans and green peas for canning and freezing were expected to exceed previous records, and the prospective aggregate supply of vegetables for processing was a third larger than average and only slightly below the record quantity produced in 1942. Total production of 21 kinds of grass, clover, and winter cover-crop seeds was approximately 494.6 million pounds of clean seed, compared with about 445.4 million pounds in 1945 and the 1940-44 average of 446.7 million pounds.

**World Food Production for 1946-47.** Food production throughout the world for 1946-47, according to reports received by the Department of Agriculture, will be larger than in the previous year though not up to the prewar average. Notably, the world's wheat crop will be larger. Favorable conditions in the Northern Hemisphere and also in the Southern Hemisphere, except in droughty parts of Australia, indicated the possibility of a wheat output nearly equal to the prewar average of 5.9 billion bushels or about 700 million bushels above the 1945-46 crop. Rye as a world crop promised to be larger than in 1945-46 though

below the prewar level; also, the world's rice production. Larger sugar production was in view. Expanding copra production in the Philippines and in the Netherlands East Indies was a partial offset to the serious world shortage of fats and oils. As mentioned, crop production in the United States continued at an all-time high. With livestock production here only a little below the war peak, it seemed the United States would continue to be the principal source of relief foods and commercial shipments in foreign trade.

Sharp reductions in carryovers left the world's total supply of food much below requirements, and only slightly above that of a year earlier. It was evident that food-deficit countries, though these accounted for much of the expected increase in output, would still need large food imports. Figures given with regard to the world's grain imports in 1946 sufficiently indicated the situation there. How the matter stands with fats and oils appeared during 1946 in an enormous difference between available export supplies and estimated requirements. Export supplies for the year amounted to only 2,500,000 tons. Average international trade in fats and oils before the war exceeded 5,000,000 tons. Though considerably less than that quantity would suffice in 1946-47 for the most urgent needs, it was not probable that anything like enough would be available even for that limited purpose. Moreover, stocks were perilously low in the United States.

In general, during 1946 conditions for agricultural production were better than a year earlier in North America, central Europe, and Russia. New crops eased the food situation somewhat in North Africa. Crop prospects were poor in southern China, and food supplies were unusually short in parts of China, and also in parts of India. In fact, unfavorable agricultural conditions prevailed over a great part of the Orient. Farm food production in Japan, where repatriation of nationals had greatly increased the population, was heavily down from the prewar level, and the country was desperately short of farm tools and fertilizer. Huge food deficits harassed the Philippines, where rice production was scarcely more than half the prewar average, and where serious shortages existed also in wheat, corn, dairy products, meat, and fish. Ordinarily, India and China obtain large quantities of rice from Burma, Indochina, and Siam. But these sources were largely unavailable, and the countries normally dependent on them looked instead toward the wheat countries for essential foods.

**Farm Rehabilitation Needs Abroad.** Farm rehabilitation needs were urgent in many countries. Machinery, other farm equipment, supplies of fertilizer, and even of seed were scanty. Feed supplies for livestock were very low; farm draft power was down in places as low as 60 percent below prewar. Much of the damage to agriculture, especially in central and western Europe, resulted directly from the war, and appeared in farms pitted with shell holes, sown with mines, or transformed into untillable wastes. The fighting also tore up roads, bridges, drainage works, and irrigation systems. Armies took away machinery, animals, food, feeds, and even seeds. Besides the damage it caused directly, the war disrupted transportation and processing facilities, paralyzed whole economic systems, and precipitated land redistributions and the other drastic social changes. It was evident that comparatively little of the rehabilitation job was a foreign responsibility, though UNRRA made considerable quantities of ma-

chinery, draft power, fertilizers, and seed available. Eventually, in some way, the handicapped agricultural industries would have to achieve their own rehabilitation.

Farm draft power of the UNRRA countries in Europe averaged only half of what it had been before the war. In the spring of 1946, out of the prewar 9,981,000 draft-power units, only 5,198,000, or 52 percent, remained. Moreover, the remaining units consisted mostly of worn-out tractors, and of lame, blind, diseased, or over-age animals. In Italy about two-thirds of the tractors were obsolete. In Oriental countries the draft-power shortage was less extreme; the estimated loss in China, for example, was 20 percent. Nevertheless, the Orient's shortage of draft animals and of machine power was critical because the traditional reliance there on human muscle was strained already to the breaking point. Moreover, men, women, and children when harnessed to implements often use up more food energy than their work can produce, so that farming by this method may ultimately increase the food shortage.

In most countries, both in Europe and in the Orient, tillage implements also are scarce. The destruction of farm tools and machines has about equalled the losses sustained in draft power. Thus even if human muscle could be substituted effectively for animal and engine power, it could not fully be put to work. Observers reported the use of it, nevertheless, even in once highly mechanized farm areas. In machinery shortage, Yugoslavia was typical. Yugoslavia lost 15,000 harvesting machines, and had only 10,000 left, most of which were in bad condition. In China, where the Japanese stripped every scrap of metal from the occupied areas, one-horse cultivators and walking plows were chiefly in demand.

All the war-torn countries desperately need repair shops and repair materials. One report said that in some European villages not even a hammer or an ax could be found. Lack of pumps and of piping prevented the use of many irrigation wells; lack of rubber hose for sprayers hampered the protection of crops from insects; lack of threshers threatened losses in harvesting. Lack of dairy processing equipment worsened the shortage of milk and milk products. Farm recovery in many countries awaited the provision of farm facilities, with hunger or dependence on relief-food imports, the only alternative.

**Rural Electrification in the United States.** An increasing demand for electric service was reflected in a record volume of loan applications submitted to the Rural Electrification Administration throughout 1946 by rural electric cooperatives and other REA borrowers. In response to this demand, Congress authorized \$300,000,000 of REA loans during the fiscal year ended June 30, 1946. With a lending authorization of \$250,000,000 for the fiscal year ending June 30, 1947, it appeared that REA loans during the first 2 years after the war would total about as much as had been contemplated for a 3-year postwar program and would exceed the total in the first 10 years of REA's existence.

Most of the application for REA loans came from rural electric cooperatives and other REA borrowers that were preparing to expand their electric systems in order to serve additional rural consumers in their areas. There was also substantial demand for service, however, in areas where no previous rural power systems existed. This was particularly true in North and South Dakota, Nebraska, and other sections of the Great Plains States.

During the fiscal year, REA approved loans totalling \$290,463,910 from 1946 funds. Estimates indicated that these loans would be sufficient to build a total of 183,916 miles of line serving 565,247 rural consumers in 45 States and Alaska. See separate article, **RURAL ELECTRIFICATION ADMINISTRATION**.

**Additional Crop Estimates.** In the near future, the Bureau of Agriculture Economics will make additional estimates of livestock slaughter and will further improve or extend its estimates relating to dairy products, poultry, farm prices, farm wage rates, feed supplies, and feed consumption. Already through the Production and Marketing Administration, the Department of Agriculture makes monthly estimates of livestock slaughter and meat production in federally inspected plants. BAE plans now to obtain information on farm slaughter from crop and livestock reporters. It will also collect facts from nonfederally-inspected plants. Together, these reports will give the Nation a picture of total livestock slaughter and meat output, month by month.

The commercial broiler industry has expanded its volume ninefold since 1934. The Bureau will keep abreast statistically with this development. It will also collect more information on prices received by farmers for beef cattle, apples, milk, and poultry products. It will investigate amounts paid for hired labor, report on farm labor employment customs, and record wage rates in areas that employ large numbers of seasonal workers.

Six new statistical divisions have been set up within the Bureau under the general supervision of an Assistant Chief. They will report on field-crop, fruit and vegetable, livestock and poultry, dairy, agriculture price, and special farm statistics.

**New Uses for Farm Products.** Chemists found additional ways in which farm products can be utilized in industry. Many widely used products can be made from milk casein, soybeans, sugarcane bagasse, oat hulls, corncoobs, straws, and other farm materials. Costs are sometimes high in comparison with the utilization of nonagricultural products. But this is not always true; moreover, as in other technology, the cost of utilizing farm materials in industry may decline. The Department of Agriculture's reports on the utilization of agricultural wastes and residues indicate that on balance agriculture is losing more markets to synthetic materials than it is likely to gain from the new industrial uses. Nevertheless, important possibilities exist in farm-product utilization, which should be developed. Technology is advancing and may alter the competitive situation. Science is finding additional uses for crops through controlled fermentation, chemical processing, and other ways, the importance of which will increase with continued drain on mineral resources. Solving the economic problems will involve marketing as well as production.

**Achievements in Plant Science.** A summing up on the value of new wheat varieties, distributed since World War I, shows they have added more than half a billion bushels to the Nation's bread material during the last four years, much of it in the hard spring wheat region, where stem rust has been very destructive. The newest wheat of this class, Cadet, distributed in 1946, resists stem and leaf rust and outyields other beardless varieties. There has been marked progress in developing new varieties for the hard red winter wheat region, where drought resistance is of primary importance. Establishment of the new Austin wheat in central and south Texas is reported by the cereal special-

ists as the first step in a program to eliminate the source of stem rust spores that have been carried by the wind each year with disastrous results in the great wheat areas to the North. The Austin variety, put out in cooperation with the Texas station in 1943, proved so popular, that 600,000 acres of it was harvested in 1946, a good crop itself and a great rust barrier.

Sugar-plant investigations resulted in outstanding recent improvements in sugarcane, and in sugar beets for the West and for the humid beet-growing areas. Two new sugarcane varieties for Louisiana and Florida were both adapted to machine harvesting and had many other advantages, including resistance to certain diseases. Another advantage to sugarcane growers, particularly in Louisiana, was the discovery that 2,4-D is effective in killing alligator weed and "tie-vines" and has no adverse effect on the cane plants. Johnson grass, the other big weed pest in canefields, is not much damaged by this treatment but tests show it can be controlled with repeated flammings.

Sugar-beet growers may now look forward to the day, probably not far off, when their crop yields will show the life of hybrid vigor. It has already been introduced, but strains are not yet available for commercial use. To be a success such strains must have the seed-producing convenience of one parent line that is male-sterile. The plant breeders already know they have available in their breeding material all the characters needed to provide the hybrids wanted. What might be called the onion trick (from the success of the California Hybrid Red Onion, based on male sterility), will be worked again for the sugar-beet farmers. The experimental hybrids already worked out have shown high disease resistance. They can outyield good commercials by two tons of beets and eleven percent sugar.

**Legislation for Agriculture Research.** Greatly broadened agricultural research was authorized under Public Law 733 (the Research and Marketing Act of 1946), which was signed by President Harry Truman on August 14. No funds were appropriated but a total of \$9,500,000 was authorized to be appropriated in the fiscal year 1947 for agricultural research and marketing services, with special emphasis on research regarding the utilization of farm products, the marketing and transportation of farm products, and agricultural production. Additional amounts were authorized for subsequent years. Principal objective of the legislation, as stated by its authors and sponsors, is to give agriculture parity with industry in the field of research.

The legislation specially emphasizes research and services to improve the marketing, handling, storage, processing, transportation, and distribution of agricultural products. An appropriation of \$2,500,000 is authorized to be made for 1947 to conduct the new research and service. Authorized annual increases would raise the amount to \$20,000,000 in 1951. These authorized funds are in addition to all other funds available for marketing activities.

Establishment of a National Advisory Committee of eleven members, six of whom are to be producer representatives, is provided for in the new measure. This Committee, to be named by the Secretary, will make recommendations regarding the research and service work and assist in obtaining the cooperation of affected groups and Federal and State agencies.

**Backward Marketing Facilities.** Keeping market facilities in step with farm production is a task with two main aspects, the relative importance of which

varies with technical and industrial developments. One aspect concerns the improvement of existing structures, equipment, and methods. Few cities in the United States have adequate facilities for unloading fruits and vegetables directly from railroad cars into the wholesale market; they must depend on truck hauls, frequently through heavy traffic. Even cities with good marketing facilities, and with close correspondence between their techniques of production and distribution, have some rebuilding to do.

The other big aspect of the problem is the provision of new shipping and receiving centers, processing and storing plants, slaughtering and refrigerating establishments, and other means of handling farm products in the modern way. In some areas of low production, low consumption, and undernourishment, practically everything required in marketing will have to be built from scratch. This is a chance to build well. Some new construction will be in order almost everywhere, side by side with vigorous well-planned improvement of existing market facilities.

It is important to recognize the distinction, and at the same time the interdependence, between market facilities and markets. Merely to improve the facilities will not create consumer purchasing power or raise the general standard of living. Production is the key to that—production by scientific means for adequate rewards. Obviously, however, the production cannot develop without means to distribute it; in fact, in many localities this is a main inhibition. For example, the production of milk for sale in the fluid form is impossible without efficient collection, speedy transportation, refrigeration, bottling, and daily deliveries. Good handling of meats and of fruits and vegetables requires sanitary and efficient processing, assembling, and distributing facilities. In the modern world production and marketing fuse into a single continuous operation, dependent for its efficiency on an approximately equal development of up-to-date techniques all along the line. Indeed, the marketing, from the consumers' standpoint, is part of the production job; it takes, transforms, preserves, and ships a tremendous output that otherwise would not appear or would be lost. It is the link between mass farm production and mass consumption, without which the farm production could not continue.

Extreme difficulty and complication attend the distribution of fruits and vegetables. This often is a weak spot in areas that do quite well with milk and meat. Studies in the United States of wholesaling and jobbing markets for fruits and vegetables reveal extensive need of improvement. In many cities the markets have undergone little change in fifty years, though in that period the production of fruits and vegetables has been literally revolutionized. Many markets do not fit the present situation. Their facilities have not kept pace with population-growth, with the rise of motor-transport, with crop-specialization in distant areas, and with changes in consumer demand. There is often much duplication of structures and equipment with useless splitting of business among points throughout a city. Unnecessary cross-hauling and spoilage result, the expense of market operation is excessive, and market-regulation breaks down. Communities that are just beginning to organize their distribution of fruits and vegetables have a chance to avoid such mistakes. In all cities, except the very largest, it can be an advantage to have only one wholesale market, since the wholesale market may be considered a natural monopoly.

Merely to list some things required in marketing

fruits and vegetables shows the formidable nature of the problem. One essential (in fresh-product handling) is easy access to regions of specialized production; it is impossible to rely on the chance offerings of occasional growers. Grading, boxing, and shipping make a trio of related tasks; products officially graded, uniformly boxed, and shipped in well-established ways have advantages over irregular or off-pattern shipments. Transport by fast freight or express adds to the marketability of the products. Systems for allocating supplies by areas, so as to obviate local gluts and shortages, add greatly to the cheapness and efficiency of fruit-and-vegetable marketing. Storage for out of season products and facilities for preserving fruits and vegetables are essential for year round provision of essential protective elements. Modern techniques of canning, drying, dehydrating, and freezing have enormously widened the space and lengthened the time in which the marketing may be done, and the markets for fresh, and for preserved products develop in a natural interdependence. In wholesaling and retailing, speed and sanitation rank high, and demand elaborate physical facilities.

As marketing develops, it may take an increasing proportion of the consumer's dollar. This proportion may vary considerably, moreover, from one kind of food to another and may seem especially high with highly processed foods such as crackers and canned fruits, or with perishable fruits and vegetables. But the proportions prove nothing by themselves; only close analysis can show their meaning. Distribution and processing necessarily cost more as the number of steps or processes increases. In a very primitive society, where consumption must follow quick upon production, distribution costs the consumer little because little distribution takes place. It may take quite a big slice out of the consumer's dollar in a complex economy based on specialized production and long-distance shipment; but there it may be worth its cost. Cutting the cost is always in order, but not an attitude which regards it automatically as extortion. The more reasonable course is to expect that distribution will run up a higher bill as it grows in scope, and to insist merely that the payment shall be for value received, as under the proper conditions it readily may.

**Consumer's Interest in Improved Facilities.** Heretofore, the demand for improvements in agricultural marketing has come chiefly from producers and traders, who have wanted higher prices, an increased volume of sales, or lower costs of distribution. Strengthened now with an awakened consumer interest, and pointed to the grand objective of better nutrition and higher living standards everywhere, the movement should set new goals for itself. It will find undoubtedly that the kind and volume of trade in view will require facilities far superior to those previously considered adequate, which from the standpoint of nutritional needs have left much to be desired. Fortunately, the work already done embodies principles strong enough to carry considerable new superstructure, especially in facilities for measuring variations in the quality of farm products and in expressing these gradations in a common trade language. The basis exists, in international as well as domestic trade, for fairer, wider, and less costly distribution, and also for greater cooperation in the marketing process among producers, traders, and consumers.

Programs for new construction and modernization of marketing facilities got off to a slower start in 1946 than had been expected. There were difficulties in bringing together newly released mate-

rials, and in assembling skilled labor. Plans, which toward the end of the year got out of the blueprint stage, contemplated expenditures of hundreds of millions. Food trades projected large additional construction, such as numerous streamlined wholesale plants with extensive refrigeration and storage equipment to care for the expected increase in frozen foods. New retail-store construction, mostly by established enterprises, promised to carry the total to 400,000 buildings. Manufacturers of food-processing equipment expected to acquire and modernize plants previously devoted to war work. Among other items, such manufacturers had orders for more than \$600,000,000 worth of grocery manufacturing equipment. Notably, the reconversion of dairy processing raised problems in the construction, location, equipment, and utilization of processing facilities.

Processors of fruits and vegetables faced new conditions in 1946. Government requirements, though substantial, declined, especially for dehydrated products. Most fruit and vegetable dehydrators ceased dehydration operations. Citrus concentrate plants had less business than in the war years but had opportunities for expanded production of straight juices. Canners ran into increased competition from quick-frozen foods, output of which was threefold greater than before the war. Bottlenecks in food packaging were far less troublesome than in 1945, though restrictions on the use of tin plate were in force. Manufacture of cans by the electrolytic method, which makes a given amount of tin go further, was a legacy of wartime experience. Facilities for livestock slaughtering and marketing were generally adequate, but shortages of motor trucks hampered shipments of livestock.

**School Lunch Program.** The National School Lunch Act, approved June 4, 1946, established a permanent basis for the program administered by the U.S. Dept. of Agriculture since 1935. Participation in the school lunch program during the school year 1946-47 will probably include some 8.6 million children in 48,000 schools. School lunches in the 1945-46 school year benefited 7 million children in 44,000 schools. The new Act authorizes appropriations to the Department of Agriculture to assist States in "the establishment, maintenance, operation, and expansion of nonprofit school lunch programs." The money will be given as grants-in-aid to States to repay schools for food purchases, etc.

Funds authorized for equipment are limited to \$10,000,000 annually; funds for school lunch food, however, will vary from year to year with requirements. Apportionment among the States will be in line with numbers of school children between 5 to 17, and with per capita State incomes. Federal funds if accepted must be matched, dollar for dollar, by State funds until 1951. Thereafter, until 1955, the State contribution must be increased to \$1.50 for every Federal dollar. After 1955, the State must provide three times the Federal contribution. In a State whose per capita income is less than that of the United States, however, the matching required for a fiscal year may be decreased by the percentage of difference between the State's per capita income and that of the United States.

Assistance may be given to nonprofit private schools that meet eligibility requirements, as well as to public schools. In most cases, the Federal funds for both types of school will flow through State educational agencies. In States not legally authorized to disburse contributions to private schools, the State offices of the Production and Marketing Administration will handle the contracts.

The eligibility requirements are the same as those observed during the last three years. Schools that accept Federal assistance must serve a lunch suited to the nutritional needs of growing children; reimbursement at the highest rate will be for the complete meal known as the Type A. Lunches must be available to all children without discrimination, regardless of their ability to pay. Schools must keep records, so that compliance with the provisions of the Act may be determined.

This legislation has a two-fold declared purpose: (1) To safeguard the health and well-being of our Nation's children, and (2) to encourage the domestic consumption of nutritious agricultural commodities and other food. In this respect it follows the principle emphasized previously in the school lunch programs. In prewar years, under Section 32 of Public Law 320, 74th Congress, foods purchased by the Dept. of Agriculture to alleviate market conditions were sent to State welfare agencies for use in school lunch programs. During the war, when food surpluses almost disappeared, a reimbursement plan was widely used instead, whereby school lunch operators received money to cover part of their food costs.

The new program will emphasize the use of the more abundant foods. Whenever market conditions are such that the Department must purchase quantities of certain foods, it will offer such foods to schools for the lunch program. It will assist schools in making an efficient use of the foods provided, and in improving the school lunch program as a whole.

ARTHUR P. CHEW.

**AGRICULTURE, U.S. Department of.** A Department of the U.S. Government, created by Act of Congress, May 15, 1862, and directed by law to acquire and diffuse useful information on agricultural subjects in the most general and comprehensive sense. The Department performs functions relating to research, education, conservation, marketing, regulatory work, and agricultural adjustment. It conducts research in agricultural and industrial chemistry, the industrial uses of farm products, entomology, soils, agricultural engineering, agricultural economics, marketing, crop and livestock production, production and manufacture of dairy products, human nutrition, home economics, and conservation. It makes research results available for practical farm application through extension and experiment station work in cooperation with the States.

The Department provides crop reports, commodity standards, Federal meat inspection service, and other marketing services. It seeks to eradicate and control plant and animal diseases and pests. It administers more than 50 regulatory laws designed to protect the farmer and consuming public, and enforces the Sugar Act of 1937 and the Commodity Exchange Act, June 15, 1936. It promotes the efficient use of soils and forests. It provides rural rehabilitation, and guarantees farmers a fair price and a stable market through commodity loans and marketing quotas. It also provides agricultural credit, assists tenants to become farm owners, and facilitates the introduction of electric service to persons in rural areas.

**Changes During War Years.** Early in the war period the Department of Agriculture functioned as a food administration though without any formal order. On December 5, 1942, President Roosevelt by an executive order made it officially responsible. This order, which announced a reorganization of the Department, placed all Department agencies concerned with food production under a Director

of Food Production and grouped all department agencies concerned with food processing, storage, allocation, and distribution under a Director of Food Distribution. In March, 1945, by another executive order, this arrangement gave place to a new delineation of wartime food responsibilities. Parts of the existing food production and food distribution administrations became the War Food Administration, which managed the war food job until June 30, 1945, when by its own request the President abolished it and merged its functions with those of the Department of Agriculture.

Subsequently the Secretary of Agriculture, Clinton P. Anderson, announced the appointment of a Committee on Departmental Reorganization. On the advice of this committee the Secretary announced the establishment of a Production and Marketing Administration which was, in effect, a consolidation of the following agencies: Office of Basic Commodities, Office of Supply, Office of the President of the Commodity Credit Corporation, Offices of the Manager and of the Secretary of the Federal Crop Insurance Corporation, Office of Marketing Services, Agricultural Adjustment Agency, Office of Requirements and Allocations, Office of Price, Office of Transportation, Office of Materials and Facilities, Office of Labor, Office of Home Food Supply, Office of Investigatory Services, and the liquidating Federal Surplus Commodities Corporation.

Principal agencies of the Department include the following: The Agricultural Research Administration, which directs and supervises most of the scientific research activities of the Department. Agencies which report to ARA include: the Bureau of Agricultural and Industrial Chemistry, the Bureau of Animal Industry, the Bureau of Dairy Industry, the Bureau of Entomology and Plant Quarantine, the Bureau of Human Nutrition and Home Economics, the Bureau of Plant Industry, Soils, and Agricultural Engineering, the Office of Experiment Stations, and the Agricultural Research Center of Beltsville, Maryland.

Other important agencies of the Department are: the Extension Service which cooperates with State agricultural agencies in education programs; the Farm Credit Administration, organized to provide a complete credit service for farmers and farmer cooperative associations; the Farm Security Administration, which makes loans and gives technical supervision to family-type farmers unable to get sufficient credit elsewhere; the Forest Service; the Rural Electrification Administration; the Soil Conservation Service; the Bureau of Agricultural Economics; and the Office of Foreign Agricultural Relations.

**Legislative Basis of Action Agencies.** In 1929 the Agricultural Marketing Act was passed, followed by the establishment of the Farm Board. The Foreign Agricultural Service Act was enacted in 1930. Enactment of the Agricultural Adjustment Act May 12, 1933, resulted in the setting up of many "action agencies" in the Department. This act was designed to establish and maintain such balance between the production and consumption of agricultural commodities, and such marketing conditions therefor, as would reestablish prices to farmers at a level that would give farm products the purchasing power they had in specified earlier base periods. The base period for most commodities was 1909 to 1914.

Subsequent legislative acts authorized other parts of the Department's action program. These measurements included: the Emergency Farm Mortgage Act of 1933; the Farm Credit Act of

1933; the Federal Farm Mortgage Corporation Act and the Jones-Costigan Sugar Act of 1934; the Soil Conservation Act of 1935; the Soil Conservation and Domestic Allotment Act, the Rural Electrification Act, and the Flood Control Act of 1936; the Agricultural Marketing Agreement legislation; the act placing functions of the Federal Surplus Commodities Corporation in the Department; the Bankhead-Jones Farm Tenant Act; the Norris-Doxey farm forestry legislation; the Pope-Jones water-facilities legislation; and the Sugar Act of 1937; the marketing-agreements and surplus-diversion programs, authorized in 1937-38; and the Flood Control Act, the Agricultural Adjustment Act, and the Federal Crop Insurance Act of 1938.

**Famine Program.** Secretary's Memorandum 1156, March 19, 1946, established an Office of Emergency Food Program in the Office of the Secretary to coordinate and give general direction to all phases of the program, and to assist the Secretary in providing food for relief shipment abroad. On April 9, Herbert Hoover reported to the Famine Emergency Committee on European food needs and the next day the Secretary issued a call for world aid in the food fats and oils crisis.

Secretary's Memorandum 1158, April 10, 1946, provided for coordination of relationships between the Department and the Food and Agriculture Organization of the United Nations.

The Famine Emergency Committee made recommendations for intensification of the food-for-famine program in a letter to the President dated April 17, 1946. On April 19, the Secretary announced a 6-point program to speed up and increase food-grain shipments urgently needed to avert famine abroad. Still other grain conservation and famine relief measures were quickly taken. The Government's grain price policy was announced May 8, the wheat program May 14.

ARTHUR P. CHEW.

**AIR CONDITIONING AND REFRIGERATION.** The Air Conditioning and Refrigeration Manufacturers Association, following a study of industrial development in the South, predicted that the increasing use of air conditioning is playing a large part in making such development possible, as it places the South in climatic equality with Northern industry.

Technical details on the air conditioning of 4½ miles of London subway during wartime were released during 1946. The subway was used for manufacturing purposes with the machines placed side by side, and with a track for narrow gage cars running back of the operators. It was necessary to air condition the subway to make such use possible. Approximately three million cubic feet of space were conditioned.

A new refrigeration code was adopted by Detroit in June. Later, the Wisconsin State Industrial Commission held a series of meetings to study a proposed new State refrigerating plant code. A Los Angeles refrigerating code was completed in the summer. Additional regulations were set up governing the use of new Freon refrigerants in New York City.

Indications later in the year were that a committee representing the frozen food industry and various consumer groups would be appointed to draw up minimum standards to restore prewar quality in the industry. Frozen foods reduced raw food costs to \$.90 per crew member, from \$1.35, according to a study made on ten ships of one shipping company. The prediction was made in November that one billion pounds of frozen foods will be produced in 1947.

The U.S. Department of Agriculture and the Ohio Experiment Station announced exceedingly high germination from seeds kept in cold storage for five years, promising security and money economy in the safeguarding of seed growth.

Further headway was made in the refrigeration of cutting oils used on machine tools. Control of the cutting oil temperatures helps maintain tolerances, increased tool life and the possibility of performing rapidly the roughing operations. Mechanical refrigeration is being used on automobile assembly lines. Steel valve inserts are shrunk by refrigeration and then are permanently fitted into cylinder blocks. Chilling to 120 degrees below zero reduces each insert .002 of an inch in size.

A study of German air conditioning and refrigeration made by the U.S. Army revealed that that country's industry was from five to ten years behind that in this country.

Air conditioning in varying degrees is being provided in new passenger ships being built by Bethlehem Steel for the American President Lines. They will have the largest air conditioning plant ever installed on board a ship. Three new 18,000-ton Delta Line passenger liners under construction in Mississippi were also air conditioned in 1946. The 17,000-ton heavy cruiser *Salem*, now being built at Quincy, will be one of the U.S. Navy's first fully air conditioned warships. The air conditioning is not to molly-coddle the personnel, the Navy reported, but to increase fighting efficiency and improve living conditions. In June, the Commander of the Eastern Seafront of the U.S. Navy, revealed plans for sealing and dehydrating with dehumidification equipment, 1,125 ships of the 16th Fleet and 1,079 units of the 19th Fleet against future use. The dehumidifying will prevent the ships from rusting while idle. Air conditioning was applied to the Lockheed *Constellation*, a pressurized transport plane; refrigeration was necessary to overcome the heat generated inside the cabin including that from occupants, and also to offset the heat resulting from friction of the plane against the air, resulting from the high speeds.

Two types of air conditioned buses, one for city service, and one for intercity trips, were built by Brill Motors Company during the year; 100 of the former type were built for San Antonio Transit Company. One hundred additional air conditioned trolley cars were ordered by Georgia Power Company following study of an experimental car during the past year. The new design calls for about one half the weight of the experimental equipment.

A new railway passenger coach with full air conditioning was shown in September by Pullman Standard Car Manufacturing Company. Each car system is complete in itself, operated independently of outside power or control. Electricity is furnished by a direct-current generator driven by a power take-off from the car axles. An aluminum refrigerator car built by the Illinois Central is 25 percent lighter than ordinary iced cars due to generous use of aluminum and glass. An electronic air filter designed especially for railroad car applications was placed on the market during the year.

See HEATING AND VENTILATION.

CLIFFORD STROCK.

**ALASKA.** The territory of Alaska lies in the far northwest corner of the North American continent and includes the Aleutian Islands which extend westward more than 1,200 miles toward the Kamchatka Peninsula. The area of Alaska, inclusive of inland waters, is approximately 586,400 square miles or approximately one-fifth the area of conti-

mental United States. Three-fourths of Alaska is in the North Temperate Zone.

**Population.** According to the 1940 census the population of Alaska was 72,524 of which whites numbered 40,086 and natives (Indians and Eskimos) 32,458. Eskimos accounted for 15,576, Indians for 11,283 and Aleuts for 5,599. The population of Alaska in 1945, excluding members of the armed forces, was estimated at 85,000. Juneau, the capital of Alaska, had a population of 5,729 in 1940.

**Government and Political Status.** Although Alaska was purchased from Russia in 1867 for \$7,200,000 it did not become an "incorporated Territory" until 1912 when Congress passed an "Organic Act" creating the Territory of Alaska. Under its terms the Territory does not merely belong to the United States, but is a part thereof. The Constitution and laws of the United States are automatically in force with the exception of certain provisions which are clearly not applicable. The head of the Territorial Government is Governor Ernest Gruening who was appointed by the late President, F. D. Roosevelt in 1939 for a four-year term, which has since been renewed. In addition, there is a Territorial Legislature which meets for a period of 60 days biennially beginning with the fourth Monday in January of uneven years. Commencing with the 1945 session the number of members in this body has been increased to include 16 senators and 24 representatives. A delegate (Edward L. Bartlett) is elected by Alaskans every two years to represent Alaska in the U.S. Congress. He is empowered to prepare and introduce legislation, and act as a member of Committees, even though he has no vote. The administration and supervision of such functions as health, welfare, education of natives, expenses of the legislature, and judiciary, has not been delegated to the local government, but has remained a Federal function. There are as many as 50 Federal agencies participating in the management of Alaska's affairs.

**Events, 1946.** Though President Truman, in his annual budget report on January 22, urged Congress to admit Alaska to the Union as a state, no action was taken during 1946.

The Alaska Highway from Dawson Creek, British Columbia, to Alaska, which had been built during the war at a cost of \$138,000,000, came under the scrutiny of the Congressional House Roads Committee for determination as to whether any fraud or corruption was attached to its construction. After a four-month investigation, the Committee reported on March 20 that the highway was constructed as economically as could be expected and was free from any fraud. On April 3 Canada formally took over the administration of the Highway and opened it to restricted civilian traffic during October. Hotels, food stores, and gasoline stations were under construction along the Highway to accommodate an expected tourist "boom."

Late in July the United States Department of the Interior drafted a comprehensive program "for the development of Alaska's vast economic potentialities." Designed to support many times the Territory's 85,000 population, the program sought to encourage new business, industry, and agriculture. Secretary of the Interior Julius A. Krug announced he would make a ten-day inspection tour of Alaska in August to set up means for the implementation of the new program. Accompanied by key officials of the Department's agencies concerned with Alaskan affairs, Mr. King said he would discuss with local business, governmental, and labor leaders the following subjects:

1. A program of complete and reliable information relative to Alaska's position and prospects; early settlement of questions concerning the availability of public lands, and a campaign to induce business interests to invest capital in the Territory.

2. Making the Territory a full partner in effecting the program, with a greater measure of self-government.

3. The establishment of a Reconstruction Finance office to make small business loans and aid in the industrial development; expansion of road construction, rehabilitation of the Alaska Railroad, and the construction of more power projects.

4. Development of the tourist industry by making public lands available along the Alaska Highway and encouragement of private investment in the tourist industry.

5. Agricultural development through a farming program with the Department of Agriculture and the establishment of an Alaskan Research Administration to advise on farming lands and marketing conditions.

6. A public works program for the expansion of schools, hospitals, water systems, sewage disposal systems, and small boat harbors.

7. Improvement of the Government's administrative services.

The native population of Alaska faced rapid extermination, Army surgeons and American Red Cross officials claimed in September, unless strong corrective measures were taken to eliminate tuberculosis. Estimating that 40 percent of the population was tubercular and that only 15 percent reach the age of forty, the officials said that the condition was also endangering the health of the white population in Alaska. The high incidence of the disease was attributed to unhygienic living conditions, poor diet, and a lack of medical service. Treatment of persons in isolated communities was made extremely difficult by bad communication and transportation facilities.

The United States West Coast shipping strike that began in early September, created a critical shortage of food in Alaska. Small quantities of food and medical supplies were carried to Alaska by trucks and airplanes, but these shipments provided only a minute portion of the Territory's needs. One relief ship with 3,900 tons of foodstuffs was permitted to leave Seattle on November 21, but an additional 2,000 tons were needed for the communities of southwestern Alaska alone. By the beginning of December, when the strike ended, shippers promised the immediate dispatch of two relief vessels from Portland, Oregon.

In mid-December the United States Department of the Interior disclosed that it had undertaken a geological search in Alaska to determine whether any sources of uranium existed. In addition, an intensive survey of the Territory's oil, coal, gold, and radium potentialities were in process. Most vital, however, were the experiments conducted with permafrost, the permanently frozen ground which underlies Alaska. Ignorance of permafrost cost the United States millions of dollars during the war in the maintenance of the Canol pipe line and Alaska Highway.

**Education.** Alaska has two school systems, one for white children and those of mixed blood, called the Territorial Schools, and the other for natives (Indians and Eskimos) known as the Native Schools. In the case of the former the Territory has full responsibility for the control, administration, and financing of education whereas in the latter the Federal Government, through the Office of In-

dian Affairs, assumes the educational burden. The University of Alaska, founded in 1922, had a total of 1,020 students enrolled in 1944-45. There were 11,182 students enrolled in the primary and secondary schools during 1945.

**The Economy.** The leading industries of Alaska in order of their importance are fishing, mining, and fur farming. The value of manufactured fishery products in 1944 was \$63,260,100. Salmon fishing and packing account for 80 percent of the people employed in Alaska. The normal annual salmon pack for Alaska runs 6,000,000 cases (of 48 one-lb. cans). Alaska alone accounts for 60 percent of the world's supply of salmon. There are 93 canneries devoted to this industry and they employ 24,665 laborers. The center of the salmon industry is Ketchikan. Other fish caught in Alaskan waters and marketed commercially are herring, halibut, crabs, etc.

Mining which ranks second in importance as an industry has been seriously curtailed during World War II. The output of mineral resources during 1944 was \$7,032,000. Gold, the leading mineral export, ranks second to salmon exports, but in 1943 gold mining was seriously curtailed and only \$3,485,405 produced in contrast with \$17,000,000 (1942) and \$24,000,000 (1941). Other minerals mined in Alaska include coal, mercury, silver, copper, lead, and platinum.

Alaska's third leading industry is fur farming and the sale of furs derived from trapping. The production of furs during 1944 amounted to \$2,268,658. Mink pelts and sealskins are the two leading products. The Pribilof Islands account for 85 percent of the world's supply of sealskins.

**Commerce and Foreign Trade.** The total commerce between the United States and Alaska since 1867 has been estimated to exceed \$3,400,000,000, with minerals accounting for approximately \$830,000,000. Exports of Alaskan products to the United States from 1942 to 1944 totaled \$56,000,000, \$70,000,000, and \$68,000,000 respectively. Canned salmon accounted for \$46,000,000, \$52,000,000, and \$50,000,000 or 76 percent of the total export trade. Other fresh or frozen fish products, such as halibut, salmon, cod, and herring, accounted for approximately 14 percent, with furs and skins and gold bullion accounting for the greater portion of the remaining 10 percent. Imports from the United States by Alaska totaled \$89,000,000, \$74,000,000 and \$64,000,000, respectively. The principal imports were vegetable food products beverages, machinery, vehicles, metals, and manufactured goods.

**Agriculture.** The three principal farming areas in Alaska are located in the Kenai Peninsula (Homer Area), Tanana Valley (near Fairbanks), and the Matanuska Colony (near Palmer). The products grown are largely for local consumption, i.e. grains, vegetables, foodstuffs, livestock, dairying, poultry, and hog raising. All crops common to North America also thrive except corn, tomatoes, and orchard fruits. One of the most interesting experiments in agricultural colonization ever undertaken under Government sponsorship is the Matanuska Valley Colonization Project, fifty miles from Anchorage at the head of Cook Inlet. Of the 200 families who in May, 1935, migrated from Minnesota, Wisconsin, and Michigan only 58 remained throughout the initial period of hard toil and little return. To date approximately 7,000 acres have been cleared under trying conditions, but there have been good results for potatoes, lettuce, cabbage, etc., which are moved to Alaskan cities in carloads. The U.S. Army, particularly Fort Richardson which is located at Anchorage, purchased \$750,000 in

produce from Alaskan farmers during 1943. The growing season in Alaska lasts for about 115 days.

**Livestock.** Reindeer outnumber all other types of livestock raised in Alaska. In 1944, there were 170,000 head of reindeer of which two-thirds were owned by Indians and Eskimos. This industry is administered by the Office of Indian Affairs, in the Department of the Interior, primarily for the benefit of Alaska's natives. Other livestock include horses, cattle, hogs, and poultry.

JOSEPH P. BLANK.

**ALBANIA.** A Balkan country on the east shore of the Adriatic Sea. Area: 10,629 square miles. Population: 1,063,000 (Jan. 1, 1940). Chief towns: Tirana (capital), 30,806 inhabitants in 1930; Scutari (Shkodër), 29,209; Koritsa (Korçë), 22,787; Elbasan, 13,796; Durazzo (Durrës), the chief port, 8,739.

**Education and Religion.** Primary education is nominally compulsory, but illiteracy remains high. The population, by religions, included 688,220 Moslems, 210,313 Orthodox Christians, and 104,184 Roman Catholics.

**Government.** The dominant party in Albania is the National Liberation Front, led by General Enver Hoxha, who was Premier of the Provisional Government. The Governments of Great Britain, the United States and the U.S.S.R. recognized the Provisional Government on November 10, 1945. On January 12, 1946, the Constituent Assembly proclaimed Albania a Republic.

**Events.** In 1946 the Albanian regime transformed itself from a provisional to a constitutional government, taking on the complexion of a socialist state. Internationally, its relations with Russia, and the states friendly to Russia, have grown more intimate, and those with Great Britain have deteriorated almost to the point of open hostility. With Greece, whose orientation is towards Great Britain, relations have also been strained because of vigorous Greek claims to Southern Albania (called Northern Epirus by the Greeks), and border incidents have been alleged on both sides. Greek claims on Albania have not, however, been supported by Great Britain. The United States has generally followed British policy in regard to Albania, though it has had no incidents to complain of as have the British. On the other hand, the United States Senate has passed a resolution supporting Greek claims against Albania.

The Albanian Constituent Assembly, which had been elected on December 2, 1945, met in Tirana on January 10, 1946 and proclaimed the People's Republic of Albania. It enacted a law creating a Presidium clothed with very full powers, its composition being almost identical with the directorate of the Albanian Anti-Fascist National Liberation Council. Omer Nishani was named president of the Presidium; the other members were Koci Xoxe, Myslim Peza, Nako Spiru, Sami Baholli, Enver Hoxha, Hasan Pulo, Sejfullah Maleshova, Medar Stylla, and Manol Konomi. The Presidium approved all laws passed by the provisional government. Enver Hoxha, head of that government, resigned on January 13, and was promptly reinstated as Prime Minister. A draft constitution, similar to Yugoslavia's, was drawn up and publicized through the press and mass meetings; suggestions were solicited to make the people feel themselves participants. Freedom of press, speech, assembly, and religion was guaranteed. Military training was made compulsory, and education put under state control. Natural resources were nationalized. The right of asylum was vouchsafed foreigners "persecuted for

activities in favor of democracy, national liberation, and the struggle for the rights of the working classes." All citizens were declared equal, regardless of birth, social position, religion, or sex; all, over eighteen, were given the franchise. National minorities were given equal rights, and might follow their own language and cultural development. Inviolability of the person was guaranteed: "No one may be taken into custody for more than three days without decision by a tribunal or a public prosecutor." Church and state were separated, in order to abolish "the possibility of speculating with the religious feelings of the masses and cheating them in favor of the ruling classes." But religious communities retained freedom of "faith and rites." Marriages must be celebrated by the state, but couples might have religious ceremonies as well. Illegitimate children would have the same rights, and their parents the same responsibilities, as legitimate. Subsurface natural resources, forests, rivers, banks, air and postal communications, and broadcasting stations were declared "the common property of the people." Foreign trade was put under state control. "Private property and initiative in the economic life of the country are guaranteed insofar as they do not endanger the collective interests." The right of inheritance was assured, but inherited private property might be limited or expropriated when "the general interest of the country demands." Land was to belong to those who till it; "large estates can under no circumstances remain in private hands." Workers would be compensated according to the work performed and their ability; they were to be paid "by society as much as they contribute." But it was plain that the Government would put its own construction upon some of these provisions. In regard to freedom of press, speech, and assembly, Professor Seifullah Maleshova, the (Communist) Minister of Propaganda, declared they could exist in Albania only within the framework of "the new democracy." On March 14 the new constitution was unanimously adopted by the Albanian Constituent Assembly, which thereupon renamed itself the People's Forum of the People's Republic of Albania. Hoxha immediately resigned, and was commissioned to form a new government. All the members of the new government were Communists, Hoxha himself retaining the portfolios of defense and foreign affairs as well as the premiership.

Though members of the Government charged that the British or the Catholic Church continued attempts to encourage a "fascist" opposition, the Government's measures met with no apparent opposition, but seemed to be generally well received. Among the first measures was the seizure of fluid Italian assets in Albania and the expulsion of the Italian mission headed by Ugo Turcato (for which AFHQ had given permission) on the grounds that Turcato was encouraging a separatist trend; the confiscation and nationalization of Albanian-owned mines; the encouragement of cooperatives; and the perpetual banishment of ex-King Zog. Zog, who had been in England since 1940, convinced that the Hoxha regime was temporary, went to Cairo in February, probably in order to reorganize the opposition. The Government organ *Bashkimi* openly charged British connivance in this project. On January 28 the Directorate of National Defense issued a communique, signed by Hoxha as Commander-in-Chief, announcing the arrest of leaders of the "Albanian Alliance," who were exposed as "fascist terrorists" who had cooperated with the British in efforts to overthrow the regime. A vigorous campaign was waged against the Catholic clergy, who

were accused of having been founders and leaders of the "fascist and terrorist" *Bashkimi Shqiptetar* (Albanian Union). Editorials against Catholics, especially Jesuits, appeared in *Bashkimi*. Open action was taken against Father Anton Harapi, who had been a member of the collaborationist Government during the war; before the elections the Government had refrained from such action. Frana Ma Gjini, Regent of the Apostolic Delegation in Albania, addressed a memorandum to Hoxha enumerating the Church's grievances, complaining that it was unjustly maligned as fascist, and demanding free action for it. Hoxha replied that the Church was "still justifying collaboration," and proceeded with the arrest and trial of clergymen on charges of collaboration. It is not likely that Catholic dissatisfaction will be a considerable factor within the country, in view of the attitude of the Mohammedan and Orthodox groups. The Orthodox comprise some 20 percent of the population, and are the most advanced culturally, economically, and politically. They reside mostly in the south, where the National Liberation Movement began, and several leaders of Hoxha's Government are Orthodox. They are in general staunch nationalists, and do not favor annexation to Greece.

On January 28 the Security Council of the United Nations shelved Albania's request for membership. The request had been sponsored by Russia and Yugoslavia and opposed by Great Britain and Greece. In a speech on foreign policy to the People's Forum on March 24 Hoxha expressed disappointment at the rejection. He declared that Albania wished to be the chattel of no great power but truly independent. It wished to maintain friendly relations with all, but especially with Russia, Yugoslavia, and Bulgaria; its relations with Great Britain were not good.

Manifestations of friendship for Russia and its protégés have been continuous and well publicized. Government propaganda proclaims that the Soviets saved the world from Nazism and made the greatest contribution to the war effort, and that the current regimes in Yugoslavia and Bulgaria have effected great and beneficial political and economic reforms. Tito is represented as the savior of the Balkan masses, Stalin as the world's greatest man. Older people are not much influenced by this line, but the Partisans and the youth are much impressed; perhaps Zog's repressive measures had been directed chiefly at liberal and youth groups. Whereas British and Americans have been placed under restrictions, representatives of Russia and Yugoslavia are allowed freedom of movement and special privileges; they alone, for example, were allowed to visit the Kucova oil fields. Albanian army, youth, and economic delegations were received in Moscow, and Albanians enrolled in Russian institutions for military and other education. Russia has supplied Albania with a quantity of grain and munitions. Relations with Yugoslavia have also been fostered. Each country has emphasized the mutual cultural and economic ties. Yugoslavia is the only country to which substantial Albanian exports—petrol, wool, hides, and tobacco—can be directed, in return for grain and perhaps weapons. Yugoslav medical and technical missions have been sent to Albania. A Society for Cultural Collaboration between Yugoslavia and Albania has been formed at Tirana, to promote lectures and publications. There has been a special effort to popularize Tito personally, though many Albanians are suspicious of Tito's intentions towards Albania and compare him to Mussolini. Bulgaria and Czechoslovakia have also received Albanian trade,

cultural, and youth missions; and Czech technicians, probably for mining, have gone to Albania.

The regime's Communist orientation, the demands leveled against it by Britain's protégé Greece, and the virtual Allied blockade since liberation in December 1944 have exacerbated distrust of Great Britain and the United States. Albanian suspicions began in November 1943, when British agents cooperated with the (collaborationist) Balli Kombetar, and Brigadier Hodgson, chief of the British Military Mission submitted unfavorable reports on the Partisans. On April 4, 1946, relations deteriorated to the point where Great Britain declared that due to "the increasingly difficult attitude" adopted by Albania it would not send to Tirana its Minister designate, Thomas Cecil Rapp, nor receive an Albanian envoy in London. Specific complaints were that obstacles were being put in the way of the British Military Mission and of Major McIntosh, the British War Graves Commissioner, and that permission had been denied to Major W. V. G. Smith to come as Rapp's Military Adviser. Resumption of diplomatic relations was delayed when, on May 15, Albanian coastal batteries of the port of Saranda fired on two British warships passing through the Corfu channel. The British found the response to their first note unsatisfactory and delivered a second protest demanding punishment of the Albanian officer responsible, and assurances that similar instances would not recur. On October 22 two British destroyers struck mines, which caused a number of casualties among personnel, in Saranda Bay. On November 1 Albanian shore batteries inflicted a direct hit upon the superstructure of a British cruiser in the same waters. On the incident of October 22, the Albanian Government lodged a complaint with the United Nations, charging that it constituted a "flagrant violation" of Albania's integrity for the purpose of creating "incidents." The Albanians also charged that British planes had flown low over Albanian territory "with the objective of intimidating and provoking." The British Foreign Office pointed out that although the channel in question is within the Albanian three mile limit, it is recognized as an "international channel," through which warships may pass in "innocent passage." Simultaneously with their complaint of British violations the Albanians protested that Greek troops had violated Albanian territory on October 21, in disregard of protests over previous violations, especially those of July 5 and 7.

On November 11 and 14 Albania protested to the United Nations against repeated violations of its territorial waters by "large numbers" of British warships "under pretext of sweeping for mines." British Foreign Office spokesmen professed surprise at Albania's protest against the "humanitarian" enterprise of minesweeping. On November 5 the United States Department of State notified Premier Hoxha that it would withdraw its representatives from Tirana; and these representatives were in fact evacuated by American destroyers on November 14. In a note to the United States on November 14 Hoxha protested this action as unfriendly to Albania and unmerited by her. Moscow and Belgrade press and radio publicized this note, and spoke of Anglo-American "imperialist pressure" to hinder the development of "democratic" institutions in Albania.

**Production, etc.** Albania's chief products are corn, wheat, tobacco, olive oil, wool, petroleum, timber, hides, dairy products, and fish. There are deposits, still largely unexplored, of copper, chrome, and other minerals.

**Transportation.** The highway network extended 1,759 miles in 1940 (750 miles suitable for motor traffic), but this was badly disrupted by war in 1940-41. Construction of a railway between Durazzo and Elbasan, the first line in Albania, was begun in May, 1940.

MOSES HADAS.

**ALIEN PROPERTY CUSTODIAN.** Office of. A war agency within the Office for Emergency Management, established by executive order of Mar. 11, 1942. The Alien Property Custodian has the power to direct, manage, supervise, control, or vest property of nationals of enemy or enemy-occupied countries.

The Office has taken title to more than 44,000 patents and patent applications formerly owned by nationals of enemy countries and enemy-occupied territories. The liquidation of vested property, except patents, is being effected through a program of public sales. The patents are being licensed to American industry, as applications are received, on a nonexclusive, royalty-free basis for the life of the patent. Alien Property Custodian: James E. Markham.

**ALSACE-LORRAINE.** The two border provinces annexed by Germany after the Franco-Prussian War and returned to France by the Versailles Treaty (June 29, 1919). They were reoccupied by German troops in June, 1940, and placed under German civil administration on or about November 30, 1940. Area, 5,605 square miles; population (1936 census), 1,915,627. Lorraine was merged with the Saar district (Saarpfalz) to form the German province of Westmark. The provinces were occupied by Allied armed forces in 1944 and returned to France where they comprise the following departments: Bas-Rhin (1,848 sq. mi.; pop. 711,830); Haut-Rhin (1,354 sq. mi.; pop. 507,551); and Moselle (2,403 sq. mi.; pop. 696,246).

**ALUMINUM.** Primary aluminum production in the United States in 1946, the first full year of postwar production, was about 836,000,000 lb., according to preliminary estimates. Unprecedentedly heavy demand from industry and agriculture offset reduced military demand of the preceding war year, although falling far short of the 1944 production level, 1,552,892,000 lb.

The industry's wartime peak capacity of 2,350,609,000 lb. annually dropped nearly 50 percent to about 1,229,066,000 lb. in 1946. Plants built hastily by the government during the war to furnish metal for great air armadas were in most cases retired to standby status because of high operating costs. Several of the government plants, however, were sold or leased to private operators with the result that the 1946 primary metal capacity was almost four times the prewar capacity of 325,000,000 lb. annually.

Lease by the government of the Hurricane Creek, Arkansas, alumina plant and the Jones Mills, Arkansas, aluminum reduction plant to Reynolds Metals Co. (see 1945 YEAR BOOK) was followed during the early part of 1946 by lease arrangements to private companies of nearly all the other government-owned plants for which peacetime production is economically feasible. These include the Phoenix, Arizona, extrusion plant to Reynolds; the McCook, Illinois (Chicago) sheet mill to Reynolds; the Baton Rouge alumina plant, the Spokane, Washington (Trentwood), sheet mill and also the Tacoma, Washington, reduction plant to the Henry J. Kaiser interests; the Spokane (Meade) reduction plant to the Kaiser interests; the Troutdale, Oregon, reduction plant to Rey-

nolds; and several smaller plants. The dismantled Cressona, Pennsylvania, extrusion plant was sold to Aluminum Co. of America.

The postwar industrial scene was radically changed from that of prewar years, not only by greater production capacity and heavier demand, but by the emergence of large new firms as producers and users of the metal. The Aluminum Co. of America, ruled a monopoly in aluminum ingot production in violation of the Sherman Act in 1940, had only 52.4 percent of national capacity by the end of 1946. Reynolds Metals Co., primarily a producer and fabricator of finished products prior to the war, in 1946 owned or controlled 30.1 percent and Kaiser, a newcomer to the aluminum business, 17.4 percent.

Although ample facilities appeared to exist for producing the metal, itself, further expansion of mills to roll it into finished form were in prospect. Aluminum Co. of America announced plans to build a new mill at Davenport, Iowa, for rolling 120,000,000 lb. of sheets and plates a year. One interesting feature of this new plant is that it will be able to roll aluminum plate sizes to provide for marine shipbuilding needs.

The demand for aluminum, far above prewar levels as expected, was swollen by shortages of steel and other metals with which it can be used interchangeably, although at higher cost. Building and construction far outran their prewar rank as a consuming industry. In November, 1939, construction required eight percent of the aluminum produced, and it had been estimated that the postwar demand would be about nine percent. Instead, shipments of the Aluminum Co. of America from January through June, 1946, indicated that more than 11 percent was going for architectural uses. Roofing and siding, comparatively new commercial products, took more than 15 percent in direct competition with galvanized steel and other materials. While this latter demand may have been abnormally high because of the shortage of steel, aluminum going into construction during the first half of the year nevertheless took nearly one-quarter of the industry's total shipments. In 1947, it was estimated that the government's prefabricated housing program alone would require 400,000,000 lb., about one-third of the total supply. Land, air, and water transportation, which in November, 1939, used approximately 29 percent of output, and which it had been anticipated would require about 34 percent of postwar production, took only about 10.5 percent in the first part of 1946. The actual volume of metal used, however, was much greater than prewar. Demand for aircraft construction, although much greater than prewar, dropped sharply from wartime peaks. Use in truck, bus, trailer, and railroad car construction is expected to expand gradually for a number of years as manufacturing costs and regulatory barriers are overcome. Use in decks and superstructures of ships had gained a toehold by the end of the year. Plans for use in automobile body parts by some manufacturers were delayed by temporary manufacturing obstacles.

Demand for many types of finished aluminum products, such as extrusions, was so great in the latter part of 1946 that delivery lagged by 20 weeks or more. Difficulties involved in returning to production some of the metal producing plants and rolling mills leased by private producers from the government kept them below capacity operation during most of the year.

Use of secondary aluminum—remelted from scrap—kept pace with increased demand for the new metal. Reserves of wartime scrap, much of it

from wrecked or obsolete aircraft, which appeared mountainous at the beginning of the year had shrunk considerably by the end. Market prices for scrap material of low alloy content, in demand by new metal makers as well as by remelters, zoomed. Total secondary aluminum production for the year was approximately 264,000,000 lb.

The Aluminum Co. of Canada, whose Quebec plant is the world's largest, found important foreign markets, including large sales to England. Its price was lowered in May to 13.25 cents per lb., delivered in Canada, compared to a United States price of 15 cents per lb. Fear expressed during bidding for surplus aluminum plants in the United States that the Canadian firm would become an important factor in the United States market were offset by the three cent per lb. tariff and by revision of Canadian currency values. Despite lower production costs, the currency action placed the Canadian plant in at least a temporary price disadvantage in United States sales. Power shortage and other factors cut the Canadian plant's operations to the rate of 300,000,000 lb. per year, about 40 per cent of capacity. It was even suggested by the United States industry that Canadian metal be "borrowed" to tide over needs of United States rolling mills for ingots during the period when the United States metal plants were being readied for resumption of production.

The basic process of making metallic aluminum—the conversion of bauxite ore ( $\text{Al}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ ) to alumina ( $\text{Al}_2\text{O}_3$ ) and subsequent reduction of the alumina—remained unchanged. Action of the Aluminum Co. of America in turning over to the government, royalty free, basic patents covering the conversion of bauxite to alumina made possible operation of the government-owned alumina plants by lessees, however.

Most aluminum metal and fabricating plants were involved in strike difficulties coincident with those which plagued the steel industry early in the year. The basic settlement which ended a month-long work stoppage in major Aluminum Co. of America plants on February 16 provided a general wage increase of 19 cents per hour. United States price remained unchanged at 15 cents per lb.

CHARLES T. POST.

**AMBASSADORS AND MINISTERS.** The accompanying table lists the chief diplomatic representatives from foreign countries to the United States and those representing the United States in foreign countries. [A = Ambassador; M = Minister; E = Embassy, L = Legation. Unless another city is shown, Washington, D.C., is the location of the addresses shown in column 2.]

<i>Representative from U.S.</i>	<i>Representative to U.S.</i>

**AMERICAN LABOR PARTY.** A political party, organized in 1936, which grew out of Labor's Non-Partisan League of New York. The ALP follows a policy of supporting, what it considers, the best qualified candidates in city, state and national elections. During 1946 it supported James M. Mead for Governor and Herbert H. Lehman for United States Senator in the New York State elections. State Chairman: Hyman Blumberg. State Secretary: Douglas MacMahon. Headquarters, 570 Seventh Ave., New York 18, New York.

**AMERICAN LEGION, The.** An organization of American veterans of both World Wars I and II. It became a two-war organization, October 29, 1942, when President Roosevelt signed Public Act 767, making honorably discharged veterans of World War II eligible for membership. The membership by Dec. 31, 1946, was composed of 66 percent World War II veterans. The outstanding declarations of the 28th National Convention held September 30 to October 4 at San Francisco came from the employment, foreign relations, rehabilitation, Americanism, Legislative and national defense committees. Most noteworthy of these mandates were: (1) an appeal to repeal limitations and ceiling imposed on the on-the-job training sections of the Legion-sponsored G.I. Bill of Rights, during the eleventh hour of the 79th Congress; (2) urging elevation of the federal security administra-

tion to cabinet rank; (3) asking restriction of all immigration until January 1, 1948; (4) proposing that air forces be made separate and coequal with ground forces and naval forces and urging a single department for national security, with provision for Army, Navy and Air Forces on an equal level; (5) proposing a program of universal military training; (6) demanding immediate redemption of G.I. terminal leave government bonds into cash; (7) asking exemption from currently accrued federal income taxes to the first \$5,000 of earned income for all honorably discharged World War II veterans with a minimum of 90 days' service; (8) endorsing and supporting positive foreign policy of the Government as expressed by Secretary of State Byrnes, demanding that our foreign policy be kept above the level of partisan politics, and condemning those who have used or who shall use the vehicle of foreign policy for any partisan political purpose.

**War Effort.** During the war The American Legion was active in drives resulting in the sale of hundreds of millions of dollars of war and victory bonds and in record collections of waste paper, scrap metals and other vital materials. It was also active in promotion of blood banks. The American Legion originated and played an important role in the program of civilian defense.

Special services to armed forces included distribution of phonograph records, playing cards, booklets, hospitality cards, and hometown newspapers. The American Legion collected more than 1,300,000 gifts for hospitalized servicemen and veterans through its 1946 nation-wide "Gifts for Yanks Who Gave" Christmas program.

The American Legion has always been instrumental in securing legislation to assist veterans, as well as legislation to strengthen national defense, promote Americanism, and improve the welfare of children. It has successfully championed many laws providing for adequate care of disabled veterans, war widows, and orphans. The American Legion during the second session of the 79th Congress guided a large number of veterans' measures through the high bodies. Among the major legislative achievements were: a bill to provide terminal leave for enlisted men of the armed forces; a measure liberalizing National Service Life Insurance held by veterans of World War II; a law extending social security benefits to dependents of World War II veterans; amendment of the Surplus Property Act to provide veterans with a set-aside list of items for purchase, and a priority in the purchase of the remaining items second only to that of the federal government; a measure providing a 20 percent cost-of-living increase in pensions to all disabled veterans of World War I and II, and removing reductions in pensions of hospitalized veterans; increased burial allowances for veterans; amendments attached to the G.I. Bill of Rights. It was largely responsible for legislation creating the original Veterans' Bureau, now the Veterans Administration; for the construction of government hospitals for veterans; for the passage of the Servicemen's Readjustment Bill (G.I. Bill of Rights) for World War II veterans. Legionnaires carry on nation-wide youth training programs in the interest of better future citizenship, such as Junior Baseball, Boys' State, Boys' Forum of National Government, the national high school oratorical contest, school medal awards, essay contests, and sponsorship of more than 3,000 Boy Scout Troops. Other activities of The American Legion include a continuing safety campaign, the annual poppy sale to benefit disabled veterans, demands for universal

military training, a \$50,000 campaign with its auxiliary to stamp out rheumatic heart disease, active participation in National Employ-The-Physically-Handicapped Week, efforts to protect re-employment rights of veterans, conducting campaigns to secure "Gifts for Yanks Who Gave." It has always vigorously combated subversive activities through its Americanism program. The American Legion originated the annual observance of American Education Week in 1921, and has been a strong supporter of education.

The Legion enlists an army of volunteers to serve during national disasters and emergencies. It favors a stern foreign policy in dealing with aggressors. It wages a continual battle to restrict immigration. It has financially aided needy veterans and their families. Its interest in a lasting peace is reflected by the attendance of American Legion observers at all meetings of the United Nations Council. A special seven-man housing committee made a thorough study of housing conditions throughout the nation in an effort to find means to break a tight bottleneck.

The prestige of The American Legion is enhanced by an impressive list of local, county, state and national government officials and business leaders who wear The American Legion lapel button.

By Dec. 31, 1946, the Legion had reached a new membership high of 3,326,556 in 15,807 posts in the 58 departments. This represented a net gain for the year of 1,658,814 members. The American Legion Auxiliary reached a new peak of 800,320 in the same month. This was a gain of 165,492 members. Units in the Auxiliary, as of Dec. 31, 1946, numbered 10,701 as compared with about 9,513 in the previous year. Other affiliates of The American Legion are the Forty and Eight, fun and honor society, whose members numbered 72,098 on Dec. 31, 1946. The Forty and Eight on Dec. 31, 1946, had 811 voituers. Its Auxiliary counterpart, the Eight and Forty, boasted 11,175 members in 380 salons on the same date. Sons of The American Legion, at the end of 1946, had 17,202 members in 3,498 squadrons.

The American Legion has two national publications, *The American Legion Magazine* and *The National Legionnaire*, with combined circulations of more than 6,543,000 (October 24, 1946) as well as approximately 393 weekly, semi-monthly, and monthly state, district, county and post news organs. The national public relations division issues a weekly news service and news clip sheet, which goes to a mailing list of some 17,000 daily, weekly, radio, labor, and college publications.

National Commander for 1946-47: Paul H. Griffith, Uniontown, Pennsylvania. National Headquarters: 777 North Meridian Street, Indianapolis 6, Indiana. Legislative, Rehabilitation and Employment Offices: Legion-owned Building at 1608 K Street, N.W., Washington 6, D.C. Offices in New York, New York are at No. 1 Park Avenue.

**ANDORRA.** A small republic in the Pyrenees between France and Spain, under the joint suzerainty of the French chief executive and the Spanish Bishop of Urgel. Area, 191 square miles; population, about 6,000. Capital town, Andorra. The language spoken is Catalan. Sheep rearing is the main occupation of the people. There is a governing body called the council-general consisting of 24 members elected for 4 years (12 elected every 2 years). The council-general nominates the First Syndic (President) and Second Syndic (Vice-President).

**ANGLO-EGYPTIAN SUDAN.** A territory under British-Egyptian condominium in northeast Africa, lying south of Egypt in the middle and upper watershed of the Nile River. Area, 987,500 sq. mi. approximately (some of the frontier has not been delimited exactly). Capital, Khartoum.

**Government.** Sovereignty is shared between Great Britain and Egypt, a fact symbolized by flying the flags of the two countries together over public buildings. The Governor-General is nominally an appointee of the Egyptian Government but is in practice an important British civil or military personage. Other high officials are also British, though in recent years more Sudanese have been admitted to the lower administration (4,020 of them were in such posts in 1944). Assisting the Governor-General there is a Council for the whole area, and for the Northern Sudan an Advisory Council (set up in 1943) of local dignitaries for consultation. There are 8 provinces, each under a governor. The southern Sudan is not regarded as sufficiently advanced politically for representative institutions. The judicial system makes provision for Mohammedan courts where Moslem law is applied. The country's defense is entrusted to the Sudan Defense Force. Units of this body participated in the reconquest of Ethiopia in 1941.

**Events, 1946.** By all odds the outstanding development of the year was the argument between Britain and Egypt and between divergent political forces in the Sudan, over whether the Condominium should give way to Egyptian sovereignty or to outright independence. (For account of Anglo-Egyptian negotiations in general, see EGYPT.)

The issue was brought out into the open by the arrival in Cairo on March 26 of the vanguard of a delegation which purported to represent all the political parties in the Sudan, said to number anywhere from seven to nine. Its purpose was to persuade the British and Egyptians to agree on independence for the Sudan and union under the Crown of Egypt. Impartial sources pointed out, however, that this group did not represent the sheiks, the tribal leaders or the advisory councils, and that in any case there was a widespread movement in the Sudan for complete independence without union to Egypt.

The position of the Labour Cabinet was stated by Foreign Secretary Bevin, also on March 26, as follows: "His Majesty's Government look forward to the day when the Sudanese will be able finally to decide their political future for themselves. It is not proposed by his Majesty's Government to influence their eventual decision in any way. His Majesty's Government have no object in the Sudan other than the true welfare of the Sudanese and this principle has likewise been proclaimed by the Egyptian Government in the Anglo-Egyptian Treaty of 1936.

"The welfare of the Sudanese cannot be secured unless a stable and disinterested administration is maintained in the Sudan. . . . In the meantime his Majesty's Government consider that no change should be made in the status of the Sudan as a result of treaty revision until the Sudanese have been consulted through constitutional channels."

Another important declaration was made by Major-General Sir Hubert Huddleston, the Governor-General, at the opening of the fifth session of the Northern Sudan Advisory Council in mid-April: "The Government aims at a free and independent Sudan, which will be able, when independence is achieved, to define for itself its relations with Britain and Egypt. With good will and a cessation of political upheavals, I see no reason

why even in the short space of the next five years a great advance should not be made, and in the ensuing five years progress should be sufficiently rapid to satisfy every one except the most extreme critics."

The leading pro-Egyptian party, called the *Ashigga*, was comprised for the most part of young intellectuals who wanted to get rid of British rule, completely and at once. On the other hand, the *Umma* party was dead set against Egyptian sovereignty. It favored complete independence, but preferred a continuation of British rule to any possibility of Egyptian control. The patron of this movement, said to have two million followers, was the Sayyed Abdel Rahman el Mahdi Pasha, religious leader and posthumous son of the Mahdi who had driven the Egyptians out of the Sudan in the early 1880's.

At the end of October the situation was aggravated by Sidky's statement, made on his return from conferring with Mr. Bevin in London (see EGYPT), that Britain had agreed to recognize Egyptian sovereignty over the Sudan. This declaration greatly excited the *Umma* party and brought about wholesale threats of resignation from Sudanese and British officials alike. Abdel Rahman was in London early in December to present the case of his followers, while on December 7 Governor-General Huddleston stated in Khartoum that he had received written assurances from Mr. Atlee that the "Sudan Protocol" left the people of that country free to choose their own future and in no way prejudiced their right to achieve independence. At the end of the year the deadlock between the two opposing and uncompromising points of view appeared complete, and it seemed probable that British rule was far from drawing to a close.

Meanwhile the British pursued their policy of raising economic and social standards. On March 11 the House of Commons voted £100,000 as the first installment of a development and welfare grant-in-aid of £2,000,000. Various projects were discussed, including the construction of a canal on the upper White Nile to circumvent the marshes and the *sudd*, thereby preventing vast quantities of water from being lost through evaporation.

During August the waters of the Blue Nile were in flood—the highest on record—and thus once more made evident the need for dams and other works along its upper reaches in Ethiopia.

**The Population and Its Economy.** Estimates of the population vary from 6,000,000 upward. In the northern, or open, part of the country the population is Arabized and Moslem; in the south it is largely pagan and more truly African in culture and race. Important centers are Khartoum, Omdurman, Wadi Halfa, Port Sudan (on the Red Sea), Kassala, El Obeid and El Fasher.

Some four-fifths of the world's gum arabic comes from the Sudan (exports in 1939: 23,617 tons). High-grade cotton is produced in increasing quantities: 334,164 acres under cultivation in 1944-45, from which cotton valued at £E5,201,738 was exported. More than half of this acreage is in the Gezira Irrigation Scheme, to be taken over by the Government in 1950. Other vast producing areas merely await the construction of dams and irrigation systems. Livestock statistics for 1944 were: 3,195,000 cattle; 4,808,000 sheep; 3,991,000 goats; 1,109,000 camels. There is little mining or lumbering and almost no industry. Communications are afforded by government steamers on the Nile and its tributaries, some 2,000 miles of railroad and a meager highway system.

ROBERT GALE WOOLBERT.

**ANIMAL INDUSTRY.** Bureau of. A Bureau of the U.S. Department of Agriculture, established in 1884, which deals with the eradication and control of animal diseases and parasites, conducts research on the production of livestock and their products, and otherwise seeks to protect and develop the livestock, meat, poultry, and related industries. Chief: Bennett T. Simms.

**ANTHROPOLOGY.** The year 1946 saw the return of most anthropologists in the United States to their professional status, after service in various branches of the government and the armed services during the war. Since the year was one of readjustment, it was not notable for a large quantity of research or publication. In general, the experience of the war years has given an impetus to new developments in this science, looking toward interdisciplinary collaboration in training and research. The postwar period has also stimulated some practical applications of anthropology which had been only vaguely foreshadowed previously.

**Physical Anthropology.** The outstanding event of the year in physical anthropology was the arrival in the United States of Dr. Ralph von Koenigswald from Java where he was incommunicado during the period of Japanese occupation. He brought with him all of the *Pithecanthropus* findings including *Meganthropus* and *Robustus*, as well as the teeth of Early Giant Man and the series of *Solensis* skulls. Dr. Franz Weidenreich is now collaborating with him at the American Museum of Natural History in a definitive study of these important fossil types. Early in the year, the bones and artifacts associated with so-called Pekin Man (*Sinanthropus*), which had originally been excavated near Choukoutien, China, were found intact in the Imperial University of Tokyo whither they had been taken by the Japanese. Likewise, the original records of Dr. Davidson Black were recovered. Work was started in 1946 at the Anthropometric Laboratory of Harvard University on one hundred thousand somatype photographs of army troops, under the direction of Professor E. A. Hooton. This work should provide the largest sample yet studied of the American male population. An expedition under Alejandro Lipschutz on behalf of the Chilean Government made a collection of blood types among natives of the Chilean Archipelago. All indigenes tested showed only blood group O, according to reports. In the summer of 1946 a special six weeks seminar session for professional physical anthropologists was inaugurated at Columbia University with the financial assistance of the Viking Fund. This is planned as an annual affair.

**Archaeology.** The largest research project in prehistoric archaeology of 1946 was the Viru Valley Project organized under the auspices of the Institute of Andean Research, and involving the collaboration of the Bureau of American Ethnology, the Institute of Social Anthropology, Columbia University, Yale University, the American Museum of Natural History, Chicago Natural History Museum, and the Instituto de Estudios Etnológicos of Peru. Intensive studies were carried on in the Viru Valley of Northern Peru. The most important discovery reported is a new pre-ceramic culture found in the Viru and Chicama Valleys. Although lacking pottery, these early people had agriculture.

Dr. Robert Heizer of the University of California discovered a site near Concord, California, containing artifacts and human skeletal material estimated to be about five thousand years old. Archaeological work in the West Indies continued under Dr. Irving Rouse with a four part chronology de-

terminated in Trinidad showing definite links between the West Indies and Venezuela. Joint work sponsored by the National Geographic Society and the Smithsonian Institution continued under Matthew W. Stirling at the San Lorenzo site on the Rio Chiquito in Southern Mexico. Five more huge human heads sculptured from basalt were found, associated with the La Venta culture now dated as 500-800 A.D. On the high plains of Northwest Texas, Dr. E. H. Sellards reported finding a site containing twenty-seven arrowheads and knives associated with skeletons of 500 giant, extinct bison.

The Peabody Museum of Harvard University announced receipt of a bequest of \$200,000 for research in Mexican and Middle American archaeology from the estate of Charles P. Bowditch.

A Caribbean archaeological congress was held in Honduras in July to discuss problems of pre-history in this area.

**Ethnology and General Cultural Anthropology.** The University of California published a study by the late Kurt Nimuendajú on the Eastern Timbira, a Gê tribe of Brazil. Dr. Lila O'Neale published under auspices of the Carnegie Institution the most comprehensive study yet made of native Guatemalan textiles. According to reports in the press, Boris Piotrovsky was given the Stalin prize for his work on history and culture of Urartu, an ancient civilization which flourished in Armenia about the 13th century B.C. The Institute of Social Anthropology of the Smithsonian Institution extended its collaboration with Latin American countries through the establishment of offices in Colombia and Brazil, in addition to those previously established in Mexico and Peru. The formation of a new National Institute of Social Anthropology was announced in Colombia, and during the year the Instituto Indigenista of Guatemala carried out its first field and administrative work.

**Interdisciplinary Developments.** One of the significant trends in postwar anthropology has been a movement toward the integration of cultural anthropology with other disciplines of the social sciences. Among concrete manifestations of this trend may be mentioned the following: September, 1946, saw the opening at Harvard of a new Department of Human Relations which included on its staff several cultural anthropologists as well as sociologists, psychologists, and other social scientists; the University of Wisconsin launched a study of modern Wisconsin culture which also involves the collaboration of anthropologists and other social scientists; the University of North Carolina at Chapel Hill added a professor of anthropology to its staff, under whom a three year study of the culture of the South will be carried out.

In June a Pacific Science Congress was held in Washington to consider scientific problems of the islands occupied as a result of the war. In this meeting anthropologists played an important part, along with other scientists in an integrated program. As a result, the National Research Council Committee on the Anthropology of Oceania was reconstituted under the chairmanship of Dr. George P. Murdock to assist in integrating anthropological research.

The National Research Council Committee on Latin American Anthropology was reorganized during the year, and published a comprehensive survey of research in geography and anthropology currently being carried forward in North American institutions. Anthropologists attended as official delegates the Inter-American Congress of Geography and History which was held at Caracas, Venezuela, in August.

**Personnel.** Some changes in major academic personnel occurred in 1946. Professor A. L. Kroeber retired as head of the Department at the University of California. Earlier in the year he delivered the Huxley lecture in London at the invitation of the Royal Anthropological Institute, and upon his return to this country received the degree of Sc.D. from Yale University. Professor A. M. Tozzer of Harvard was appointed to the John E. Hudson Professorship of Archaeology to succeed Professor George H. Chase, retired. Professor Fay Cooper-Cole announced his intention of retiring from the head of the Department in Chicago in 1947 to be succeeded by Dr. Robert Redfield who resigned as dean of the Division of Social Sciences in that institution in the summer of 1946. Dr. Ralph Linton took up his new post as Sterling professor at Yale.

JOHN GILLIN.

**ANTIGUA.** An island presidency, the largest of the British Leeward Islands. Area, 171 square miles, including the dependent islands (Barbuda and Redonda, 63 sq. mi.). Total population, January 1, 1944, 41,024. St. John (10,000 inhabitants), the capital of Antigua, is the seat of government of the Leeward Islands. In addition to representation in the federal legislative council of the Leeward Islands, Antigua has a local government consisting of an executive council (presided over by the governor) and a legislative council (presided over by the administrator) of 11 members. Administrator, Leslie Stuart Greening (September 4, 1945).

In World War II United States naval and sea-plane bases were established near Parham Harbor. The base sites, leased for 99 years, were approved by the Antigua legislative council on December 20, 1940, and confirmed in a formal treaty signed in London March 27, 1941, by the British and United States Governments.

In 1943 the birth rate was 35.06 per 1,000 and the death rate 15.54. The chief products are sugar and rum. Imports in 1943 (£464,592) considerably exceeded exports (£343,255).

ALZADA COMSTOCK.

**ANTITRUST DIVISION.** A Division of the U.S. Department of Justice charged with the enforcement of the antitrust and 30 kindred acts. The Division receives complaints and, in cooperation with the Federal Bureau of Investigation, conducts investigations which, where appropriate, lead to criminal prosecutions or suits in equity designed to break up monopolies, restraints of trade, cartels, agreements with foreign corporations, and restrictive patent arrangements. The Small Business Section of the Division receives complaints and appeals for help from small business concerns throughout the country and, when justified, represents their interests before other Government agencies. If the investigation indicates a violation of the antitrust laws, this Section recommends appropriate action by the Division. Assistant Attorney General in charge: Wendell Berge.

**AQUEDUCTS.** To meet the ever increasing demands for water for domestic and industrial purposes, as well as for irrigation and power development, it becomes necessary to go farther and farther away to reach new sources of supply and then to build aqueducts to bring in this additional water. A conspicuous example is the 82-mile tunnel aqueduct to bring water from the Delaware River as an additional supply for New York City. The necessary operating equipment is being installed. Considerable power may be developed in the flow from this

aqueduct and its reservoirs, and it is proposed that use of this power may be sold to utility companies. The city has the right to use it, but the cost of machinery, equipment and transmission lines would make this uneconomical.

As Arizona has been allocated a share in the flow of the Colorado River, the State, in cooperation with the U.S. Bureau of Reclamation, is preparing plans for an aqueduct to deliver the water to Phoenix and for irrigation of the arid central plateau. The adopted project calls for a 600-foot dam in Bridge Canyon, an aqueduct consisting of a tunnel 77 miles long, and then an 80-mile main canal. In Arizona, also, the city of Tucson is to increase its water supply by a 60-mile aqueduct from a new dam and reservoir on the San Pedro River. Certain hazards of such long aqueducts are indicated by an accident in March to the Owens Valley aqueduct serving Los Angeles, when the steel pipe line was fractured in several places by boulders loosened in the mountains by earthquake shocks.

Approaching completion is the 72-mile aqueduct to bring a supplementary supply of water to San Diego, California, but some controversy has arisen over the respective rights and responsibilities of the city and the county water-district. A group of cities around San Francisco Bay will jointly increase their water supply by building an 82-mile line of 67-inch welded steel-pipe from the Pardee River, practically paralleling an older but inadequate line. The pipe is to be laid mainly underground, but for some miles of swampy land it will be supported on concrete piles. In Michigan, the two cities of Midland and Saginaw have combined to bring in a new supply from Lake Huron by an 82-mile aqueduct comprising 36-inch and 48-inch pipe. A submerged intake in the lake will be connected with the head of the aqueduct by a two-mile line of 66-inch steel pipe.

Numerous aqueducts of various types (including canals, tunnels, siphons, pipe lines and open conduits) are built by the U.S. Bureau of Reclamation in its vast irrigation program, which includes also power and flood control. The following are now under construction: (1) Salt Lake aqueduct for irrigation and municipal supply, 41 miles, from Deer Creek reservoir on the Provo River, near Provo, Utah, to the Sam Parker reservoir of Salt Lake City. (2) Coachella Canal, a branch of the All American canal system, from Yuma, Arizona, to Indio, California, 145 miles, with 84 miles completed. (3) Friant-Kerr canal, on the Central Valley project in California, from the Friant dam to Bakersfield, 160 miles, begun in 1945. (4) Contra Costa canal, 47 miles, almost complete. (5) Delta-Mendota canal, 120 miles, under construction. (6) Delta Cross canal, 50 miles. Canals (3) to (6) are on the Central Valley irrigation project, to serve the San Joaquin valley. (7) Columbia main canal, under construction, to carry water pumped from the Grand Coulee dam on the Columbia River.

Pipe lines for the transmission of oil, oil products, and natural gas may be classed as aqueducts, and there has been considerable activity in their construction. But the spectacular war work of such lines has given place to ordinary commercial progress. Thus the "Big Inch" and "Little Big Inch" lines from Texas oil fields to refineries on the Atlantic coast have been sold, and the multiple lines of lead pipe laid across the English Channel in the last stages of the war have been salvaged and melted down. However, the Federal Power Commission has authorized other long lines, as from Texas to West Virginia, 1,265 miles, and Texas to

Wisconsin, 1,200 miles. One of these is to cross the Mississippi by an aerial section having three spans of 3,336 feet and one of 1,668 feet. There will be three 26-inch pipes, at 85 feet above the water to clear navigation. Other lines are to be from Monroe, Louisiana, to St. Louis, and from Texas to Los Angeles.

There has been controversy in Congress over the practical value of the Canada-Alaska oil pipe built by the U.S. Army as a war measure and now abandoned. Some 3,330 miles of oil pipe line, built by the United States forces in India, Burma, and China to serve the fighting fronts, have been sold as scrap. Venezuela is extending pipe lines. In Bolivia, a line is being built by U.S. contractors from the Camiri oil fields to a railroad terminal at Tiutui, 235 miles, with a summit elevation of 9,860 feet. Russia is reported as building several pipe lines, including one from Dashava, in the Ukraine natural-gas fields, to Kiev, 325 miles. See DAMS, WATER SUPPLY.

E. E. RUSSELL TRATMAN.

**ARABIA.** A large peninsula in southwestern Asia. Area, approximately 1,000,000 sq. mi.; population, upwards of 10,000,000. The political subdivisions are treated separately below. Other countries in the Middle East with Arab-speaking populations, but not included under the heading "Arabia," are Egypt, Iraq, Lebanon, Palestine, Syria and Trans-Jordan. The various parts of Arabia may be divided into two broad political categories: independent states, and territories under British sovereignty, protection or influence.

They are all inhabited by almost solidly Moslem populations, though of diverse sects. The ancient Arab stock, still overwhelmingly predominant in the interior, has been diluted with African, Indian, Iranian and other elements along the coasts. Nomadism has diminished greatly in recent decades, even in the desert interior, and today the population is mostly sedentary. Education is still largely religious in nature and confined to males, except where British or missionary influence has been felt. Economically the region is probably on the threshold of a renaissance due to the billions of barrels of oil in its subsoil, now in process of exploitation.

The two independent states are Saudi Arabia and the Yemen.

**Saudi Arabia.** This state occupies the interior desert as well as some of the dry coastal regions on both the Persian Gulf and the Red Sea. It is primarily the creation of its present ruler, King Ibn Saud. Following the First World War he annexed the Kingdom of the Hejaz to his original state of Nejd, thus coming into possession of the Moslem Holy Cities of Mecca and Medina, the pilgrimages to which are in normal times lucrative sources of income. There are two capitals, Mecca and Riyadh. Theoretically there is also a distinction between the governments of the Nejd and Hejaz, since the former is an absolute monarchy while the latter is nominally under a constitution.

The estimated area exceeds 700,000 sq. mi., with a population probably in excess of 5,000,000. There are several cities and even a few seaports, notably Jidda; but by and large the population does not congregate in the urban centers. Various dialects of Arabic are spoken. Ibn Saud and his desert subjects are fanatical followers of the puritanical Wahabi sect. The population is racially not entirely homogeneous, since for many centuries there has been a trade in slaves from Africa that has inevitably introduced considerable Negro blood into many parts of the country.

Saudi Arabia has only recently started to become a part of the world economy through the discovery of large oil resources now being developed by the Arabian-American Oil Co., a subsidiary of the Standard Oil Co. of California and the Texas Oil Co. The royalties from this oil production are being used to construct roads, expand irrigated areas, and in general to open up the country. Both the export and import trades of Saudi Arabia are statistically unimportant except for crude oil. The small production of cereals and animals goes almost exclusively to satisfy the local markets.

**Yemen.** This country, sometimes referred to as Arabia Felix, contains some 75,000 sq. mi. and a population of around 3,500,000. It is ruled by an hereditary Imam, whose capital is at San'a. Unlike Saudi Arabia, much of the Yemen is high and fairly well watered. Agriculture is carried on extensively, with such crops as barley, wheat, millet, and coffee. Coffee has been the country's principal export, much of it coming out through the port of Mocha.

Until recent years the Yemen has been virtually inaccessible to Europeans, and even today few are allowed to penetrate into the country. In the same way, the Imam has pursued a policy of almost complete isolation from world affairs. However, the Yemen has become a member of the Arab League. The population is Arabic-speaking, with some Negro blood evident here and there. There are also remnants of once important Jewish communities.

The parts of Arabia within Britain's sphere of influence show a wide variety of political structures.

**Aden.** This is the only British crown colony in Arabia. It is located at the southwestern tip of the peninsula at the entrance to the Red Sea. The city of Aden, the capital, lies some 100 miles east of the Straits of Bab-el-Mandeb. The island of Perim, just north of the Straits forms part of the colony, but its harbor has been closed for a number of years. The colony has an area of 80 sq. mi. and a population of over 50,000. It is administered by a Governor aided by an Executive Council. There are no representative institutions. The colony produces almost nothing for export, and its chief function in the British imperial scheme is as a naval and supply base along the short route to India. Such commerce as there is consists largely of transit trade. The barren terrain obliges the inhabitants to import even simple foodstuffs from elsewhere. In 1944, 2,741 merchant vessels stopped at Aden, as well as 2,252 local craft. The inhabitants represent a mixture of Arab, Indian, Somali, and other African peoples.

**The Aden Protectorate.** North and east of the crown colony there extends a vast area of some 120,000 sq. mi., known as the Aden Protectorate. It is largely desertic. The Protectorate is under the general supervision of the Governor of Aden, but the actual administration is left mostly in the hands of the local sultans. The Western Aden Protectorate is comprised of 19 Sultanates, of whom the Sultan of Lahej is the Premier Chief. The Eastern Aden Protectorate encompasses the Hadhramaut (containing the Q'aiti State of Shihri and Mukalla and the Kathiri State of Seiyun), the Mahri Sultanate of Qishn and Socotra, the Wahidi Sultanates of Bir'Ali and Bahihaf, and the sheikdoms of 'Irqa and Haura. The population is probably around 600,000, most of which is concentrated in the coastal cities and in the fabulous skyscraper towns nestling in the interior valleys. Many persons of Negro ancestry are encountered in this region. Trade is on a local scale, though some of the more

prominent families of the Hadhramaut have acquired fortunes in Malaya and the Dutch East Indies.

**Muscat and Oman.** Located in the easternmost corner of Arabia, this country is nominally an independent Sultanate. It is, however, definitely within the British sphere of influence, which is predominant throughout Southern Arabia and in the Persian Gulf area. There are more than 82,000 sq. mi. and probably 500,000 inhabitants. Most of these are Arabs, with Indians and Negroes represented in some of the coastal centers. Muscat is the capital, but Matrah is the principal commercial center for what little trade there is in the Sultanate. Most of the country is hot and quite barren, the principal exception being the higher regions around the Jebel Achdar where there is some cultivation. Dates constitute the principal product and export commodity, with rice coming first among the imports. Few vessels call at Muscat and internal communications are of a primitive sort. Few outsiders ever visit the country.

**Trucial Oman.** Lying north of Oman along the coast of the Persian Gulf is a relatively small area controlled by seven petty rulers known as the Trucial Sheiks. Their external affairs are under the control of Britain, represented by a Political Officer and a Residency Agent for the Trucial Coast. Altogether this area contains no more than 100,000 inhabitants.

**Qatar.** A sheikdom comprising the peninsula of the same name in the Persian Gulf, with a population of probably 30,000 and an area of 8,500 sq. mi. Its status *vis-à-vis* Great Britain is similar to that of the Trucial Sheiks.

**Bahrain Islands.** An archipelago in the Persian Gulf off the coast of Saudi Arabia. On Bahrain, the largest of the islands, there are oil wells and refinery installations owned by a subsidiary of the Standard Oil Co. of California and the Texas Company. There is some pearl diving and intensive agriculture, but the chief export is oil products. Bahrain is also the chief outlet for the trade of the neighboring parts of Saudi Arabia. There is a hereditary ruling Sheik who of course leans heavily on the advice of the British Political Agent. The population exceeds 120,000 and includes Persian, European and American communities.

**Kuwait.** A small territory of less than 2,000 sq. mi. wedged in between Iraq and Saudi Arabia at the northwestern corner of the Persian Gulf. The hereditary Sheik is assisted by an advisory council and a British Political Agent. The population probably exceeds 100,000. Oil was discovered in 1938 and its exploitation will undoubtedly greatly alter conditions here as it did in the Bahrain Islands.

**Events, 1946.** **Saudi Arabia.** In January King Ibn Saud returned the visit made by King Farouk of Egypt during the preceding year. Traveling on the Egyptian royal yacht, the Arabian monarch was in fact a guest of Farouk from the moment he left his own country. In Egypt his sojourn was marked by all the courtesies and honors befitting so historic an occasion, for it must be remembered that relations between the two states had been anything but cordial during recent years. While in Egypt Ibn Saud carried on political conversations with various personalities, including Jamal el Hussein, cousin of the exiled Grand Mufti of Jerusalem, who himself had only just returned from detention in Southern Rhodesia. The question of Ibn Saud's grant of the right of asylum to Rashid Ali el Gailani, wanted by the Iraq government on charges of leading the pro-Axis revolt of 1941, was naturally raised in the press, since it was generally believed

to be a cause of friction between Saudi Arabia and Iraq. Ibn Saud was reported to have stood on the ancient Arab tradition by which he was obliged to grant sanctuary to anyone who threw himself on his royal mercy. On leaving Egypt, Ibn Saud declared that it was the duty of all Arabs to support the Arab League.

Another milestone along the road of Saudi Arabia's emergence from isolation was the arrival in Washington late in January of Asad al Faqih, first minister from that country to the United States. He presented his credentials to President Truman on February 8. In the *New York Times* for the same day there appeared a dispatch stating that the large airfield at Dhahran, in the northeastern part of Saudi Arabia near the Persian Gulf, was nearing completion. In fact, it was ready for use by February 28, though work continued on its installations throughout the year. With the transfer of Payne Field near Cairo to Egyptian control, the Dhahran field became the most important American base between Tripoli and Karachi. In addition to American personnel, some 135 Italians from Eritrea and an equal number of Arabs were employed there. According to the agreement with Ibn Saud, the United States was to be allowed to use this field for military purposes for three years, after which it would revert to the Saudi Arabian government, though it would still be open to use by civil airlines and operated by American civilian personnel. The Americans were also maintaining two emergency fields in northern Saudi Arabia along the air routes to Palestine and Egypt.

During the summer an eleven-man financial mission from Saudi Arabia was in Washington to obtain a credit from the Export-Import Bank. It was formally announced on August 9 that the sum involved was \$10,000,000. In view of Ibn Saud's orthodox religious scruples against the payment of interest, the credit bore no interest rate but was granted on a discount basis. Among the things which Ibn Saud wanted to construct with the help of foreign capital was a railroad from the Persian Gulf to his capital at Riyadh.

But while the economic and financial relations of the two countries were on this cordial plane, their political relations were said to have suffered as a reflex of the Palestine problem. On March 19 a subcommittee of the joint Anglo-American Commission of Enquiry for Palestine was told by Ibn Saud that all Arabs and Moslems would become the enemies of the United States and Great Britain if they persisted in favoring the admission of Jewish immigrants into the Holy Land. In this connection, the King recalled the promises contained in the letter he had received from President Roosevelt shortly before the latter's death (see *YEAR BOOK* for 1945, p. 40). When, later, the report of the joint commission was published (see *PALESTINE*), Ibn Saud characterized it as "an injustice without precedent."

During the American electoral campaign in the early fall, President Truman, along with other leading political figures, expressed himself on the Palestine Problem, reiterating his previous stand in favor of the immediate admission of 100,000 displaced Jews from Europe. On October 17 the Saudi Arabian legation in London released the text of a letter from Ibn Saud to the President in which the former expressed his surprise and chagrin at hearing of Mr. Truman's pro-Zionist statements, which he found to be in plain contradiction to previous official American pronouncements and commitments. A few days later the President, in his reply, denied any inconsistency and once again

declared himself in favor of a "national home" for the Jews in Palestine and of the immediate entry of 100,000 European Jews into the Holy Land.

Apparently the activities of Communist or other agitators had finally penetrated into the fastnesses of desert Arabia. At any rate, a Saudi Arabian communiqué, published in Cairo on July 16, warned the people of that country against any political activity or propaganda in the "Holy Land of Islam."

In December it became known that the Standard Oil Co. of California and the Texas Co., co-owners of the Arabian-American Oil Co., were preparing to sell an important interest, said to be 40 percent, in the latter to the Standard Oil Co. of New Jersey and the Socony-Vacuum Co. The deal was expected to be consummated early in 1947.

**Yemen.** The last of the Arab countries to be drawn into the stream of contemporary international events was the Yemen. On February 12 the United States Department of State revealed that this ancient Arab state had requested that an American mission be sent there to open diplomatic relations. Such a mission was appointed, headed by Col. Eddy, American Minister in Jiddah, and containing experts in health, agriculture and trade. After twenty-three days of leisurely conversations in San'a the mission returned to Jiddah, where on May 11 Colonel Eddy declared that relations between the two countries had been established. He asserted, however, that while the Yemen desired foreign technical advice, it did not want any mass immigration or the creation of foreign settlements within its territory. A few days later the State Department confirmed this announcement by revealing that a provisional agreement had been entered into for the exchange of diplomatic and consular representatives, commercial and navigation rights, and reciprocal juridical protection.

On April 11 Egypt likewise entered an agreement with the Yemen for the exchange of diplomatic agents. Meanwhile, the Yemen took an increasingly active part in the affairs of the Arab League.

Early in December it was reported from Jiddah that a large-scale Soviet mission, including economic and geological experts, was expected to visit the country in the near future. Diplomatic relations between Russia and the Yemen had been opened several years before, though there was no Soviet mission in permanent residence.

A portent of coming trouble for the Yemen was contained in an appeal, made early in December by the Iman's eighth son, Prince Seif-ul-Islam Ibrahim, to the Arab League for aid in bringing his father's "despotic" rule to an end. Some observers believed that the demise or incapacity of the aged ruler would lead to a dynastic upheaval or even a civil war in the Yemen.

**Bahrain and Kuwait.** An old quarrel between Iran and Britain over the ownership of Bahrain Islands in the Persian Gulf was revived by the Teheran government. This it did on April 18 by announcing that it would impose on all oil entering Iran from Bahrain a tax equivalent to that collected on the production of the Anglo-Iranian Oil Co. in Iran. This was a matter of some importance to the United States, since the Bahrain Petroleum Co. was owned by the Standard Oil Co. of California and the Texas Oil Co.

At the general meeting of the Anglo-Iranian Oil Co. held in London during July, the chairman, Sir William Fraser, reported: "In the course of my journey in the Middle East I visited Kuwait and had a most hospitable welcome from H. H. the

Shaikh, who has always taken the keenest interest in the Kuwait Oil Company's affairs. We operate through that company in equal partnership with Gulf Oil Company (U.S.A.) and our plans for production have recently matured. Wells have been reconditioned and tested, a production system has been installed, and a loading terminal, its submarine pipelines, have been constructed on the shores of the Persian Gulf. Shipment of crude oil began this month. Thus within a relatively short period, during much of which the war hampered or entirely suspended operations, this concession has been brought into productive operation and substantial reserves of crude oil have been proved."

ROBERT GALE WOOLBERT.

**ARCHAEOLOGY.** With the lifting of wartime restrictions, accounts of accidental discoveries due to the Second World War and of post-bellum excavations are more common. Most excavation reports by scholars have appeared to date only in the *Illustrated London News*, or in short summaries in learned periodicals which begin once again to function. Discoveries are reported from Greenland to South Africa. The fine gold mask of Shishak I and wrought silver coffin of Psusennes, discovered by Montet (*Tanis*, 1942), have been almost equalled by his more recent discovery of the gold mask of Endjedot, an Egyptian general and leader of King Psusennes' archers (ca. 1000 B.C.), together with three gold pendants with chains, golden bowls, and scarabs. The finest tomb yet known from the first dynasty is announced by Montet.

**Orient.** Excavations under the Director General of Archaeology in India, at Harappa in the Punjab, have reversed our ideas that the civilization there was that of a peaceful bourgeois democracy. Fortification walls of mud brick on a dominating mound, 400 yards long by 200 yards wide, rising 50 feet above the level of the plain, indicate that the city was militant, like contemporary settlements in the Orient. The rampart was more than 36 feet thick and 40 feet high, faced on the outside with baked bricks sloping inward. These walls, with towers at intervals and unexcavated gates, present an external appearance not unlike the stone constructions of Troy. The buildings stood on a high platform of mud and mud brick, protected from floods. Because much of the site has been robbed of its bricks, the buildings must be restored from structures at Mohenjo-daro, in Sind, where organized slave or semi-slave labor under an autocratic or bureaucratic regime apparently formed the characteristic social structure. Exploration of a neighboring cemetery, where half a dozen extended skeletons were found, buried in reed shrouds in wooden coffins and surrounded by food vessels and offering-stands, indicates, from its pottery, that the civilization at Harappa lasted from ca. 2500 to 1500 B.C. The Rigveda speaks of invasions of Aryans and calls Indra, the Aryan war-god, the "fortress destroyer." He is said to have destroyed about a hundred citadels and to have been able to "rend forts as age consumes a garment." This Indo-European invasion is usually placed ca. 1500 B.C. The new excavations at Harappa help to confirm this literary account. Massacred men, women, and children in the topmost levels of Mohenjo-daro may furnish further confirmation (R. E. Mortimer Wheeler, *ILN*, August 20, 1946).

At Tell Harmal, six miles from Baghdad, Iraq excavators under the direction of Seton-Lloyd excavated a mound with a heavily fortified enclosure, massive buttressed walls and a single entrance flanked by life-sized lions of terracotta.

Public buildings, along with circular platforms for pounding grain, suggest that this was the administrative center of an agricultural district. A large temple of Nisaba, goddess of fertility, and her consort, Khani—the two patrons of learning and written archives—was discovered, along with 1,300 clay tablets. These tablets contained legal and commercial documents, lists of officials, wages, geographical lists, lists of gods, of property, etc. The center was important in the second millennium. A clay cylinder from the site is believed to show musical notation.

**China.** The tomb of the bandit Emperor Wang Chieng (d. 918 A.D.) was discovered outside the west gate of Chengtu. It was a barrel-vaulted structure of three rooms—an anteroom with bronze-studded doors, the burial chamber, and a room with a seated statue of the Emperor. The Emperor's jade seal and a tablet of rectangular pieces of jade covered with writing were placed on a platform before the statue in boxes made of iron, lacquer, and silver. The platform for the casket in the burial chamber was upheld by huge muscular figures of sculptured warriors and was adorned above and below by floral reliefs and figures of musicians and dancers. Before it stood a large stone basin which held oil for the lamp of 10,000 years. The Emperor's jade belt, carved with dragons, and silver vessels were also found. The body was probably stolen by robbers in order that they might remove the jewels and jade. The tomb is an important example of T'ang construction, and gives valuable evidence for burial customs of the Emperors, up to now unknown. Treasures of jade and fine T'ang reliefs, still richly colored, add to its value.

**Cyprus.** Excavations by P. Dikaios at two sites near the northwest coast of Cyprus have resulted in discoveries which indicate that copper-mining was carried on in the island in the third millennium B.C.—a refutation of the claim that copper was not exploited there much before 1000 B.C. Two molds for copper oxheads, one of terracotta, the other stone; a crucible with copper slag adhering, and remains of workshops where copper-working was carried on, were discovered. The excavations close with the material found a gap of two centuries that hitherto existed between the end of the Chalcolithic period and Copper Age.

The over life-size bronze statue of Septimius Severus, probably the finest portrait statue of the Emperor extant, has been set up in the Cyprus Museum. Found in parts in 1928, it was reconstructed during the war. The Emperor is shown nude, in heroic fashion, with both hands gesticulating, apparently addressing his troops or a crowd.

**Crete.** Chamber tombs and beehive tombs (tholoi), mostly dating after 1200 B.C., constitute the most significant discoveries. The outstanding Tholos, dating from Minoan times, had been partly destroyed and looted, but was reused in the geometric and orientaling periods (IX–VII C.). The latter period produced a pot filled with jewelry: a lunette crystal pendant with gold chain and amber inlays; a crescent-shaped pendant with male heads in gold at the ends; a gold diadem with male figures between lions; plaited chain bracelets ending in snake-heads; gold ingots, silver chains with duck-head terminals, crystal beads and paste scarabs—all belonging to a closed deposit of ca. 650 B.C. A clay model of a house with flat roof, windows, ventilation holes and chimney, furnishes our only house-model from a tomb. Figures in gold leaf of a male ram-bearer and part of a female one were discovered in the entrance. At Amnisos, the

harbor town of Knossos, a house dating from the XVI-XV C. with walls 10 feet high and mural paintings was found.

**Greece.** At Pallantium in the Peloponnese Italians uncovered two archaic temples, with wooden columns one of which had brick walls. Bases of wooden columns occur on either side of the cult statue base. At Olympia, more bronzes were discovered by the Germans: statuettes, helmets, tripods, shields, greaves, and arm-bands (AA. 1940-45).

At Delphi additional ivories were unearthed by the French below a staircase leading down to the Stoa of the Athenians where the ivory caches of 1939 were turned up. The new ivories represent a cock, the upper half of a small figurine, and open-work ornaments for the dress of a statuette.

A Thracian tomb at Vize brought to light a fine pair of silver cups, ornamented with storks, like those of Boscoreale; a silver cup with satyr's mask, thyrsi, etc.; a bronze helmet in the form of a youth's head; a gold laurel crown and other objects of gold and silver.

**France.** At Aix in Provence unusual examples of Celto-Ligurian sculpture of the second century B.C. were turned up by Germans while they were digging earthworks. The monuments are badly preserved, presumably damaged by Roman conquerors in retaliation for an attack on Marseilles in 179 B.C. by the Salians, a Gaulish tribe. The crudely carved heads represent members of this tribe: heads of warriors, one helmeted, a bas-relief with four severed heads of captives, a square monument with praying figures in niches and portraits of a Salian chieftain and his wife above.

**Britain.** At Low Ham in Somerset, the cold plunge (frigidarium) and Turkish bath (caldarium) of a Roman bathing establishment belonging to a fourth-century Roman villa were brought to light. In the frigidarium a well-preserved mosaic of large size was uncovered, with scenes representing the love of Dido and Aeneas. The central design shows a nude figure of Venus with Cupids; below, Dido and Aeneas locked in each other's arms; above, Aeneas and Dido with Venus and the young Ascanius in the background. On the long side riders in the hunt are depicted and the Trojan fleet at anchor off Carthage. (ILN. May 11, 25, August 17, 1946).

At Mildenhall, Suffolk, an amazing collection of fine Roman silver, probably of the third century A.D., was turned up by the plough. Thirty-four preserved pieces of excellent workmanship were found. The finest is a large silver tray, more than two feet in diameter, adorned in the outer circle with Neo-Attic figures of Pan, reveling Maenads and Satyrs in relief, while in the inner circle sea divinities—Tritons and Nereids—are shown in revels. The head of Ocean occupies the center of the bowl. Two superb round trays of smaller size are decorated with figures of Pan, satyrs, and Maenads. Seven shallow bowls are adorned with figures of animals in relief or occasionally with ornamental patterns. In addition, there are five small finger bowls, and other bowls with dolphin handles; eight spoons, some with Christian symbols; additional bowls, some fluted, some with covers, trays, stemmed goblets, and handles. The treasure ranks with the well known Treasure of Boscoreale of the time of Tiberius, and the Treasure of Hildesheim. (ILN. June 29, July 6, 1946)

**Italy.** Under St. Peter's in Rome a large cemetery with pagan and early Christian tombs, dating from ca. 150 through the third century A.D., was found. More than a dozen mausoleums came to light with many unusual sarcophagi, some with scenes from

the Old and New Testaments, others with Egyptian motives. Proof was obtained that the site usually considered the location of the circus where St. Peter was martyred, is incorrect.

**Constantinople.** To the Byzantine period belongs the newly excavated and restored 7th-century memorial church for the martyred Saint Euphemia (d. 307 A.D.) located near the Hippodrome. It was in the form of a hexagon with dome, and had perhaps been used earlier as a bath and later converted to a church in 616 A.D. Apse occur on five sides, the entrance on the sixth. In the eastern apse were benches for the clergy with altar and a rostrum facing them. The columns of the rostrum are adorned with mosaic work of green and red stone, a decoration hitherto unknown in Byzantine art. Important frescoes depicting the life of Euphemia occur on some of the walls.

**Bibliography.** Among important books of the year may be noted: Jack Finegan, *Light from the Ancient Past*, Princeton, 1946; George A. Reisner, *A History of the Giza Necropolis I*, Cambridge (U.S.A.) 1946; William Stevenson Smith, *Egyptian Sculpture of the Old Kingdom*, Cambridge (U.S.A.) 1946; David M. Robinson, *Excavations at Olynthus XII. Domestic and Public Architecture*, Baltimore, 1946; *Works of Art in Greece, the Greek Islands and the Dodecanese: Losses and Survivals in the War*, London, H. M. Stationery Office, 1946 (2 sh.); Gisela M. A. Richter, *Attic Red-Figured Vases—A Survey*, New Haven, 1946; *Les Mosaïques Chrétiennes primitives du IVe and Vle siècle: Rome, Naples, Milan, Ravennes*, (14 Pls. in color), Paris (Plon).

MARY H. SWINDLER.

**ARCHITECTURE.** As the war curtain gradually lifted it revealed a changed architectural climate. "Purism" with its devotion to clean forms produced by the most advanced methods of industrial technology, its aspiration toward a universal language rather than merely local or national expression, was threatened by the desire to have architecture "warmer," more intimate, more easily or even vulgarly "human." In the Soviet Union the town and regional planning, which had been highly advanced through central control of the land, began to be tinged by grandiloquence. In everyday work the architects accepted the leadership of the people instead of attempting strong leadership of their own, with consequences not all unfavorable. In Great Britain the new Government was determined upon vigorous control of all land uses and also upon a program of "greenbelt" or "garden" cities. The leading advocates of these were hostile to new architectural experiment and favored cozy nineteenth-century architectural settings. War-affected Scandinavian countries had responded variously. Holland's profession was torn into factions warring against one another. In Denmark where progress had been slow and cautious there was considerable promise of interesting architecture meeting the new postwar mood. In Finland the modern architects themselves, such as Alvar Aalto, were drawn closer to their people, re-explored the vernacular building and sought to apply their best skill and technics to arrangements rooted in common needs. Where formerly they had invented needs for the wealthy, they found that in the broader field their best role was rather to refine. France was torn, and those who were radical in politics proved not to be so in architecture. So Le Corbusier, the bold between-the-wars leader, was deprived of the long-sought chance to apply his broad town planning ideas to an entire city such as war-destroyed St.

Dié or St. Lo. The overwhelming desire of the inhabitants was to retreat again into the old atmosphere which seemed mystically related to past greatness and security, or at least to live by more familiar devices.

Because of his brilliant (but unaccepted) design of the twenties for the League of Nations Palace at Geneva, Le Corbusier was chosen consultant to the United Nations in their search for a capital somewhere on the eastern or western seaboard of the United States. At year's end much research had gone into drawing up requirements but no site was yet found. Le Corbusier's major triumph, in the meantime, was vicarious, through generous acceptance of his position by architects in South America in great executed works especially in Brazil.

European countries were developing plans for their devastated cities with the likely prospect that a great many would surpass in quality some of the planless urban aggregations of the United States. The very word "planning" had been so fiercely attacked, by those who considered the existing plan-devoted Government their enemy, that the United States seemed to be lagging behind in planning. The largest single project which promised to succeed at large scale was one covering seven square miles of slums on the South Side of Chicago. It was promulgated privately by the Michael Reese Hospital which, along with numerous other medical, educational, and industrial establishments, found its very existence difficult in its run-down environment. With great skill the hospital's staff enlisted the aid of all these groups and interests, also of Negro and labor leaders, for one of the few major practical schemes in the United States which have yet been predicated on democratic occupancy by mixed income groups and by all races. The plan retains only a few streets out of the prevailing gridiron plan, depends on big self-contained super-blocks developed freely with much interior green space, and has a rational plan for schools, community centers, shopping, recreation. The hospital (now 700 beds, 2,000 staff) will retain only one corner of the total development for its own campus, to be built in stages over twenty years. After the other institutions, such as Illinois Institute of Technology have done their part the remainder is to be developed residentially, in harmony with the master plan, about half by private enterprise, half by the Chicago Housing Authority.

**Residential Building.** The desperate need for homes of returning veterans for their new families led to the highly controversial "Wyatt program" with the stated aim of producing 2.7 million residential units by the end of 1947 through a combination of price control, priorities, stop-orders on "non-essential" building, and encouragement to manufacturers of prefabricated houses and other essential products. Concerted opposition from conventional builders who feared the development of a prefabrication industry, from developers who did not like to forego the far more lucrative opportunities from commercial building-materials manufacturers, and finally from some consumers held up in the ensuing black market, left nothing but a shell of the Wyatt program by year's end though the expeditor himself retired with a reputation for ability, energy, and integrity.

**Industrial Production.** This adverse trend affected some architecturally highly interesting developments, first among them a unique attempt at truly industrial house production by the ever-persistent inventor Buckminster Fuller. With the aid of Beech Aircraft Co. Fuller was able to produce a full-scale

model, of vast potential importance, differing as much from current "prefabrication" as it did from conventional building. The model was round in plan, having a 36-foot diameter; its streamlined dome radically diminished wind resistance, and, along with the construction method—using a thin insulated aluminum and plexiglass shell formed on three rings suspended from a central mast—permitted a radical weight reduction to 8,000 pounds total. (Equivalent space conventionally built might weigh some 14 tons.) Such light weight and small bulk would be highly important in transportation (materials for a complete house were to be shipped in a cylinder 16 feet long, 4½ feet in diameter). Critics invited to preview found the interior surprisingly spacious, the odd shape surprisingly unobtrusive, the one-piece copper bath rooms usable, accordion doors and revolving closet space convenient. The bet was long on science, on logic, on industrial efficiency and on public response to these; but at year's end the odds were against it. A much more limited step in prefabrication, involving only a combined kitchen, bathroom and laundry plumbing stack, was essayed by Ingersoll Steel & Disc Division of Borg-Warner Corp., which set up a 12-house test at Kalamazoo, Michigan, from designs by well-known residential architects Dow, H. H. Harris, Keck, Lankton, Stone, Stubbins, R. B. Wills, Yost. Among these perhaps the house by Stubbins achieved the clearest and most easily livable organization; that by Harris the most plastic interest involving the very effective use of clerestories, though the rooms were perhaps a little tight.

Among prefabricated house ventures one which promised very good architecture was that of General Panels Corp. whose well-proportioned set of standard interchangeable floor, wall, ceiling and roof panels made possible innumerable fresh arrangements by competent architects. This was designed by Gropius and Wachsmann, being given backing by Celotex Corp.

House groups erected by conventional builders and reported during the year included three inviting houses added just before the war to the Snake Hill group at Belmont, Massachusetts, outside Boston by Carl Koch, Huson Jackson, Robert Kennedy, architects; another charming group of six much smaller homes by Paul Schweikher, at Glenview, Illinois, in a cooperative development, also done just before the war but only now reported, showed how harmoniously modern planning with spacious opened-up interiors could be made to get along with a more conventionally conceived neighborhood, by virtue of nicely proportioned pleasant pitched-roof, large-chimneyed, somewhat romantic silhouettes, absorbing the large glass areas rather than showing them off.

As an individual house, the home of Mrs. Clarence W. W. Mayhew at Piedmont, California (suburb of Oakland) was one of the year's most distinguished. There were two parallel wings, one higher, one lower, on a hillside, the upper containing bedrooms, the lower the social quarters. Both presented open glass faces to the south and more solid walls to the passerby, were connected by an enclosed stair passage (virtually a covered garden path) in a manner that made the most studied use of trees and surrounding landscape in an intimate mingling of house and garden. (Clarence W. W. Mayhew and Serge Chermayeff, associated architects.) The same trend toward unostentatious but careful placing of the house in and against Nature was found in Pietro Belluschi's achievement at Natarts Bay, Oregon, with its easy

but firm forms and the beautiful wood surfaces inside and out. A small but charmingly domestic house, again well set, was done by John E. Dinwiddie, architect, and Garrett Eckbo, landscape architect, for the Floyd family at Walnut Creek near San Francisco. Two major trends were in the direction of landscape in architecture and architecture in landscape.

**Social.** Very little was produced because social institutions held back for the veterans' program with more conscience than stores and commercial ventures did. Through belated publication of results a shopping- and community-center for Bagley Downs housing project at Vancouver, Washington, by Pietro Belluschi, with its happy and unpretentious arrangement of community shops, meeting-room gymnasium, lounges and game rooms, nurseries, and various service facilities has only now come to public attention. A few schools were completed in part, notably the White Oaks and Sunnybrae elementary schools in San Francisco vicinity, both by Ernest J. Kump Co., both representing high excellence in child-scaled size, in structural simplicity, in clarity of concept and execution, in sunny commodious environment for growing citizens.

**Industrial.** Industrial work included little that was notable. The Benjamin Electric Co. at Desplaines, Ill., set up an illustration of the best kind of "public relations" procedure now current, in the form of a pleasant low-lying curved reception- and laboratory-building behind a pleasant lawn. (Perkins & Will, architects-engineers.)

**Commercial.** Commercial activity was lively despite its supposed interdiction except where essential. In stores a general trend was toward a rather slap-happy throwing around of the more novel architectural "motifs" in an effect either bizarre or baroque. A notable exception was the very fine conception and detailing of the Florsheim shoe store on Fifth Avenue, New York, by Ketchum, Giná and Sharp. The corner location permitted "open-front" gold-fish bowl treatment of the interior. The long inner wall of the store was canted in plan magnifying the perspective; the ceiling, all luminous through an over-all feathery egg-crate baffle treatment, was quietly exciting and was played skillfully against other large surfaces, textured and patterned with originality and restraint. The detailing of all joints was beautifully thinned. In the opposite trend some floors of Martin's department store in Brooklyn, by Morris Lapidus—plan of counters and alcoves, with inlaid linoleum murals, tessellated glass mosaic columns, illuminated windows scattered in the ceiling, actively patterned furniture and fixtures, all were calculated to catch direct, and even throw the attention hither and yon. Airline offices were handsomely handled in many cases, notably Western Airlines at Los Angeles (H. Roy Kelley, arch., Wm. O. Goodwin and Burwell Hamrick, associated) with a really clever doublecanted glass front to eliminate the usual street reflections; and Eastern Airlines at Boston (Marcel Breuer and Hugh Stubbins, arch's) where projecting, ceiling beams and wall protrusions of the existing structure were cleverly masked by wavy, ribbed plaster forms artfully recalling airplane conformations. A wholly different kind of achievement was Amster Yard, New York, two doors from the famous early modern house of Morris Sanders, where echoes of the French 18th century were evoked with considerable chic and chi-chi by Harold Sterner, architect. Bravura in showmanship was achieved by Carson & Lundin in Rockefeller Center NBC

Broadcasting studios, with the round plaster blobs and zig-zag ceilings used for acoustical control.

At a much higher level, a triumphantly successful display was the exhibition of the art of the South Seas set up under direction of René d'Harnoncourt at the Museum of Modern Art, New York. An extraordinarily evocative use of dim light and color not only made the show a satisfying succession of stimulations but suggested the varying jungle or open-air atmospheres under which the works were originally created.

**Central and South America.** As reported in *Architectural Forum*, Mexico City underwent an unlimited building boom, throwing together hotels, apartment houses, office buildings, factories at a speed "exceeding the Florida land boom." Design was chiefly an exterior addition, following largely on earlier North American and European "modernistic" models, with some addition of fake Spanish re-imported from above the line as "California style."

In Colombia the same boom conditions have obtained. New office buildings in the capital city of Bogotá have been crowded on donkey-wide streets, competent example being a white stone-veneered six-story building by Cuellar, Serrano & Gomez, architects also for some pleasant modern city houses and a drugstore that would be exemplary for any United States city. The National University shows strong influence of Le Corbusier and Continental European modes in individual buildings of two decades past; but the general plan is a rather monstrous curvilinear Beaux-Arts concoction. Venezuela's socialistic government has applied some of its income from oil operations to the pride of Caracas, the capital, the El Silencio housing project begun 1942, housing 4,000 tenants in seven-story row-apartments, rather tightly placed but roomily planned, with relief from the gross monotony attending North American projects of similar size through balconies. It is nicely composed though with a quaint incongruous traditionalistic arcade at street level. (Carlos Raul Villanueva, architect.)

Here, too, university life is politically of great importance, and the National University City has been begun outside Caracas in a splendid mountain setting under monumental plans. A sumptuous hotel in the capital is the Avila, done by the United States firm of Harrison, Foulhoux & Abramovitz.

A highly ambitious project under construction in Brazil is the Cidade dos Motores, a town for 25,000 above Rio, for which the North American firm of Paul Lester Wiener and José Luis Sert were planners and the Brazilian Otto da Rocha e Silva the architect and builder. Of world-wide importance, this represents a culmination of single-stroke made environment at large scale, in the planning and architectural language of Le Corbusier (as opposed to the approach which lets a town grow through many hands under the loose guidance of a master plan). The careful grouping of units large and small, in rows and singly, woven against the green of natural surroundings, is of great and exciting plastic richness. The individual tall apartment buildings, low-lying row-houses, buildings of all kinds are designed in large standardized wall units capable of great variation making up into colorful geometric patterns and including strong light and shade through plastic components such as the many kinds of sunbreak grills. Of quite different effect was the very fresh and perfectly extraordinary Chapel of St. Francis at Pampulha by Oscar Niemeyer, architect, and Portinari, the painter.

In the British Commonwealth, while the mother country gathered and disciplined itself for a desperate struggle for revival, dominions were more free. Australia had the great Heidelberg Military Hospital to show for the war, carefully planned for peace also (Leighton Irwin & Co., architects-engineers); New Zealand her public housing of supremely good quality within this genre in the form of large blocks of flats, ten stories high but still giving the effect of private dwellings gathered together (Gordon F. Wilson, supervising architect). India called in some American architect- and engineer-experts on large projects.

Everywhere in Europe preliminary clean-up and groundwork was in progress for the grim reconstruction. In cities such as Warsaw, where planning had gone forward right in the underground, there were ambitious up-to-the-minute plans for a forty-mile-long city, built up in orderly procession out of residential colonies (the basic cell), then neighborhoods, districts, boroughs; planners such as Szymon Syrkus had by the most ingenious stratagems kept themselves survivors of extermination camps with this single-minded purpose.

DOUGLAS HASKELL.

**ARGENTINA.** A republic of South America. Area: 1,079,965 square miles. Population: 13,906,694 (1943). Capital: Buenos Aires.

Argentina is the second largest of the Latin American republics. Two-thirds of its surface consists of plains; the remainder, of the Andean highlands extending north and south along its western frontier. A temperate climate prevails in most of the country, although low-altitude areas of the northwest are sub-tropical and southern Patagonia is cold, with snow falling the year around in Tierra del Fuego.

**Government.** Under the Constitution of 1853, a federal union of 14 provinces and 9 territories was established. The Constitution provides for a bicameral legislature composed of a Senate of 30 members, elected by provincial legislatures for 9-year terms (one-third to be elected every 3 years), and a Chamber of Deputies of 158 members directly elected for 4-year terms (one-half to be elected every 2 years). The President is chosen by electors for a 6-year term, and cannot immediately succeed himself. He is to be assisted by a Cabinet of 8 members. Provincial governors are elected by local suffrage.

President Ramón S. Castillo was overthrown by a military coup on June 4, 1943. General Pedro P. Ramírez assumed the presidency on June 6, 1943, and he was succeeded by Brig. Gen. Edelmiro J. Farrell on Mar. 10, 1944. The Congress was dissolved shortly after the 1943 revolution, and political parties were abolished.

**Events, 1946.** At the outset of 1946, Argentina constituted a focal point of diplomatic and political interest for the Western Hemisphere and Europe. The Presidential and Congressional elections scheduled for February 24 presumably were to decide whether the Argentine Government would cling to its rightist politics, the course followed during World War II, or veer toward political liberalism.

The candidate who would be the leading one in the elections was recognized to be Colonel Juan D. Perón, Vice-President in the current Government of General Edelmiro J. Farrell until his acceptance of the Presidential nomination and leadership of the Colonels clique, a powerful military group with ambitious political interests. Often accused of fostering Fascist ambitions and cooperating with South American nazis, Colonel Perón enjoyed the

support of the *descamisados*, "the shirtless ones," the population on the lowest economic level to whom he had promised higher wages, increasing governmental benefits, and land from the holdings of the wealthy classes.

Opposing Perón was Dr. Jose Tamborini, Radical, former Senator and Minister of the Interior in the Alvear Cabinet (1925-28). Tamborini was selected in early January as the coalition candidate of the Democratic Union, composed of Socialists, Communists, Progressive Democrats, and Radicals. Except for a minority intransigent wing of the Radical party, the political opposition to Perón was solidly behind Tamborini.

The character of the campaigns, as they approached their climax, was tense, acrimonious, and violent. On January 9 Minister of the Interior Urdapilleta issued a warning to Presidential and Vice Presidential candidates that the Government might revoke its permission for uncensored radio broadcasts. The warning was made after Tamborini's running mate, Enrique Mosca, said in a broadcast that he had heard that the opposition was organizing "shock groups," including "Nazi-Fascists," born both in Argentina and abroad.

During the weeks preceding the election date, other events illustrated the national and international issues behind the program of the Farrell regime, of which Colonel Perón was conceded to be the power, and the future program of Colonel Perón, if he were to be elected President. All Argentine employers decided to institute a three-day nation-wide lockout beginning January 14, in protest against the application of a Government decree issued on December 20, 1945, providing general salary increases ranging from 10 to 25 percent and a year-end month's bonus for all employees. The move was more political than economic; most employers paid the increases and bonuses, but objected to the right of a de facto Government to impose such a burden without Congressional consent. Furthermore, the employers interpreted the Perón-inspired decree as a bid for the workers' votes. The Assembly of Argentine Industry, Commerce, and Production executed the lockout thoroughly and peacefully, and stated they would enter discussions directly with the employees. Spokesmen for the organization reiterated the employers' refusal to recognize the validity of the decree, especially with its provision forcing employers to contribute toward the support of the Government bureau that dealt with labor unions.

The United States indicated its attitude toward the wartime Argentine regime on January 17 when the Embassy in Buenos Aires released factual evidence allegedly proving the secret connections that formerly existed between the German Embassy in Buenos Aires and many Argentine newspapers. Photostatic copies of thirteen telegrams sent by the German Embassy to the German Foreign Office showed that subsidies had been paid to the newspapers, which also had received aid in the form of newspaper allotments from the Government of President Ramón S. Castillo. Within a week of the Embassy report, the Government informed newspaper importers that they would have to place six hundred tons of newspaper at the disposal of *Epoca*, *Tribuna* and *Democracia*, leading supporters of Perón's candidacy.

Though the telegrams, with one exception, referred to events that took place before the revolution of June 4, 1943, their contents were timely because several of the once-subsidized newspapers still existed, while others had transferred many of their staff members to newspapers actively sup-

porting Perón. According to the Embassy evidence, German funds had subsidized *Tribuna*, *Pampero*, *Ahora*, *Deutsche La Plata Zeitung*, the still active *Pueblo* and *Cabildo*, the predecessor to *Tribuna*. The financial negotiations, the Embassy report said, had been conducted by Antonio Delino, formerly Buenos Aires agent for the Hamburg-American line and until November, 1945 one of the directors of an Argentine bank.

The campaign tours of both Presidential candidates were accompanied by violence and candidate Perón and his party had several narrow escapes from injury.

On February 24, twenty days before the elections, the Argentine Supreme Court ruled that the powerful regional offices of the Secretariat of Labor and Social Welfare, organized two years earlier under Colonel Perón, were unconstitutional since they violated rights belonging exclusively to the Provincial Governments. After the creation of the Secretariat, Colonel Perón outlawed many of the old-line unions, set up new unions and used the various regional offices as cores of the Labor Party, the mainstay of his support.

In the face of his earlier attacks on Spruille Braden, United States Assistant Secretary of State and former Ambassador to Argentina, and his repeated condemnations of "Yankee imperialism," Colonel Perón neatly swivelled his policy on February 9 and, in a 4,000 word document, declared that Argentina must seek closer relations with the "great northern nation." After inviting American capital and technicians to "develop and strengthen our progress," Colonel Perón explained his concept of Argentina's foreign policy: "It should be a fundamental task of the future Argentine Government, as I understand it, to foster a high policy of intelligence with the United States, establishing a balanced formula of sympathy and interest between the two countries, encouraging effective and mutual comprehension and dissipating the reservations presently hampering a true understanding." The statement, offered for United States consumption, was not released to the Argentine press.

On February 12, the same day that Colonel Perón formally accepted the candidacy for President and charged Mr. Braden with interfering in Argentine internal affairs and organizing resistance to the existing military Government, the United States Department of State issued the 131 page *Blue Book*, an indictment of Argentina's relations with Nazi Germany. The memorandum, entitled *Consultation Among the American Republics With Respect to the Argentine Situation*, charged that Argentina (1) not only supported the German war effort after Pearl Harbor, but continued to give active aid after Argentina's declaration of war on Germany; (2) at the time of the *Blue Book's* publication, protected powerful Nazi interests seeking a resurgence of world-wide Nazism; (3) formed with Nazi groups a neo-fascist state; (4) plotted to obtain war materiel from Germany via Spain in exchange for critical war materials shipped to Germany through Spain. Colonel Perón, President Farrell, and former Presidents Pedro P. Ramírez and Ramón Castillo were cited in the memorandum as agents who sought to form a Nazi anti-United States bloc in South America.

"In Argentina," the memorandum said, "the Germans have constructed a complete duplicate of the economic structure for war which they had in Germany. They possess today in Argentina the economic organization—industrial, commercial, and agricultural—which they need to provide a base for the reconstitution of German aggressive power

during the period when the homeland is still occupied."

The memorandum outlined the difficulties faced by the United States and Great Britain in obtaining the expulsion from Argentina of many known German agents. Until January, 1946 none had been deported, although the Argentine Foreign Minister assured the Department of State that he hoped to repatriate as many as forty agents. As for the current situation, the *Blue Book* accused the Argentine Government of sheltering German economic interests, adding that the sequestration of German firms and assets following Argentina's declaration of war had merely provided a convenient refuge for them.

In Argentina the *Blue Book* explosion was met by consternation in the anti-Perón press and vehement denials in the Peronista press. On February 14 Colonel Perón retaliated to the *Blue Book* by accusing Mr. Braden of heading a vast spy ring and financing political campaigns in Argentina by extracting money from Argentines in exchange for the removal of their names from the blacklist. He further stated that a former United States military attaché, Brig. Gen. John Lang, had been expelled from Argentina by the military Government. In a broadcast on the same evening, Foreign Minister Juan I. Cooke claimed that the *Blue Book* charges were false and represented interference with the coming February 24 elections.

On February 22 Colonel Perón continued his reply to the *Blue Book* by releasing a *Blue and White Book*, a 127-page memorandum accompanied by photostatic copies of six documents, purportedly proving that Brig. Gen. Lang and several former Embassy officials had engaged in espionage activities. The document stated that Mr. Braden betrayed the Good Neighbor Policy and attempted to establish a puppet Government in Argentina.

Although the publication of the *Blue Book* was undoubtedly timed to influence the elections, most circles in Washington and Buenos Aires were dubious about its actual power. It was felt that the *Blue Book* revelations would sway only a small minority of voters because of the wide breach that existed between the two unalterably-opposed candidates. Actually, Colonel Perón used the *Blue Book* as political credit, accusing the United States of dabbling in Argentine politics and supercharging the nationalistic spirit of his followers by declaring that a vote for Tamborini was a vote for Braden.

On February 19 the Argentine Army, Navy, and Air Force took over the job of insuring an honest election. Military commanders also assumed jurisdiction over the Federal police and the local police in the fourteen provinces. Their power was to end on the day after elections and thereafter they were to guard the ballot boxes until the tabulation was completed.

Contrary to expectations of fraud and disturbances the election on February 24 proved to be the most orderly and peaceful in Argentina's history. By the first week in March all parties conceded Perón's victory. The count showed 1,479,000 for Perón to Tamborini's 1,210,000, a plurality of about 20 percent. The distribution of votes, however, gave President-elect Perón an electoral landslide of 304 to 72. Candidates running on the Perón ticket won the governorships in all fourteen provinces and a majority of 109 to 49 in the Chamber of Deputies. The bulk of Colonel Perón's votes was given by the industrial and agricultural workers.

The weight of President-elect Perón's influence was felt during March 1-23 in a national meat-

workers' strike which held up the shipments of 75,000 tons of meat to Europe. The 60,000 packing house workers belonging to a Peronista union struck for improved working conditions and enforcement of the famous December 1945 decree which provided for higher wages and the year's end bonus. The nine meat-packing houses, all owned by Anglo-American firms at first refused to make the payments but finally complied with the union's demands. During the first week of the strike the Communists, who had vigorously opposed Perón during the election campaigns, swung in behind the packing house workers and supported the union's demands.

On the same day of the strike settlement, the Supreme Court decided that the pay raise and bonus decree were unconstitutional on the basis that the Government's legislative powers were limited to emergency cases, a condition that did not exist at the time of the decree.

The United States underscored its policy toward a Perón regime in Argentina when on March 21, it informed all Latin American countries with the exception of Argentina that it would not sign any treaty for the maintenance of peace or hemispheric security if the Argentine Government, headed by President-elect Perón were to be one of the signatories. The formal statement met with a somewhat negative reception in Latin American capitals. Most of the apathy was founded on the fact that the declaration was impotent since the Rio de Janeiro Conference, originally planned for March, had been indefinitely postponed and furthermore, the statement was incompatible with the position of the United States at the San Francisco Conference less than a year previously, when it had forced the admission of Argentina into the United Nations.

The nationalization of the Central Bank of Argentina was decreed suddenly on March 25 by President Farrell as the Government reached the limit of its legal borrowing power with that agency. Organized in 1935 to control currency and international exchange rates, the stock of the Bank was held by the Government and private interests with a large portion owned by foreign banks. A few weeks prior to the decree, the Bank had issued a report sharply criticizing the Government's spending program. The Government announced that the express purpose behind the decree was to unify and correlate the principles of the State's political economy with the monetary policy. Nationalization eliminated the restriction which permitted the State to borrow no more than a tenth of its average revenue from the Central Bank. By taking over the Bank, the State was given "its sovereign right to issue money" and the right to borrow sufficient money to meet its needs.

The tenor of Argentina's replies to the *Blue Book's* allegations abruptly changed on March 29 when appeal was made to the United States not to prolong the inter-American crisis that had arisen from the charges of Axis collaboration. Issuing the report on the day after the confirmation of Perón's victory, the Argentine Government said that it had fulfilled all international commitments and that the victory of Perón in a democratic election refuted the charges of totalitarianism. Calling for a return to friendship and cooperation, the memorandum stated that the issues at stake were clarified by the election and the situation demanded a return to Rooseveltian harmony. The reply was delivered to all American diplomatic missions, except the United States.

The nature of the February elections and the re-

luctance of several American republics to accept the *Blue Book* in toto caused the United States to shift its attitude towards Argentina. In April United States Secretary of State James F. Byrnes declared that the United States, in concert with the majority of the Republics of the Western Hemisphere, was willing to participate with Argentina in a hemispheric defense treaty, providing that the new Perón Government relieved Argentina of "Axis influences" that threatened the security of the inter-American system. It appeared that a majority of the members of the Pan American Union, led by Brazil and Chile, persuaded the United States to give the new Argentine Government an opportunity to show good faith and break the deadlock that threatened to forbid any future hemispheric conference. In reference to the Axis influences, the statement said that "Were such unequivocal and sustained performance to ensue, the road would be open to that complete unity of the peoples of America," and the negotiation and the signature of a mutual assistance pact. But there must be deeds and not merely promises."

On the following day Argentine Foreign Minister Juan Cooke gave the statement a cool reception, pointing out that Argentina had already complied with her agreements on the Mexico City conference. Further repudiation of the *Blue Book* charges came on April 17 in a statement calling "absurd" any prolongation of the *Blue Book* dispute. Hoping for early resumption of good neighborliness, Dr. Cooke wrote that the Argentine Government has as "its firm purpose to maintain its traditionally pacifist ideals and its unequivocal democratic faith."

Conceding that Argentina had, and probably still has, some totalitarian sympathizers, as does have every country in the world, Dr. Cooke said that Argentina's policy of neutrality might have been wrong, but that it was the expression of the people's will. There were German spies in Argentina, he admitted, as there were in the United States during the war. He referred to I. G. Farben, "one of the most powerful world trusts, . . . which in the direct service of Nazism penetrated into all the circles of that country [United States]."

The Government absorbed the remainder of Argentina's banking system by decree on April 24 when it placed the entire banking system, including private deposits (totalling eight billion pesos) under the Government's control. The decree established a rediscount and control system that enabled it to withhold loans from any individual or institution, making possible the government's strict control over the nation's economy. The decree's provision that limited loans by private banks to the amount of their capital seriously curtailed the activities of foreign banks.

The government's decree nationalizing the autonomous universities of Argentina on May 4 met with a flurry of protest from students and teachers. As Federal interventors took over the direction of six major Argentine universities, police detachments were strengthened and orders issued prohibiting student meetings on the campuses. The National Radical party, a close second to Perón's party in the elections, charged that the Peronistas were using the de facto Government and the state of siege to violate laws openly and to make basic changes that would later be legalized by the strongly Peronista congress.

On June 4 while a million people cheered in the streets, Juan D. Perón was inaugurated as the twenty-ninth President of Argentina. In his inaugural speech he pledged to maintain Argentina's

sovereignty, promised to maintain the country's institutions, traditions, and system of free enterprise, and called for legalization and implementation of the military government's social reform and labor program.

The new cabinet, sworn in after President Perón, was as follows: Interior, Angel C. Borlenghi; Foreign Affairs, Juan A. Bramuglia; Finance, Ramon A. Cereijo; Justice and Education, Belisario Cache Piran; Public Works, General Juan Pistarini; Agriculture, Juan C. Picazo Elordy; War, General Humberto Sosa Molina; Marine, Navy Captain Fidel L. Anadon; Aviation, Air Brigadier Bartolome de la Colina Public Health, Ramon Carrillo; Industry and Commerce, Jose Maria Freyre.

Two days after his inauguration President Perón established diplomatic relations with the Soviet Union after twenty-eight years of non-recognition between the two countries that had begun with the Bolshevik Revolution.

The economic tension between Argentina and the United States grew somewhat relaxed on June 25 when Foreign Minister Juan A. Bramuglia announced that the United States Government had agreed to release \$600,000,000 in "frozen funds" held by the Federal Reserve System during the war when it was thought that Nazi Government officials might be transferring funds to Argentine banks. The move was attributed to United States Ambassador George S. Messersmith, appointed to Argentina in April.

In his first address to the business session of Congress on June 26, President Perón put before the legislature the job of deciding on the approval of the Mexico City continental-solidarity and San Francisco-United Nations agreements, and pointed out that the recent release of Argentine funds in the United States did not alter his attitude that the matter was purely a Congressional concern. His address called for an investigation of the Argentine press, women's suffrage, the semi-socialization of medicine, free university education for the deserving poor, an expanded merchant fleet, increased selective immigration, aid for the would-be small land owners, a minimum-wage law, and a program of agrarian reform.

Another change in President Perón's position was visible in his remarks to a private session of the majority bloc in the Chamber of Deputies on July 17 to the effect that if another war broke out, Argentina would participate on the side of the United States. The statement was a decided shift in policy and the most noteworthy overtone in the direction of the United States made by President Perón. The local newspapers in a report of the speech also attributed to Perón an attack on the British attitude, urging that Congress make no motion to renew the Runciman Treaty granting Great Britain special trade benefits, which was to expire on August 20.

The alleged speech brought no comment from diplomatic circles. The Washington representatives were apparently waiting for action on the approval of the Chapultepec agreement, the deportation of Nazi elements to Germany for trial, and the recent demand for the expulsion of 100 German Nazi school teachers still free in Argentina. On August 1 President Perón publicly aired his closed-door pro-United States statement and declared, "Argentina is an American country, placed geographically in the American continent, and consequently my country forms an integral part of what might be called the 'American line.' We all know that there is the potential danger of other conflicts and if, unhappily, the statesmen of the world cannot prevent

it, Argentina will be found ranged alongside of the United States and the other American nations." He ridiculed the contention that Argentina was trying to erect an anti-United States bloc and stressed the necessity for Congressional ratification of Chapultepec agreements. Deploring the deterioration of Argentine-United States relations, he said that the three points of issue—enemy schools and institutions, enemy business concerns, and undesirable enemy residents—were being quickly eliminated by the Government.

Ratification by the Argentine Senate of the Act of Chapultepec and the United Nations Charter on August 19 was effected as crowds in the streets and spectators in the galleries of the Senate demonstrated against the unanimous vote of approval. When the problem of ratification came up before the Chamber of Deputies on August 28, a necessary two-thirds majority was three votes short of bringing the matter on the agenda and the issue was postponed indefinitely.

Ratification by the Senate of the two agreements caused a rift in the Perónista parties. President Perón had been supported in the elections by extreme nationalists who feared that any pact would endanger Argentine sovereignty. Despite the disapproval of this strong element among his backers and the refusal of the Radicals to vote for a Perón-sponsored act, President Perón made his power felt in an all-night session of the Chamber of Deputies on August 30 by forcing passage of the two measures. On the following day Foreign Minister Juan A. Bramuglia said that Argentina had begun steps that would warrant her full acceptance in the international postwar society, asserting that all Nazi industries were being eliminated, German and Japanese schools had already been dealt with, and the Argentine courts were disposing of the question of Axis nationals. The intense nationalism in Buenos Aires that followed the approval of the two international pacts resulted in the police's silencing of the vigorous anti-United States Nationalist Liberating Alliance on September 1 for "repeated resistance to authority."

One of the largest German-owned firms in Argentina, the Sieman-Schuckert Electric Company, was ordered returned to its owners by a court decision on September 20. The seizure of the firm by the Government was disapproved by the Supreme Court which ruled that the inviolability of property was based on the Constitution. In the face of this ruling, Foreign Minister Bramuglia announced that the Government would order the nationalization or liquidation of fifty Axis firms by the end of October. Declaring that the Government was determined to carry out the Chapultepec pledges, Dr. Bramuglia said that of the ninety-eight Axis agents requested by the Allies, twenty-five had been repatriated, thirty-nine were under trial, seven had their Argentine citizenship removed, and eight cases were under study. Six others were fugitives and three were in prison for other offenses.

On October 30 Ludwig Freude, rated by the *Blue Book* as the leading Nazi in Argentina, was completely absolved by Presidential decree of all espionage charges and all of his seized properties and funds were ordered returned to him.

The Supreme Court of Argentina during 1946 often hampered many of President Perón's measures and proved a constant rein on his plans for the nationalization of Argentina's economy. The pro-Perón majority in the Chamber of Deputies began a debate on September 18 to impeach four of the five members of the Court on the charge that the Court failed to do its duty when it recognized

the legality of two de facto Governments in 1930 and 1943. After an all-night session, the motion was passed by a 104 to 47 vote. Resolution was also passed to enlarge the judicial body. The anti-Perón press in Argentina asserted that the procedure was a totalitarian move to centralize control of the judiciary in the executive's hands, while the pro-Perón organs said that the move was Rooseveltian and the Court was ultranationalistic and reactionary.

The blueprint of an ambitious five-year plan for the industrialization and economic development of Argentina was presented in the form of twenty-seven bills by President Perón to a special session of Congress on October 21. Scheduled to start functioning by January 1, 1947, the plan intends to revamp Argentina's entire economy and penetrate to "every department of Argentine life, from the three angles of Government, national defense, and general economy."

Along with an accelerated industrialization program, the plan includes reorganization of the Government, increased official control over the nation's economy, reorganization of the transportation system; unprecedented schemes for irrigation and colonization; elaborate extension of the roads system; intensification of foreign commerce; an extensive program of technical education; and reorganization of the consular and diplomatic corps. Financed by bonds and other means at an estimated cost of \$1,665,000,000, excluding military expenditures, the plan seeks a 43.3 percent increase in industrially-derived income over the 1943 figure, 50.8 percent increase in industrial wages and salary, a 30 percent increase in the number of workers and a 50 percent increase in power installations.

The complete modernization of the armed forces is to be accompanied by the construction of military factories. The plan envisions the educational system under Presidential control with the rectors of all universities named by the President. A \$156,700,000 public works program, employing estimated hundreds of thousands of workers, calls for the construction of hospitals and clinics and semi-socialization of medicine, under which free medical assistance will be given those unable to pay. The Government will control, distribute and establish prices for grains and oil-producing vegetables and seeds. The Government would make drugs and sell them at cost. Women would be permitted to vote.

Denying charges that the plan was totalitarian, President Perón labeled it "constructive democracy, with a better balance between the individual and the state." On November 16 the Senate approved the plan's first two bills, one providing for the creation of a body of state's attorneys, which will carry on all Government legal matters, and the other enfranchising non-commissioned officers of the armed forces.

On November 29 a conscription bill, making all Argentines between the ages of twelve and twenty subject to army and navy training at Presidential discretion, was passed by the Chamber of Deputies and forwarded to the Senate. The bill provided for the compulsory military service of all men between the ages of twenty and twenty-two and the creation of an auxiliary service for women, subject to peacetime call. The over-all provisions of the bill gave the Government the power to conscript all persons between the ages of twelve and fifty for peacetime military service.

**Relations with the United States.** Argentina's relations with the United States suffered constant strain during 1946. In reply to the *Blue Book* charges (see above) and the repeated direct and

indirect statements of Mr. Braden in reference to "Argentine fascism," Presidential candidate Perón accused the United States with complicity in the smuggling of arms from Uruguay to Argentina. The United States Department of State questioned the charge and requested the Argentine Government under President Farrell to endorse or repudiate the accusations. On February 13 Senator Joseph F. Guffey of Pennsylvania called for an immediate severance of relations with Argentina.

Despite the critical state of relations, the United States continued to send shipments of tires, farm machinery, and other equipment to Argentina. United States Secretary of State James F. Byrnes explained in mid-February that the shipments were necessary to facilitate the movement of wheat to the Argentine seaboard and thence to Europe for much needed relief.

The vacant ambassadorship that existed in Buenos Aires after Mr. Branden departed late in 1945 was filled in April by George S. Messersmith, former Ambassador to Mexico. The difficult diplomatic task facing Ambassador Messersmith was evident during the Presidential inaugural ceremonies in Buenos Aires when the Ambassador and his party were vigorously "booed." In his first address in Argentina on July 4 the Ambassador called for the wholehearted cooperation of Argentina in the United Nations and Pan American systems and expressed the wish that Argentina cease delaying food shipments to Europe.

At the time that Ambassador Messersmith was attempting to further a mutual understanding between his country and Argentina, General Carlos von der Becke, retired wartime Argentine chief of staff, made an extensive visit to the United States. Although his visit was publicly announced as "unofficial," the consensus of opinion among newspaper writers in Washington was that the General proposed to present evidence proving that Argentina was purging herself of Nazi influences and hoped to establish the basis for a United States military mission to train and equip the Argentine army.

Dr. Oscar Ivanissevich, intimate of President Perón and prominent Buenos Aires surgeon, arrived in Washington on August 15 to take up his duties as Ambassador. A few weeks after his arrival, Dr. Ivanissevich portrayed the Government of President Perón as one "struggling for the same democratic principles which were found on the banner of President Roosevelt: 'Every man a man, not an outcast, nor a slave.'" Late in August the Ambassador extended an invitation to United States labor leaders to visit Argentina to observe the functioning of labor unions.

The issue surrounding the supplying of arms and the signing of a military pact with Argentina, strenuously opposed by Assistant Secretary of State Braden, was clarified on October 22 by Secretary of State Byrnes. Coming to the aid of Mr. Braden, whose irrevocable stand had caused rumors of his resignation, Mr. Byrnes reasserted the policy of April 8, calling for deeds, not promises. As soon as President Perón acted on the elimination of key Nazi agents and businesses in Argentina, Mr. Byrnes said, the United States and other Latin American republics would proceed with the Rio de Janeiro conference at which the hemisphere defense pact would be signed.

President Perón entered the internal political scene of the United States on November 28 when Andrew J. Higgins, war-renowned New Orleans shipbuilder, admitted that he had joined President Perón in agitating for the removal of Mr. Braden

from the Department of State. Knowledge of this was revealed by the publication of two letters sent by Mr. Higgins to Senator Tom Connally, Chairman of the Senate Foreign Relations Committee. One letter was written by President Perón to Mr. Higgins; the other, an accompanying letter, was from Mr. Higgins to Senator Connally. President Perón's letter characterized Mr. Braden as a "fifth column" impeding friendly relations between the two countries and suggested that his "disappearance" from American politics would solve the problem. In Mr. Higgins's letter, the Perón administration was praised and declaration was made that "the long-built-up 'good neighbor policy' had been knocked to hell" by Mr. Braden.

**Relations with Great Britain.** Except for Great Britain's support of the *Blue Book*, Argentine-British relations were essentially economic. Great Britain depended on Argentina for one-third of her meat supply, half of her shoe leather, and considerable quantities of grain. In addition, British interests held nearly \$800,000,000 in Argentine investments, mostly railroads. Argentina, on the other hand, held at least \$520,000,000 in war-accumulated credits in Great Britain.

The arrival late in June of two British economic missions, headed by Sir Percival Leisching, Second Secretary of the British Board of Trade, and Sir Wilfrid G. Eady, ranking British Treasury official, indicated the importance to Great Britain to make arrangements which would insure her obtaining the necessary consumer goods from Argentina and, at the same time, to arrange markets for her post-war manufactured exports.

On September 17 an Anglo-Argentine trade agreement was concluded, providing for a 7.5 percent increase in the price of beef; permission to Argentina to convert British money spent in Argentina into dollars or any other currency; the release of gold which the Bank of England was holding to the credit of the Banco Central de la Republica Argentina and the creation of a new joint Anglo-Argentine company to take over British-owned railroads and pay British stockholders with new stock issued at like value by Argentina. Of Argentina's credits in Great Britain, \$20,000,000 was scheduled to be freed annually for four years. It was anticipated that the remainder of the blocked sterling would be used to repatriate sterling debts on British investments in Argentina. The agreement also stipulated that Argentina could transfer \$40,000,000 in sterling to Brazil. By the trade pact Great Britain retained her position as chief purchaser of Argentine beef, drawing on 87 percent of Argentina's surplus during the first year and 78 percent during the second year.

In mid-December President Perón presented a gift of 15,000 tons of meat, valued at \$3,482,000 to the British people. Offered as a Christmas token of friendship, the gift enabled the British Food Ministry to give a rebate to all Britons holding ration books.

**Other Relations with Europe.** Relations with the Soviet Union were generally limited to diplomatic ties. Trading between the two countries, aside from one shipment of linseed oil, was limited to the preliminary stages of negotiations.

Less than three weeks after the Labor party, headed by President Perón, issued a rebuke to Spain on March 9 for the execution of persons described as pro-liberal and a bomb was thrown against the Spanish Consulate on the same day, the Argentine Government granted a \$7,500,000 credit to Spain. The Argentine Foreign Office explained that the loan was consistent with the

policy of aiding those countries whose economy was disrupted by the war. On October 30 Argentina signed a trade agreement with Spain, providing for the sale of wheat, corn, and edible oils in exchange for Spanish steel and other metals. The pact granted Spain a revolving credit of approximately \$87,500,000 as a purchasing fund.

**Latin American Relations.** Argentina established with Chile on December 14 a commercial treaty that firmly locked the economies of both countries in far-reaching agreements. The treaty eliminated tariff barriers on vital products and provided a loan of about \$148,000,000 for Chile. Argentina was given an outlet to the Pacific Ocean through Valparaiso, which was named a free port, and large allotments of much needed coal and copper nitrates. The economy of Chile was bolstered through credits and assurance of a food supply from Argentina.

On October 25 was negotiated between Brazil and Argentina a five-year-barter pact which provided Brazil with Argentine wheat in exchange for crude and manufactured rubber, cotton textiles and yarn, lumber, and pig iron. Effective January 1, 1947, the agreement committed Argentina to supply Brazil with annual shipments of 1,000,000 tons of wheat, providing the exportable surplus is not less than 2,600,000 tons. If the surplus is less, Brazil will receive 45 percent of the surplus. Brazil promised to send Argentina its entire exportable surplus of tires, 3,000 tons of crude rubber in 1947 and 5,000 tons in each of the succeeding four years, 60,000,000 yards of cotton textiles in 1947 with increased shipments during the succeeding years, a billion square feet of lumber over the five year span, and an annual minimum of 15,000 tons of pig iron.

**Economic Development.** As one of the few nations that emerged unharmed from the war, Argentina entered the postwar world as one of the two nations, with the United States, capable of acting as a "giver" of meat and grain to a hungry world. In March, however, Argentina's financial program was criticized in the annual report of the Argentine Chamber of Commerce. Accusing the Government of using a 1945 budget that exceeded total revenue—revenue 1,355,000,000 pesos, expenditure 2,849,000,000 pesos—the report pointed out that improvement in public works, public health, and education were in no way commensurate with the expansion of military establishments.

President Perón's nationalization efforts, that began with banks and universities, was extended on April 17 to food exports. A wheat subsidy of five pesos per 220 pounds was provided for the growers while a fund of \$31,000,000 was established to assure millers of cheap wheat for the domestic market. The move was intended to bring wheat out of hoarding for shipment abroad and to encourage wheat planting which had declined during the war. On August 30 the Government issued a decree establishing itself as the sole agent for Argentina's \$350,000,000 annual meat exporting industry. Later, in September, the Government established control over quebracho extract, casein, cheese, butter, potatoes, sugar, vegetables, fats, and onions.

The nationalization of Argentina's economy was given further fact on November 30 when the Central Bank imposed controls on imports of all machinery by requiring licensing. This order reinforced the five-year plan which required only those imports that fitted into its program. According to the Central Bank's announcement, complete authority over machinery imports was placed in

the Argentine Institute for the Promotion of Interchange, which also controlled exports. The principal objective of the order "was to favor the use of monetary reserves accumulated abroad by this nation during the war preferentially in the purchase of mechanical equipment necessary to replace outworn machinery and to increase industrial production." The order also stated that "imports on items produced in Argentina will not be permitted."

The 14,000,000 population of Argentina proved a strong curb on President Perón's plans for a highly industrialized nation with equitable developments in other aspects of the economy. To alleviate the manpower shortage, Dr. Santiago M. Peralta, Director of Migration, outlined on August 14 a fifty-year plan to increase the country's population to 100,000,000. President Perón's five-year plan called for 50,000 immigrants a year without racial or religious discrimination. However, immigrants had to be "assimilated as far as possible into the spiritual and social unity of our people and must be morally and physically sound." The policy aimed to encourage the immigration of farmers, technicians, and skilled laborers.

**The People.** Ninety-seven percent of the population is estimated to be of European descent, chiefly Spanish and Italian; the remainder of Indian and mixed extraction. Argentina's population is predominantly urban with an estimated 75 percent concentrated in towns and cities of over 1,000 inhabitants. Highest regional density of population (in the eastern pampa) is about 26 persons per square mile; densities in all other regions are less than 8 per square mile. The three largest cities are: Buenos Aires, 2,600,000; Rosario, 517,000; and Córdoba, 274,000.

Spanish is the official language. The Roman Catholic Church is supported by the State, but other faiths enjoy complete freedom.

Argentina is rapidly developing its educational opportunities and facilities. It is estimated that at least 85 percent of persons over 18 years of age are literate, while recent official figures give 11 percent illiteracy for the country as a whole, with only 2 percent in the Federal Capital. Primary education is now free and obligatory. There are over 14,000 elementary schools with a total of more than 2,000,000 pupils; 250 high schools with a total enrollment of about 125,000; and 6 universities having a total student body of some 39,595. Argentina has more than 100 normal schools and a wide variety of institutions giving specialized instruction in agriculture, art, commerce, industry, etc.

**National Economy.** Argentina's economy is based equally on industry, agriculture, and cattle raising. Wheat and corn are the most important crops, but linseed, other grains and cereals, sugarcane, cotton, potatoes, and grapes are also significant. Before World War II some 60 percent of the wheat, 80 percent of the corn, and 90 percent of the linseed were exported. Argentina was the world's leading exporter of corn and linseed, and one of the chief exporters of wheat. The war caused a sharp decline in exports of these crops. Production figures for the leading crops in 1945 were: 4,085,300 metric tons of wheat; 2,965,500 tons of corn; 6,559,600 tons of sugarcane; 72,600 metric tons of cotton; and 157,300 metric tons of grapes.

Cattle raising is second in importance in the country's economy. Argentina normally produces three-fourths of the world's exports of chilled beef, and is the second largest exporter of mutton, and third of wool. Frozen and canned meat, hides, casein, and butter constitute the chief products of

the livestock industry. Total livestock in the country as of June 30, 1945 included: 34,010,300 cattle; 56,181,800 sheep; 8,009,700 hogs. In 1943, packing and slaughterhouses handled 6,698,000 beef cattle, 11,900,000 sheep, and 3,500,000 hogs. Production of dairy products in 1945 (11 months) included: 39,177 metric tons of butter and 72,403 metric tons of cheese. In 1945, 26,339 tons of casein were made.

Argentina is the leading manufacturing country of Latin America. The essential elements for extensive development of heavy industry, however, are lacking. Coal and iron deposits are limited and of low quality; waterpower sites are chiefly located in undeveloped areas. Processing of agricultural products is the leading industry, food, beverage, tobacco, and textile industries are important, while leather and chemical manufactures are increasing. Other manufactures include: cement, paper, electrical equipment, tires, glass, pharmaceuticals, and fabricated iron and steel products.

**Foreign Trade.** The total value of Argentine exports in 1945 was 2,485,220,000 pesos. Of this the United Kingdom received 25 percent; United States 22.4 percent; and Brazil 9.5 percent. Principal exports are agricultural and pastoral products. Wheat, corn and linseed lead the agricultural exports; meats, hides, wool, dairy products, by-products and residues constitute the chief animal products exported. Meat exports accounted for about one-fifth the value of total exports in 1945, and made up one-third of the total value of exports. During 1945 Argentina exported 118,945 metric tons of hides and skins. Leading groups of exports in 1945 listed according to value: livestock products, 1,286,053 pesos; agricultural products, 806,541,000 pesos; forest products, 69,544,000 pesos; minerals, 18,716,000 pesos.

Argentine imports in 1945 reached a total value of 1,154,002,000 pesos. Brazil supplied 28.9 percent; United States 13.7 percent; United Kingdom 10.1 percent. Textiles, foodstuffs, paper and wood and their manufactures, and chemical products comprised Argentina's chief imports. Other important groups of imports were: paper, cardboard, etc.; chemicals, drugs, oils, paints; fuels and lubricants; iron and manufactures.

JOSEPH. P. BLANK.

**ARMY AIR FORCES, U.S.** As the Army Air Forces undertook the transition from World War II operations to a peacetime structure in 1946, the United States' military air arm pushed plans for a program designed to give the nation at least the minimum requirements for national security. Accordingly, General Carl A. Spaatz, who had succeeded General of the Army Henry H. (Hap) Arnold on February 9, 1946, as Commanding General of the AAF, asked for sufficient funds to support a permanent peacetime air force of 400,000 men. Compared with the nation's capsule Aeronautical Division, father of the AAF, founded in 1907 with one officer and two enlisted men, the manpower that General Spaatz requested as a minimum need was of gigantic proportions. But at the end of the second World War new conceptions of air power evolved that would have to be met with sufficient manpower and ever changing scientific and mechanical resources.

Despite the unescapable fact that military aviation was face to face with new developments of great impact, such as supersonic speeds, jet propulsion, pilotless aircraft, guided missiles, rockets, the atomic bomb, and occupation, the AAF in 1946 had comparatively little money to meet these chal-

lenges. Whereas, for the fiscal year ending June, 1946, expenditures for the postwar AAF aggregated \$2,518,914,260, the Air Forces could look forward to but a half of that—\$1,200,000,000—for the year ending June 1947.

Coupled with the necessity of pursuing a program at home designed to maintain air supremacy for the United States was the AAF's assignment to the task of occupation in Europe and in Japan. A similar task had been undertaken by the United States Air Force in Europe (USAFE) with headquarters in Wiesbaden, Germany. By June 1946, USAFE had a working strength of 50,508 officers and men towards its goal of 70,000. While USAFE planned to have an aircraft strength of 2,700 airplanes, there were 1,946 AAF planes in Europe in August 1946. By that time USAFE was operating from 26 airfields. These included Tempelhof Air-drome in Berlin, Dornier Field near Munich, in addition to bases scattered strategically throughout Germany.

Equally important was the job of sustaining air vigilance over occupied Japan and areas in the Pacific. Right after V-E Day the task given the reorganized Fifth Air Force, was to police the air over the four Japanese home islands of Honshu, Hokkaido, Kyushu, and Shikoku, as well as the American-occupied area of Korea. By June 1946 there were 63,786 AAF officers and men in the Pacific Ocean areas, although a sizeable percentage of that number was awaiting discharge.

**Postwar AAF Reorganizes.** Mindful of destructive consequences should United States air supremacy be voided, the AAF's wartime commanding general, General Arnold, sounded a postwar warning to the nation:

"The future security of the United States lies in the air—there is no doubt of that. At the close of this war we had the greatest air power in the world, the arsenal of the world, and were the dominating country to whom all the small nations looked for leadership. If we lose our position, if we allow ourselves to be complacent, our country will be vulnerable to attack and devastation as never before in its history."

It was significant that General Arnold, in attacking "complacency" and unpreparedness, was talking to members of the Institute of the Aeronautical Sciences, since that group was highly cognizant of the changing conceptions of air power ushered in by the atomic and supersonic age. Since manpower was still a potent factor in the strategy of defense, despite the heavy inroads demobilization had made in AAF strength, streamlining of the Air Forces was undertaken in March 1946 to help meet the new challenge. The reorganization of the AAF into three major combat commands and five supporting commands resulted in the Air Defense Command, the Strategic Air Command and the Tactical Air Command as the three major commands, and the Air Transport Command, the Air Materiel Command, the Air Forces Proving Ground Command, the Training Command, and the Air University, as the five supporting commands.

The Air Defense Command was given the responsibility of domestic defense and coordinating the Air National Guard and Air Reserve organizations designed to provide trained personnel to augment the 400,000 regular AAF men requested by General Spaatz. Proposed were an Air Reserve to include 50,000 officers and 12,000 enlisted men, and an Air National Guard composed of 7,911 officers and 49,471 enlisted men. With return of the National Guard to state control following the general demobilization, the various States were

quick to approve the expanded Air National Guard proposed by the Army Air Forces. By the end of the year, the majority of States were in the process of organizing the 84 combat squadrons assigned to the Air National Guard. Air Reservists, who will man 306 additional combat and 278 service units, got back into action in July. By the year's close they were flying more than 10,000 training hours per week at 63 bases throughout the nation. Offensive action in event of another war and special bombing projects of an experimental nature were placed within the province of the Strategic Air Command, activated on March 21, 1946.

The Strategic Air Command was given direction of three air forces, two of which had been activated by the end of 1946. Since it also dealt with special bombing projects, the Strategic Air Command provided the personnel for the task group participating in "Operation Crossroads," the atomic bomb tests at Bikini on July 1, 1946.

The third major combat command established under the reorganization, the Tactical Air Command was to be the cooperating link between the AAF and ground and naval forces. The Tactical Air Command also was to train and equip mobile flying combat forces for independent operations anywhere in the world.

Of the supporting commands in the AAF reorganization, the Air Materiel Command was to set up the yardstick as it did during World War II, of aeronautical advances designed to give the United States air supremacy. In the vast laboratories at Wright Field, Ohio, the Air Materiel Command was to achieve during 1946 a series of notable accomplishments that would make aeronautical history. Among these were long range research into the aerodynamics of supersonic speeds, experiments in "push button" flight of pilotless aircraft, development of all-weather flying systems, studies of rockets, guided missiles and radio control mechanisms. The Air Materiel Command also assigned vast research on jet propulsion to the AAF base at Muroc Field, California. Research in liquid propellant rocket engines was conducted at the California Institute of Technology, while research in radar was divided between Aberdeen, Maryland, and Boca Raton and Orlando, Florida. The work of redesigning and re-engineering ground-to-plane radar and radio equipment was assigned to the Watson Laboratories in Red Bank, New Jersey.

The Air Transport Command, continued the important, though smaller role in 1946, maintained during World War II, when it performed the miracle of transporting 3,639,648 passengers, including sick and wounded, in addition to more than one million and a half tons of mail and cargo over some of the most hazardous air routes in the world. The Air Transport Command's responsibilities and operations in 1946 included military command of all American troops (ground, service, and air), communications and bases from Iceland to the South Atlantic, comprising more than 26,000,000 square miles of territory; as well as a number of new services, such as weather, communications, flying safety, flight control and air rescue, which were also placed at the disposal of all AAF divisions.

The wartime record of the Proving Ground Command made it one of the essential units in the postwar Air Forces. In October 1946, the AAF undertook a \$35,000,000 program at Muroc Dry Lake, California, to transform the 70-square-mile area into the world's largest airport for jet and rocket-propelled aircraft. Some of the Proving Ground Command's personnel were part of the group re-

sponsible for perfecting the "drone" unmanned aircraft used in "Operation Crossroads" at Bikini.

The Training Command continued its major role under the 1946 reorganization. Training of AAF personnel was controlled by two branches—the Flying Training Command at Randolph Field, Texas, which trained pilots, navigators, gunners and bombardiers, and the Technical Training Command at Scott Field, Illinois, which supervised AAF ground personnel. The Air University, an innovation, described as a post-graduate college of the Training Command, operating on the theory that improved doctrines in air power must be constantly revised to meet technological progress, furnished AAF officers with factual knowledge, skills and techniques essential to them as commanders and staff officers, and served to stimulate thought on military aircraft of the future. Five schools were operated by the Air University in 1946.

**New Concepts of Air Power.** A world shrinking in size under the impact of aviation advancements—long-range, high speed flight, jet-propelled aircraft, rockets, guided missiles and other factors—prompted the AAF to intensify its efforts in 1946 to maintain world leadership in aeronautical research and development. The famous "Operation Musk Ox" early in 1946, and the dramatic flight of the Superfortress *Pacusan Dreamboat* in October were AAF accomplishments that demonstrated the necessity of accepting the Arctic regions as an important factor in the maintenance of air power.

A hint of this new concept in its relation to American defense was given by General Spaatz in an address before the American Legion convention on September 30, 1946, when he said:

"At the end of World War II, air power is developing so rapidly that devastating attacks launched in one hemisphere against the other are a certainty in any future war.

"Through the Arctic, every industrialized country is within reach of our strategic air power. America is similarly exposed. We are, in fact, wide open at the top. War becomes global, making all flat projection maps obsolete, along with the thinking based upon them."

Earlier, in a statement on August 1, 1946, marking the 39th anniversary of the founding of the AAF, General Spaatz warned of the necessity for keeping up-to-the-minute on new air weapons, when he declared:

"We can never be completely certain about the future, but we know that improved atomic bombs, pilotless aircraft traveling at supersonic speeds, and guided missiles are or soon will become realities. They are weapons with which we can deal successfully and quickly with any enemy. In World War II, America's air potential came of age. It grew up in size, efficiency, striking power and in technological developments. That process of growth took time, but we must now realize that never again will we have time for such expansion."

It was plain that atomic energy would have tremendous influence on the future of air power. In 1946, air power was seen as the best method of striking an enemy with the weapon that had leveled Hiroshima and Nagasaki in the closing days of World War II.

**Jet and Rocket Propulsion.** American airmen almost smashed through the sonic barrier in 1946. The AAF actually announced an aircraft capable of exceeding the speed of sound and climbing 80,000 feet into the stratosphere. This development became more than speculation through extensive progress in new types of propulsion—jet and rocket. By the end of the year, the AAF already had

successfully tested its first rocket-propelled plane, the Bell XS-1, built to penetrate and go far beyond the sonic barrier. In the field of jet propulsion, also capable of pushing aircraft to speeds never before attained, the Army Air Forces led the world. Although the first jet engine was a British development (Air Commodore Frank Whittle of the RAF was awarded America's Daniel Guggenheim medal in 1946 for pioneering the development of turbo-jet propulsion of aircraft), the AAF forged ahead with improvements that were to give the United States top place in this revolutionary concept of speed. The AAF also had access to valuable jet and rocket propulsion equipment and studies made by the Germans during World War II.

Although the AAF made a definite shift in its overall research program from conventional engines to jet and rocket propulsion, it did not abandon work on piston-type engines. In fact, combinations of rocket propulsion and conventional type engines were developed in 1946, in addition to aircraft using either jet or rocket propulsion exclusively. The famous P-51 Mustang fighter was outfitted with a ram jet engine on each wing tip. Another fast AAF plane developed as a combination-powered aircraft was the new XP-81, which was a compromise between propellered planes and jets to include features of each.

The only reciprocating engine developed by the AAF during 1946 that gained wide attention for its unusual power features was the 5,000 horsepower XR-7755. Built by the Lycoming Division of the Aviation Corporation, Williamsport, Pennsylvania, this new aircraft engine, equal in power to a railway locomotive, was described by air experts as possibly providing the key to around the world non-stop flights. The AAF believed that the engine could increase the range of existing planes to more than 11,500 miles and would boost their present payload from 10,000 to 50,000 pounds. The liquid-cooled, 36-cylinder engine had a revolutionary feature whereby the pilot could control its power much as a motorist shifting gears in his automobile.

Air Forces engineers also studied the many applicable phases of jet propulsion, including combustion phenomena, ceramics, metallurgy, advanced engine geometry, and the study and development of new propellers.

Long distance transportation of jet-propelled fighter planes had its first test on May 19, 1946, when 20 P-80 Shooting Stars of the 412th Fighter Group made, in several stages, a mass flight from March Field, California, to Washington, D.C.

The Army's peacetime Air Forces will be built chiefly around jet-propelled fighters and bombers, ultra-long range aircraft of both types, and other revolutionary aviation designs, which, under the impetus of war, were pushed 20 years ahead of their time. More powerful and longer ranged bombers, such as the B-36 super bomber, will take the place of the famous war-tried B-29, and a fighter nucleus of jet planes will replace wartime fighter planes.

It was realized that one of the greatest forward steps in the AAF's research program was the advent of the turbo-jet engine, which took advantage of a new technique for disturbing the air and obtaining tremendous forward thrust. The AAF was well on the road to conquering the sonic barrier which heretofore had been a stone wall to the tremendous speed capabilities of its new aircraft.

"Operation Musk Ox" and *Pacusan Dreamboat*. The advantages of air transport in the Arctic regions were demonstrated conclusively in "Operation Musk Ox" which was undertaken early in 1946

by the U.S. Army and the Canadian Army. A study was made, under far northern conditions, of Army-Air cooperation, methods of air supply, the mobility of over-snow vehicles, the effect of the Magnetic Pole on navigational instruments and the problems affecting the Arctic operation of an air force unit. During the 81 days of travel through many areas never before explored, the entire "Musk Ox" force was entirely dependent on aircraft for supplies.

Winterization of all "Musk Ox" planes included many new techniques never before tested. Since temperatures ranged from 40 to 50 degrees below zero, external plumbing had to be specially wrapped. Plastic brackets, which crystallize at extremely low temperatures, were replaced with metal. Electrically controlled propellers replaced the usual hydraulic props which are difficult to feather in low temperatures. Gliders came into their own, since they proved their effective use for supply in areas that were snowbound and otherwise confined.

Meteorological data gathered on the expedition was seen to be of immeasurable assistance in aiding AAF weather engineers to make forecasts far in advance. The AAF decided on that basis to install more Arctic weather stations, both for civilian and military purposes. The functioning of electronic equipment in the areas affected by the Magnetic Pole was considered highly important because of the data required for future over-the-pole flights and operations in Arctic regions. The C-47 cargo planes were equipped with Loran (Long Range Navigation), one of the AAF's newest electronic devices for navigation, developed and used during World War II for long-range flights where regular radio communication was impractical. Radar beacons were used by the ground party to guide the supply planes the last few miles to drop areas. Other navigational aids carried by the planes for testing were electric gyros, radio altimeter, and the AAF instrument landing approach system.

Strengthening the polar-concept in AAF strategy was the dramatic flight of the *Pacusan Dreamboat*, a highly modified B-29 Superfortress, on October 5-6, 1946, from Hawaii to Cairo, Egypt, by way of the Arctic Circle. The plane, which made the 9,442-mile journey in 39 hours and 36 minutes, proved the practicability of a long range flight across polar routes by properly equipped aircraft. The flight provided the AAF with valuable information on navigational, engineering, communications, weather, fuel consumption and physical endurance problems. The *Pacusan Dreamboat* confirmed the evidence that the North Magnetic Pole is at least 200 miles farther north than the position shown on maps. Commanded by Colonel Clarence S. Irvine, the B-29 took off from Hawaii with the heaviest load ever carried aloft by aircraft. On board were 13,000 gallons of gasoline, more than half the total take-off weight of 147,000 pounds, which was 27,000 pounds over the maximum gross weight designed for a standard-built B-29.

The flight of the *Pacusan Dreamboat*, completed without mishap, brought the Distinguished Flying Cross to Colonel Irvine, to the pilot—Colonel Beverly H. Warren, and to the navigator—Major Norman P. Hayes. The other seven crew members were awarded the Air Medal. The flight showed that Chicago can be brought within non-stop B-29 range of Tokyo, Shanghai, Bombay, Istanbul or Cairo. The implication of the polar-concept of air strategy meant that in order for a plane to fly east or west, it will fly a northern route and end up flying south.

**AAF Research and Development.** "Military aviation

is taking a good look into the future. What it will see and bring into practical realization will furnish the key to the peace and the security of the United States."

With these words, Major General Curtis E. LeMay, deputy chief of Air Staff for Research and Development, indicated in 1946 that the AAF intended to throw all the resources it could muster into efforts to keep pace with aviation progress. By the end of 1946 the AAF's research and development laboratories at Wright Field could point to an impressive list of achievements ranging from jet engines, rocket research, plastic planes and "push-button" flight to new aerial cameras and rescue devices. The spectacular "Operation Crossroads" at Bikini pushed AAF research forward.

The AAF's role at Bikini was dramatic and of major importance when it dropped the world's fourth atomic bomb on target ships in the history-making mission. The AAF helped accomplish the primary purposes of the test as planned by joint Army-Navy Task Force One.

Three thousand AAF men went through five months of training, pointed towards the dropping of the bomb, named "Gilda," by the AAF B-29 plane, *Dave's Dream*, piloted by Major Woodrow P. Swarcutt. A number of AAF aircraft orbited at specific points to wait for the signals which would release blast gauge instruments and trip off automatic high speed cameras. Four AAF planes, B-17 Flying Fortresses, were pilotless and radio controlled, making it the first time in history that a four-engined bomber had ever been put in the air with no one aboard. These crewless planes ploughed their way through the deadly radioactive cloud within minutes after the bomb exploded. When the test was over, Secretary of the Navy James V. Forrestal declared, "The Army Air Forces was magnificent," while Assistant Secretary of War for Air W. Stuart Symington described the AAF's work as "a perfect mission."

Since the AAF placed great emphasis on the development of turbo-jet engines for high speed aircraft, the period following V-J day witnessed considerable progress in this field. A noted example was the General Electric TG-180, an axial, flow-type jet engine that was used to power the famous P-84 Thunderjet fighter plane, which made an unofficial world's speed record in September. Nevertheless, the propeller which the turbo-jet engine was designed to eliminate came in for its share of research as a potential auxiliary to supersonic flight. In fact, AAF engineers envisioned the supersonic propeller as being five or six feet in diameter, having six or eight blades with a spinner half the diameter of the blade to cut down on drag, and running at 7,000 to 8,000 revolutions per minute, triple that of anything in existence. The gas turbine engine developed by AAF would offer the necessary power potential to drive this propeller, in the opinion of engineers. In such new aircraft as the XP-81 fighter plane, the AAF used a General Electric gas turbine which not only rotated the propeller but supplied a certain amount of jet thrust. Such engines have a tremendous power potential and are considered to be the probable main power plants for huge airliners, cargo planes and bombers of the future.

The Air Materiel Command perfected a pilot ejector seat which would allow the pilot of a high speed plane to leave, in case the aircraft is disabled, without the danger of hitting the tail of the plane. The escape system is automatic from the time the pilot is ejected in his seat right up to the point when his parachute opens. The first successful jump

with the pilot ejector seat was made by First Sergeant Lawrence Lambert over Patterson Field, Dayton, Ohio, from a P-61 Black-Widow traveling at 300 miles per hour at an altitude of 8,000 feet.

The AAF experimented with various types of rockets and jet-propelled bombs made for offensive bombing, anti-aircraft defense and air-to-air fighting. In August 1946, the War Department announced tests of a rocket-powered 10-foot-long projectile named "Gapa" (Ground-to-Air Pilotless Aircraft), which was "expected to be capable of seeking out and destroying possible enemy weapons before they can reach their target." A hitherto secret, guided missile, "Gapa" was propelled by standard Aerojet rocket units and had a booster power unit in the tail, accelerating the projectile to high speed within a few seconds. In January 1946, the AAF had under way a number of robot bomb projects. "Felix" was the name given a bomb that could be attracted to its target by heat within a limited radius. "Roc" was another bomb of 1,000-pound weight equipped with television to scan a target and relay vital information back to the aircraft, thereby allowing for aiming correction by the bombardier.

A guided missile used against the Japanese in India and in Burma was "Azon," which was further studied in 1946. This was an ordinary 1,000-pound bomb with a special tail assembly which enabled the bombardier in the plane from which the bomb was dropped to steer to the right or to the left by radio control. "Razon," a later development of the same bomb, allowed the bombardier to control the bomb both in direction and range. In addition to the development of new missiles, AAF engineers of the Proving Ground Command conducted tests of captured German projectiles, notably the jet-propelled V-1 and the rocket-propelled V-2, for the purpose of making improvements.

During 1946, AAF engineers progressed towards development of an all-plastic plane. On September 3, successful tests were made of a glass fiber wing, constructed of a new basic material comprising 55 percent glass fiber and 45 percent resin. It withstood 105 percent of the required design load without buckling or wrinkling in the glass-like surface. Operational advantages would include greater aerodynamic efficiency, largely through the absence of rivets and joints found in the conventional metal wing. Furthermore, the greater rigidity of the wing structure would result in smoother flow of air over the wing surface. Some time earlier, the AAF had started development of a plastic fuselage.

The successful test of the much-publicized "push-button" flight, fully automatic from take-off to landing, was announced on February 3, 1946, by Air Materiel Command. A standard C-54 transport plane, equipped for automatic flight, flew successfully from Wilmington, Delaware to Indianapolis, Indiana, and back with 14 passengers, without manual control by pilot or crew members. Outside weather conditions had no effect on functioning of the "push-button" equipment. The plane was operated by a mechanical "brain," known as the automatic flight controller.

In the field of meteorology, an all-important phase of the Air Forces' research program, the AAF made major progress in 1946. The AAF Weather Service, part of the Air Transport Command, formed four Very Long Range Weather Reconnaissance Squadrons of B-29s to fly daily weather missions into some of the most turbulent areas over Atlantic and Pacific waters. The information uncovered proved of great value to military and civil-

ian airmen, especially in connection with attempts to find the origin and movements of storm centers. The AAF also undertook a project dealing with "operational flyability through thunderstorms" under direction of the Proving Ground Command. Its aim was to increase flying safety through thunderstorms, and for the tests the AAF used a P-61 equipped with special instruments and measuring devices perfected with the aid of the National Advisory Committee for Aeronautics.

In July 1946, an AAF B-29 Superfortress "flying laboratory" made a high altitude flight to South America to study cosmic ray effects on radio transmission, electronics, materiel, and human beings. The plane, carrying AAF technicians and National Geographic Society scientists, flew at 35,000 feet. The scientists measured the intensity and quality of the cosmic rays at various altitudes of the earth's atmosphere, while AAF technicians studied their effect on equipment that was to be used by the Air Forces in its guided missiles program.

During the year at least two important developments connected with aerial photography were announced. In October the AAF added the FP-80, a camera-equipped version of the famous Lockheed P-80 Shooting Star to the ranks of its high speed photographic planes. The AAF described the FP-80 as the fastest photo reconnaissance plane in the world. A month later, the AAF announced that the K-30, the world's largest aerial camera, built to take large scale photographs from stratospheric reconnaissance planes, had been tested successfully. The camera with f/10 lens and 100-inch focal length, would take 9 x 18 inch pictures with two and one-half times more photographic detail from altitudes as high as 10 miles than could be obtained from the largest standard camera heretofore used.

In August, the pneumatic balance resuscitator, popularly known as the "baby lung," which stemmed from the AAF's wartime research was made available to public health authorities by the AAF. Designed and built in the Aero-Medical Laboratory at Wright Field, the "baby lung" was intended for use in emergency treatment of infantile paralysis cases until an iron lung could be made available for the victim. The device was described as a plastic valve, about two square inches in size, which when coupled with an anesthetic type mask, an oxygen bottle and an oxygen regulator, would serve as a resuscitator. The valve was designed by the AAF for use during the war to keep wounded crew members alive until the plane could return to its base.

As 1946 ended, the AAF revealed a fact that was considered certain to have far-reaching effect on research and development in all phases of military aviation—the employment of German aviation scientists of World War II. The AAF already had been making use of captured German documents and equipment in making improvements on aircraft and air weapons. Among the former enemy scientists were those who had done considerable work on rockets, such as the deadly V-2, and gliders. To break down the language barrier problem in deciphering captured German documents dealing with aviation, the AAF compiled an aeronautical 75,000-word German-English dictionary.

**Heavy Bombers. Consolidated-Vultee B-36.** Dwarfing in size, and exceeding in performance, any bomber operationally flown during the war, the B-36 was designed for a normal range of 10,000 miles with 10,000 pounds of bombs. The giant plane, first flown in August 1946, can carry 36 tons of bombs at reduced range, more than three times the capacity of the B-29 for the same distance. It is powered

by six Pratt & Whitney 28-cylinder, pusher-type engines, which turn the largest propellers ever installed on an airplane, and develop a total of 18,000 horsepower. A feature of the 19-foot, Curtiss electric, hollow steel propellers is a built-in anti-icing device, the first applied to production propellers. The use of two superchargers on each engine, together with pressurized cabins, enable the B-36 to attain a ceiling of over 30,000 feet. Its speed exceeds 300 miles an hour. In size, the new AAF bomber measures 163 feet in length, 47 feet in height, and has a wing span of 230 feet. The normal load of the wing tanks is 21,116 gallons of gasoline and 1,200 gallons of oil. Total area of the fuselage skin is 5,635 square feet. The wing, with an area of 4,772 square feet, incorporates a laminar-flow airfoil, and is mounted slightly forward of the mid-point of the fuselage. Comprising 3,924 cubic feet, the forward and aft cabin space constitute the largest volume of pressurized space on any bomber yet built. Extending the entire length of the bomb-bay section, on the left side of the fuselage below the wing, is a pressurized magnesium communications tunnel 85 feet long and two feet in diameter. This tunnel connects the forward and aft cabins and is provided with a four-wheel scooter by which crew members travel from cabin to cabin. The B-36 carries a regular crew of 11 men, plus a commander and a relief crew of four. Regular crewmen consist of a pilot, co-pilot, navigator-bombardier, flight engineer, radio operator and gunners.

**XB-35 (Flying Wing).** Revolutionary in its departure from conventional bomber design, the experimental XB-35 has no recognizable fuselage. This new AAF bomber is little more than a giant wing. Its general contour resembles a wide "V," following the swept-back principle for less drag, and its entire operating mechanism is contained within the wing itself. In length, the ship measures a mere 48 feet, but its 172-foot wing span exceeds that of the B-29 Superfortress by more than 30 feet. Quarters for the crew are in the forward third of the wing. At this point the wing is thickest—almost seven feet high. From a rounded leading edge, the wing increases rapidly in taper until the thickest portion is reached. Level for a short distance, the taper gradually recedes to the trailing edge, much in the same manner as the design of large wings on conventional bombers. The pilot's position is in the center and top of the wing, very near the leading edge. He is protected by a protruding blister similar to the type installed in fighter aircraft. Four Pratt & Whitney, X Wasp R-4360 pusher-type engines provide forward thrust. The contra-rotating propellers include a reversible-pitch feature for braking purposes. Dual main wheels and a single nose wheel comprise the retractable tricycle landing-gear. The unique design of the Flying Wing made impossible the use of standard vertical stabilizers, or rudders. Instead, split rudders, similar in appearance to dive-bombing flaps, were installed on the trailing edges near the wing tips. In order to turn, the pilot opens the jaw-like flaps to an angle which causes sufficient drag to pull the plane to the desired position. Elevators are combined with ailerons and are called elevons. Both functions are performed by these elevons which are located on the wings' trailing edges, just in-board of the split rudders. The AAF XB-35 can accommodate a crew of 15, which includes six men to serve as a relief crew.

**Medium Bombers. XB-43.** This experimental model is the first jet-propelled AAF bomber. Its airframe design is essentially that of the earlier XB-42, modified only slightly to incorporate the jet installa-

tions. In size it compares with the more commonly known A-26 Invader, which was used so successfully during the war. Somewhat larger and heavier, the XB-43 has a wing span of 71 feet, 2 inches, and measures 51½ feet from nose to tail. The two TG-180 jet engines, installed in the fuselage, supply the plane with more than 8,000 pounds of thrust power. Built by the Douglas Aircraft Company, the AAF bomber has a very rapid rate of climb and a speed of approximately 500 miles an hour. A pressurized cabin supplies pilot comfort at its service ceiling of 38,000 feet. Its normal range is approximately 1,400 miles.

**Fighter Planes. Republic XP-84 (Thunderjet).** This jet plane established an unofficial world's speed record of 617.8 miles per hour in September. The XP-84 is powered with a General Electric TG-180, an axial, flow-type jet engine, and has a range of 1,000 miles and a service ceiling in excess of 40,000 feet. By the unique location of its air scoop, the fuselage becomes one giant tube through which air passes into the axial flow engine, located behind and below the cockpit. The jet nozzle sweeping back and out of the tail of the plane makes for a direct straight flow of the expelled air. The Thunderjet is equipped not only with a fully pressurized cockpit for extreme altitudes, but with automatic air conditioning for the pilot at all altitudes of operation. Other features include a pilot ejection seat and a full-vision bubble canopy. External dimensions are: wing span, 36 feet, 5 inches; overall length, 37 feet, 3 inches. The XP-84 achieves new standards of aerodynamic cleanliness, as its exterior surfaces are completely free from protruding equipment of any kind.

Other jet-propelled aircraft developed and announced by the AAF in 1946 included the XP-81, XP-82, XP-83 and the XP-79.

**Rocket Aircraft. XS-1.** Blasting into headlines in December 1946, the first American rocket-propelled airplane initiated a new era in powered flight. Although held to a moderate speed of 550 miles an hour in its December test, future models of the XS-1 are believed to be capable of attaining a rate of 1,700 miles an hour. Designed in joint enterprise by the Army Air Forces, Bell Aircraft Corp., the National Advisory Committee for Aeronautics and Reaction Motors, Inc., the rocket aircraft is expected to attain an altitude of 80,000 feet. Not a combat model, it is fitted out as a flying laboratory to record the effects of transonic and super-sonic speeds on aircraft. Four rocket units, burning alcohol and liquid oxygen, supply a total thrust of 6,000 pounds for 4 units. The plane's length is 31 feet, and it is 10 feet, 10 inches in height. Although highly streamlined, the XS-1 employs rather conventional lines and has avoided the use of the swept-back wing. The plane's wing is very thin, with a maximum thickness of only ten percent of the chord. Other wing designs will be tried, incorporating the knowledge gained by experience with the test model.

**Photo Reconnaissance. FP-80.** Retaining all the flight characteristics of its predecessor, the Lockheed P-80 Shooting Star, the camera-equipped FP-80 was the fastest photographic plane in the air during 1946. Externally, it differs from the P-80 only in its shorter and slightly blunter nose. A variety of camera arrangements makes nearly every type of aerial photography possible. Three aerial cameras, one vertical, and two aimed at 60-degree angles to either side, allow for horizon-to-horizon shots several miles in extent at normal photographic altitudes. Other combinations of cameras may be utilized to provide shots ranging from wide-angle

terrain photographs to highly-detailed, pin-point pictures. Officially credited with a top speed in excess of 550 miles an hour, the new AAF plane has a range comparable to that of the P-80, and a ceiling well over 30,000 feet.

**Transport Planes. Douglas C-74 (Globemaster).** This AAF plane is the world's largest cargo aircraft. When flown it carried a gross payload of 40,000 pounds, the greatest known payload yet to be carried by any aircraft. The C-74 has a gross weight of 145,000 pounds and is powered by four Pratt and Whitney Wasp Major R-4360 radial engines. Each of these engines is capable of producing 3,000 horsepower. All nacelles are interchangeable and a complete power plant can be changed in less than one hour. The plane is equipped with Curtiss Electric propellers which will full feather as well as go into reversible pitch. The propellers also have automatic synchronization. The C-74 has a tricycle landing gear with dual wheels which are, including the tires, approximately 65 inches high. The propeller blades are 16 feet, 8 inches in diameter. With a flying range of over 7,000 miles and a service ceiling of 28,000 feet, the C-74 receives its fuel from tanks which have a maximum capacity of 11,000 gallons. A crew of five is required to operate the big plane, while additional accommodations are available for relief crews necessary on long flights. The main cargo storage section is 75 feet long, 62 feet of which is a constant cross section of 12 feet, 6 inches. Wing span is 173 feet, 3 inches and the overall length is 124 feet, 2 inches. The tail towers 43 feet, 8 inches from the ground. The plane can be used as a transport with enough room to accommodate 125 troops or 115 litters.

**Records, 1946.** In June 1946, General Spaatz, speaking of the world records established by the AAF after V-J Day, stated that at the beginning of World War II most of the performance records were held by other nations, including Germany and Italy, using their first line combat aircraft. With the exception of a few records held in large part by civilian pilots, the United States occupied the also-ran position, General Spaatz declared. But as the result of AAF funds spent during the war years for research, development and production of aircraft, the picture had changed and the Army Air Forces by the end of 1946 had already established at least 23 international and six national aviation records. Some of the 1946 records follow:

January 26. P-80 Shooting Star, Colonel William H. Councill, pilot, flew from Burbank, California, to Mitchel Field, New York, at 583 miles per hour, breaking record of Howard Hughes, 327.15 miles an hour, January 19, 1937.

April 19. P-80 Shooting Star, Captain Robert A. Baird III, pilot, made speed of 494 miles an hour over 100-kilometer course without payload, breaking previous record of 394.14 miles an hour held by Major General Ernst Udet of Germany in a Heinkel 112, June 5, 1938.

May 13. A B-29 Superfortress, Colonel E. D. Reynolds, pilot, reached altitude of 47,910 feet with payload of 1,000 kilograms, breaking previous record of 40,187 feet by Furio Niclet, Italy, December 9, 1937.

May 14. A B-29 Superfortress, Lieutenant J. P. Tobison, pilot, reached altitude of 45,252 feet with payload of 5,000 kilograms, breaking previous record of 34,025 feet by then Captain Clarence S. Irvine and Captain P. H. Robey, in a B-17 Flying Fortress, August 1, 1939.

May 17. A B-29 Superfortress, Lieutenant Edward M. Brabowski, pilot, flew 369 miles an hour over a 1,000-kilometer course with payload of 5,000

kilograms, breaking previous record of then Captain Clarence S. Irvine and Captain P. H. Robey, in a B-17 Flying Fortress, August 1, 1939.

May 19. Sikorsky R-5 helicopter, Second Lieutenant William L. Vavricka, pilot, and Second Lieutenant Kenneth R. Bloom, co-pilot, flew for duration record of 9 hours, 33 minutes and 27 seconds, breaking previous record of 1 hour, 32 minutes established by Igor Sikorsky, May 6, 1941, flying a Vought-Sikorsky helicopter.

May 22. An R-5 helicopter, Major F. T. Caschman and Major W. E. Zins, pilots, flew 705.3 miles, Wright Field, Ohio to Boston, straight-line course, breaking previous record of 143.06 miles made by Karl Bode, Germany, June 26, 1938.

June 3. An R-5 helicopter, Lieutenant Colonel K. S. Wilson, pilot, made 110 miles an hour over a 20-kilometer course, breaking previous record of 76.15 miles an hour made by Edward Rholfs, Germany, June 26, 1937.

**Unification.** The question of unification of the armed services and, specifically, the necessity for an autonomous AAF had been widely discussed in 1946. These points were scheduled for a prominent place on the Congressional agenda in 1947. The President had stated his position by pointing out the need for three coordinate services—the Army, Navy, and Air Forces, all on a parity basis and operating under the control and supervision of a Secretary of National Defense.

General Spaatz declared late in 1946 that the AAF needs autonomy, if it is to be an operationally ready, strategically deployed, and modernly equipped Air Force. He added that application of strategic bombing during World War II was an air power mission which surface forces could not accomplish. Secretary of War for Air W. Stuart Symington emphasized that unification of the armed services would provide the nation with maximum security at minimum cost and called attention to a Senate report on Pearl Harbor which he said showed that much of the responsibility for the setback then resulted from lack of Army-Navy coordination. He quoted from the United States Strategic Bombing Survey, created by Presidential directive, which stated, in part: "The lessons of the Japanese war strongly support that form of organization which provides unity of command capable of clear and effective decision at the top. Within a department of common defense which provides unity of command, and is itself orientated in the air and new weapons, the Survey believes that, in addition to the Army and Navy, there should be an equal and coordinate position for a third establishment."

Pointing to the need for co-equal status for air, land and sea forces, General George C. Kenney, commanding general of the Strategic Air Command, stated that "unification does not mean subjugation," and added that there would be "no submergence of our military forces" under the plan for unification which "the President has laid before Congress and before the people."

Airmen of the United States are not alone in these recommendations for autonomous air power. Viscount Trenchard, Marshal of the Royal Air Force, in a booklet entitled *Air Power and National Security*, parallels the recommendations of Mr. Symington:

"In the interests of economy and efficiency let the three Services be each in its own element and let them have true cooperation . . . not try to make each Service entirely self-contained within itself . . . with consequent wasteful competition and expenditure.

"Finally, I would emphasize the necessity of a

carefully considered allocation of the available money and material between the Services and based on a realistic outlook of our needs in war, but particularly in those vital opening stages of a war. In particular, I would emphasize that our main dangers in the future lie in the Air, and if we do not devote the major part of our resources to developing our own strength in the Air, we cannot hope to survive another world conflagration."

See DOOLITTLE RAID.

GEORGE E. STRATEMEYER.

**ART.** Against a background of national prosperity art flourished in 1946 as it had not since the pre-depression era. The art boom which began in 1943 was in full swing, and only a minor drop at the end of the year hinted that it might not continue forever. In the auction houses gavels rang down on sales which broke even the previous year's record high prices. In New York City, art capital of the nation, many new galleries appeared and established firms opened western branches.

If the art world reflected the financial good fortune of the country it did not mirror the spirit—the most striking feature of the first postwar year in art was an unmistakable turn to the esthetic left.

**Trends.** Despite the absence of any clearly defined aims in 1946 art activity was preponderantly left of center. This swing was evident in almost all of the larger national exhibitions including the Virginia Biennial, both Whitney annuals, the Carnegie "Painting in the United States," and the Pennsylvania Academy annual. There was an increased attention to fundamental problems of expression with the accent more on form and less on subject matter.

The past year, one of experimentation, saw increasingly more converts to modern movements—among the young artists as well as the older—many of whom "went modern" with belated interest. Those who did not turn directly toward the idiom of abstraction pursued a romantic, often fanciful ideal, which had supplanted defunct social realism.

Typical of the modern wave were most of the prize winners in national exhibitions. A five-man jury of artists awarded top prizes to Phillip Guston and John W. Taylor in the Virginia Biennial in Richmond. Other purchase prizes went to young "school of Boston" expressionist, David Aronson, and to Paul Arlt, Stephen Greene, Margaret Jensen, and Marion Junkin.

The most controversial award of the season was the first-prize winner in Pepsi-Cola's third annual, when \$2,500 was won by Boris Deutsch of California for *What Atomic War Will Do To You*, a sincere warning which recalled Picasso's famed *Guernica* and which received every epithet from "truly great" to "distorted mockery." Excluding the backward-looking *Carnival in Madrid*, painted in old Flemish style by Lucio Lopez-Rey, which won second prize, other top winners in the exhibition were modern. These were by Robert Cwathmey, Abraham Rattner and Gregorio Prestopino. Other outstanding winners were Xavier Gonzalez, John Heliker, Virginia Cuthbert, Margaret Tompkins and Everett Spruce.

The 1946 Carnegie Annual of Painting in the United States (Pittsburgh's internationals are not to be resumed until 1948) also was characterized by progressive painting. A jury of three artists awarded the four major prizes to moderns. The first prize was awarded to Karl Knaths for his semi-abstract, *Gear*; the second to Jack Levine, for his bitter *Welcome Home*; the third to William Crop-

per, for a satiric *Don Quixote*; and the fourth to Bradley Walker Tomlin, for a poetic abstraction, *The Armor Must Change*.

The Pennsylvania Academy's 145th Annual opened in Philadelphia to display a gathering less conservative than usual. Headed by Morris Kantor the all-artist jury (which had invited the majority of exhibits and picked only 50 paintings from 2,000 submitted) awarded prizes to such moderns as Prestopino and Benjamin Kopman.

In Chicago's Fiftieth Annual Exhibition the \$1,000 Walter Camp Prize went to Margo Hoff for *Murder Mystery*, a painting later selected for the Grand Central Galleries' winter "Critics' Choice" show—an exhibition of modern context.

The State Department also entered the modern art arena when, in response to specific requests from foreign governments for exhibitions of progressive United States art, LeRoy Davidson, head of the Department's active art program, picked two showings of contemporary art, one destined for the eastern hemisphere, with Paris the first stop, and the Latin-American republics second. Both exhibitions were first shown at the Metropolitan Museum. Generally approved by the art press which felt that Davidson had done the best he could with the meager funds at his disposal, the paintings drew fire from the conservatives.

Indicative of the 1946 international mood was the choice of Ralston Crawford, well-known abstractionist, as sole artist-correspondent to witness the Bikini tests. His painted report, when exhibited in New York, was good as abstract painting but told little about atomic explosion.

**Art Travels Overseas.** With wartime travel restrictions removed the year saw a startling amount of art travel overseas. First of the millions of dollars worth of art to cross the Atlantic was the journey to Washington of 200 German-owned masterpieces, valued at \$80,000,000, (late in 1945) which ignited the biggest art controversy, running into 1946. The paintings had been discovered in a salt mine in the American zone of Berlin where they had been removed by the Germans from the Kaiser-Friedrich Museum, now in the Russian zone. Their arrival was greeted with approval, confidence in American motives and requests for public exhibition (for European benefit) by one faction, while an opposing school of thought, registered dismay at the "confiscation" and urged immediate return of the paintings.

The next large shipment of art, the first of a series of good-will exchanges, was an American loan of 230 oils and watercolors covering American art from Colonial times to the present, which had been invited for summer exhibition in London's Tate Gallery. Picked by some of the ablest museum directors in the country the handsome show received a mixed English reaction: enthusiasm for early British-inspired landscape art and lukewarm-to-antagonistic appraisal of all later paintings whose vigorous roots were not to be found close to the British island home.

When these paintings returned in September they were accompanied by a magnificent return gesture. Great Britain had passed an act of Parliament and enlisted the generous aid of her King, her top museums, and private collectors to send the United States 62 paintings only recently come out of wartime hiding, by her great trio Hogarth, Constable and Turner. And, at the end of the year, a grateful Holland sent America "a garland of thanks" in the form of 48 sixteenth and seventeenth century Dutch masterpieces, loaned as a token representation of Dutch art which had been

looted by the Nazis and recovered by the United States Army. Following December exhibition at the National Gallery, the paintings began a tour of those museums with which the men of the Army's art section are now associated as civilians.

Other transoceanic exhibitions included a group circulated by the State Department, including "Sixty Americans since 1800," a selection from the large collection of International Business Machines. After New York exhibition the collection was sent on a long tour, starting in Cairo and then on to Italy, where it was to be joined by other business collections to tour Europe under the heading, "American Industry Sponsors Art."

**Museums Look Back.** In a year of uncertainty and stock-taking many museums and galleries turned back to thoughtful reevaluation of earlier artists. Outstanding was the Whitney Museum's excellent fall presentation of America's earliest ranking painter, Robert Feke. Comprising 30 sensitive, highly skilled portraits by this self-taught Colonial the exhibition offered much nourishment for national pride. Another Whitney exhibition was that of William Rimmer, a Colonial sculptor and physician, whose growing reputation contrasts with present-day scorn for his sentimental contemporaries in sculpture. The George Walter Vincent Smith Art Museum celebrated its 50th anniversary by a presentation of 47 works by George Inness. The Brooklyn Museum honored a pioneer American Impressionist, Theodore Robinson, 50 years after his death. An over-all view of the Victorian art era in America was presented by the Metropolitan Museum.

**In the Galleries.** During a year marked by few spectacular debuts that of a young sculptor, Charles Salerno, attracted deserved attention when fourteen works from his first exhibition, all attesting to mature understanding of form, material and modern idiom, were sold to astute collectors. Romare Bearden, who caused something of a sensation among modern enthusiasts by his debut the previous year, revealed again in his second exhibition of abstract paintings sound exploration along a path crowded by unskilled artists who had read the signs to the left. Edward John Stevens, 23-year-old New Jersey painter of strange worlds, followed up an earlier, phenomenal success with a new group of intricately-patterned, compelling watercolors. Hyman Bloom, catapulted to national attention through the Museum of Modern Art's presentation, "Americans—1942," held his first one-man exhibition in 1946. Andrew Wyeth, youngest and most gifted member of the Wyeth family of artists, displayed again his rare technical virtuosity, fortunately matched by discrimination and sensitivity.

Painting by refugee artists, many of whom had become United States citizens, provided some of the most exciting exhibitions of the season. A retrospective showing of paintings and drawings by George Grosz was a memorable event, illustrating the great gifts and stylistic evolution of a significant contemporary painter. The figure of Karl Zerbe also loomed large on the national scene—both as an outstanding painter and an extraordinarily talented teacher. Zerbe's 1946 exhibition, the first in some years, was also his best to date, while the influence of his classes at the Boston Museum School was seen in the growing vitality of a group of young painters, headed by David Aronson, who were making Boston a progressive art center.

Among established artists who achieved successful changes of style in 1946 Charles Burchfield was outstanding. Deserting his romantic realism of the

past thirty years, Burchfield exhibited a group of enormous nature fantasies that were strong and enchanting reworkings of 1917-18 watercolors of the four seasons. Prominent among the abstractionists was Bradley Walker Tomlin, who proved again, that in the hands of a sensitive artist, a primarily intellectual style could achieve both warmth and beauty of sensuous appeal. Irene Rice Pereira remained unchallenged in the realm of pure abstraction, while Stuart Davis continued to stand high among practitioners of dynamic, flat-patterned modernism.

In the growing school of romantic painters William Thon's exhibition of richly-painted, moody impressions of land and sea assigned him a leading position. Other distinguished works by artists in this group were shown by Jon Corbino (who continued to experiment with line and form); Henry Mattson, Jean Liberte, Hobson Pittman, Dan Lutz, and Ferdinand Warren.

From Reginald Marsh came further evidence of his power as a robust painter of the people's pageant. The first large eastern exhibition of mystic painting by Kenneth Callahan, curator of the Seattle Art Museum, was a rewarding presentation of an original artist.

Among the sculptors neither William Zorach nor Jose de Creeft presented new works of such impact as the former's beautiful *Victory* or the latter's magnificent *Head of Rachmaninoff*, but both maintained their positions as sculptors of the first magnitude. Hugo Robus, another sculptor of distinct stature, and Oronzio Maldarelli, were effectively presented in 1946, while Texan Charles Umlauf made an auspicious New York debut. Jane Wasey, Mitzi Solomon, Lu Duble and Doris Caesar were other notable exhibitors.

**Foreign Art.** For the first time in generations British art caused excitement in foreign art circles and it was from there, rather than France that most of the outstanding European art appeared (to Americans) to be coming in 1946. Climaxing the numerous American introductions to vigorous Britons, such as Graham Sutherland, John Tunnard and John Piper, was the Museum of Modern Art's presentation of sculpture and drawings by England's powerful sculptor, Henry Moore. Opened late in December, the exhibition was the most comprehensive accorded this compelling artist, in or out of his native land.

Contrasting, however, with the increasing influence of the modern movement in England was the reported public reaction to the controversial exhibition of works by Picasso and Matisse, held in England at the Victoria and Albert Museum. Other contemporary French art was shown in England at the Tate Gallery, which reopened seven of its forty damaged rooms with exhibitions of Bracque and Rouault. The Tate also announced a government grant for acquisition of contemporary art. The Royal Academy presented a comprehensive view of Greek art through 5,000 years. The National Gallery reopened to display masterpieces returned from wartime hiding in Wales.

France seemed well established along the road to recovery in art activity. Picasso exhibited what was reported to be "yet the most flabbergasting of his postwar shows," at the Galerie Carré. Most promising gallery in Paris appeared to be the Galerie de France, hospitable exhibition center for new talent. Featured exhibitions there were by Fougereon and Pignon, best known among the new group of French artists, and by Robin, Tailleur, and Talcoat.

Royally received among the artists who returned

to France from the United States was Marcel Vertès, whose entire exhibition of 50 works was sold during the first day of his Paris exhibition. Paintings by Enrico Donati and Ardit Blatas were also popular.

Other modern exhibitions in France included "Magie de la Realite," with works by Leprieu, Tanguy, Berman, Humblot and others. The Palais des Beaux Arts offered a large, non-objective "Salon des realites nouvelles." Admirers of Delacroix found time to restore his Paris studio as a museum. Biggest popular hit of the summer season was a handsome presentation of "French Tapestry from the Middle Ages to the Present," which included recent tapestry designs by Lurcat, Saint-Saëns, Dufy.

Art journalism was enriched by the return of *Verve* (France) to its prewar lushness, and the appearance of several new publications, outstanding among which were a new French quarterly, *Art et Style*; *The Arts*, edited in London by Desmond Shawe-Taylor; and a promising *IL '45*, so called for the year of its native Italy's liberation.

**Business and Art.** Some happy strides were made in the fast growing sponsorship of art by industry for mutual advantage. The Pepsi-Cola Company hired Roland J. McKinney, former director of the Los Angeles Museum, to supervise its art program. Among other changes McKinney widened the scope of the company's national art competition, exchanged the dual jury system for seven regional juries, and discarded the bizarre installation which took a deserved castigation in the press last year.

La Tausca Pearls, which had sponsored a "Woman with Pearls" competition earlier in the year, also liberalized plans for its second competition (scheduled for 1947) and picked a jury of artists and museum directors to invite 100 paintings for the show with the arrangement that exhibitors be paid for the loan of their paintings, and be eligible for prize awards totaling \$6,400.

**Museum Acquisitions.** It was an active year for museum expansion and acquisition. Des Moines saw the beginning of construction for a new art center designed by Eliel Saarinen. Richest acquisition of the year was a Kress gift, 110 Old Masters, which enriched the National Gallery for the third time, yielding fuller coverage of the Italian School and important additions to French, English, and German schools of painting and sculpture. The National Gallery also acquired its first painting by Ryder, the important *Siegfried and the Rhine Maidens*, purchased through the Mellon Fund.

The Boston Museum purchased an excellently preserved *Crucifixion* by Duccio, the Sienese master's seventh painting to reach America. The William Rockhill Nelson Gallery acquired a rare, late Velasquez portrait, *Mariana, Queen of Spain*. To the Minneapolis Art Institute went a *Prodigal Son* by David Teniers the Younger. The Springfield Museum purchased a fine Chardin still life and the Toledo Museum bought *Peasants Before an Inn* by Jan Steen. Chicago acquired Renoir's *Seated Nude*.

**Theme Shows.** Big theme shows indicated vigorous national activity and covered everything from the role of ancient animals and eternal nudes in art (in two splendid reviews at the Boston Museum and the Wadsworth Atheneum, respectively) to recent importations from Paris.

Primitive art was effectively presented by "Arts of the South Seas" at the Museum of Modern Art, which also honored its first woman in an exhibition by Georgia O'Keeffe. Most impressive of the Old Master exhibitions was staged by the Los Angeles

Museum which borrowed 43 paintings by Rubens and Van Dyck for an exhibition arranged by the museum's new director-consultant, William R. Valentiner. French art received a glorious tribute in an all-star showing, "The Spirit of Modern France," cooperatively arranged by the Toledo Museum and the Art Gallery of Toronto, with loans from 30 public and private collections in Europe and America. British art was represented at the Boston Museum which held an important loan exhibition of landscapes by Turner, Constable, and Bonington.

Three shows which provided interesting examination of group taste were provided. The Akron Art Institute invited fifteen prominent figures in the art world to suggest 40 American paintings typifying the best in United States art, from Colonial days to the present. Of the 167 artists nominated the only unanimous choice was Albert P. Ryder. Homer, Eakins, and Inness received 14 votes each; Bellows, 13; Copley and Stuart, 12. Five contemporaries were named nine times: Hopper, Burchfield, Hartley, Marin, and Weber.

Later seventeen leading institutions loaned three "best American paintings since 1929" to the Rhode Island School of Design for its "Museum's Choice" exhibition. Leading "choices" were Hartley (first), Kuniyoshi, Watkins, Brook, Mattson, Burchfield, and Hopper.

In New York the Museum of Modern Art presented "Fourteen Moderns," a disappointing exhibition which introduced no new vital talent and yielded no broad picture of contemporary art.

An excursion into the past—the Whitney Museum's "Pioneers of Modern Art" (American)—assured observers that early moderns still looked valid in 1946, when they seemed more contemporary than the paintings belonging to the regional schools of the 1920s and 1930s.

Outstanding among the one-man shows were the large exhibition of Corot, presented at the Philadelphia Museum, and the comprehensive exhibition given Bellows at the Chicago Art Institute, 20 years after his death.

**Sculpture.** Sculptors spoke up at long last in two impressive December exhibitions: at the American British Art Center (New York) where 47 sculptors offered 47 easily transportable works in a "Suggestion to the State Department," which has neglected sculpture in its activities; and at the Architectural League (New York) where the Sculptors' Guild effectively proved that "Architecture Needs Sculpture."

An important museum show in the medium was the Detroit Institute of Art's searching exhibition, "Origins of Modern Sculpture." Sculpture was notably represented in the Whitney annual, which also leaned strongly left. In Minnesota the Sculpture Group collaborated with the Walker Art Center to present the largest regional sculpture annual.

**Auction News.** A startling total of \$6,685,045 worth of sales broke all past records for Parke-Bernet's 1945-46 season, topping last year's figure by half a million. Highest price, \$75,000, was paid by impresario-collector Billy Rose for Rembrandt's *Pilgrim at Prayer*. A Hals *Portrait of Joseph Cowmans* brought \$34,250; a Velasquez *Portrait of Girl*, \$30,000. Growing demand for modern art was reflected in the \$30,000 bid paid by a private collector for *La Buceuse* by Toulouse Lautrec and in \$4,000, for a Bracque *Vase d'Anemones*. Typical of revived fashion for meticulous 19th century genre was a bid of \$5,200 for Fortunate's *Breakfast at the Alhambra*. Other major auction galleries, Kende of Gimbel Brothers, Plaza Art Galleries

(both in New York) and Freeman Galleries (Philadelphia) saw similar prosperity.

**Art Books.** Despite continued printing difficulties publishers offered the most colorful lists since the war, but emphasis was largely on picture books. Distinguished among the more ambitious undertakings were: Arthur Upham Pope's *Masterpieces of Persian Art*; Max Raphael's *Prehistoric Cave Paintings*; Otto Benesch's *Art of the Renaissance in Northern Europe*; L. Bachhofer's *A Short History of Chinese Art*; C. Sachs' *Commonwealth of Art*; Arthur Stanley Riggs' *Titian the Magnificent*; R. Langton Douglas' *Piero di Cosimo* and a one volume edition of *Vasari's Lives*, edited by Betty Burroughs.

**Art and Ballet.** All four active ballet companies commissioned major artists for new decors, with notable stage art created by Chagall, Berman, Oliver Smith, and Cecil Beaton. Isamu Noguchi scored again with his sculptured objects for Martha Graham's dance concerts.

JUDITH KAYE REED.

**ASIA.** Including the Asiatic part of the U.S.S.R., the continent of Asia has an area of about 16,752,600 square miles and a population estimated at 1,200,000,000. See the separate articles on ARABIA, CHINA, INDIA, JAPAN, and the other Asiatic states and territories.

**ASSEMBLIES OF GOD, General Council of the.** A religious organization incorporated in Arkansas in 1914 by a group of independent pastors interested in a distinctively evangelistic type of mission work. Headquarters, 336 West Pacific Street, Springfield, Missouri.

**ASTRONOMY.** Notable progress in many directions has been made in astronomy during the year. Most scientists, now released from wartime duties, have resumed research in observatories, laboratories, and in theoretical studies. Challenges to orthodox concepts are frequently heard.

Two astronomers of the National Astrophysical Observatory at Tonanzintla, Mexico, Dr. C. Graef and Sr. L. E. Erro, suggest on the basis of recent calculations that the rate of expansion of the universe is not diminishing, and that the extent of space must be determined from old Newtonian concepts rather than from the newer relativity theory of Einstein. The Mexican scientists support the view that the red shift in the spectra of outer galaxies is due not only to their actual recession but also to cosmic effects which influence the photons of light traversing the great distances to the observer.

Dr. A. E. Whitford, of Washburn Observatory, using a photoelectric cell and other electronic apparatus attached to the 100" reflector at Mt. Wilson, has established a new technique in obtaining star diameters. The variation of the light of a star, as it is being occulted by the edge of the moon, gives a special pattern in diffraction images which is compared with the theoretical pattern for a point source of light. Results agree closely with other methods of computing stellar diameters.

Dr. H. S. Hogg, of David Dunlap Observatory, made further contributions concerning variable stars in globular clusters, noting that the average period of variables in some clusters is half a day and the frequency distribution of periods has only one maximum. In other clusters, two distinct maxima may be found, one of period one-third day and the other of period two-thirds day. No reason has as yet been indicated for these two types of

variable star distribution. From other studies of these variables, it is suggested that the center of our Milky Way galaxy may be not more than 26,000 light-years away rather than the previously accepted 33,000.

The center of our Milky Way system has also been the subject of photographic study in infrared light for the purpose of locating the galactic bulge found in many other such stellar systems. The general position and form of this bright nucleus, or central clustering of stars, was established as running near and parallel to the galactic equator, and centered at longitude  $326\frac{1}{2}^\circ$  in the constellation Sagittarius.

During the year two more novae were added to the list of repeaters, which now totals six according to Harvard astronomer M. W. Mayall. T. Coronae Borealis, which last underwent an outburst in 1866, again flared up on February 9, from 10th magnitude to 3.2. Unlike normal novae, its spectrum indicated no main shell of ejected gas, but simply a continuous ejection at decreasing speed, according to Dean B. McLaughlin of the University of Michigan Observatory. After a precipitous decline, the nova climbed to a secondary maximum of about 8th magnitude in June, the entire light-curve being remarkably similar to the 1866 performance. Nova Sagittae 1913 also had another outburst on June 28, increasing from a normal of somewhat less than 11.8 to about 8th magnitude.

Comet Brooks of 1889, having a period of seven years, was again seen on June 29 by Dr. H. M. Jeffers at Lick Observatory. Its magnitude was about 18. When this comet was first seen in 1889, Barnard noticed it was attended by four faint companions, the probable wreckage of a close encounter (55,000 miles) with Jupiter, calculated to have occurred in 1886.

Dr. G. VanBiesbroeck of Yerkes Observatory, working with the 82" McDonald reflector, observed Comet Oterra near its aphelion, or orbital position most distant from the sun. This comet and Comet Schwassmann-Wachmann share the distinction of being the only comets visible from the earth throughout their entire orbital paths around the sun.

From wartime research came the development of the icaroscope, a new optical device for observing objects in the sky near, and in front of, the sun. The solar image and surrounding sky are projected on a phosphor-treated screen. The special phosphors have strong afterglow properties which are, however, not much greater for exposure to the sun than for the surrounding sky, thereby reducing the contrast and permitting simultaneous observation of the sun's disc and nearby objects.

A widespread, brilliant aurora was seen on the night of July 26-27 by many observers in the United States, following the appearance of a large sunspot group seen from the U.S. Naval Observatory on July 9. The Bureau of Standards has established a new service warning of radio blackouts to be expected from solar magnetic storms and ionospheric changes following solar eruptions. Radio specialists of the Carnegie Institution have developed a pulse-ranging technique (similar to radar) to detect ionosphere effects produced by clouds of charged particles released from sunspots.

On January 10, scientists of the U.S. Signal Corps at Camp Evans, under the direction of Lt. Col. J. H. Dewitt, succeeded in getting radar echoes from the moon, the pulses being reflected back in a period of 2.4 seconds. The method used indicates further research along the following lines: (a) radio contact with rocket ships or pro-

jectiles far out into space, (b) study of the propagation of radio waves through the earth's atmosphere, (c) use of the moon as a reflecting surface for terrestrial radio communication, (d) more accurate determination of the radial component of the moon's orbital velocity.

Dr. Harlow Shapley, director of Harvard College Observatory, pointed out the possibility of creating and putting into operation a second "moon" of the earth, the satellite to be released from a V-2 rocket at an altitude of a few thousand miles above the earth. Also suggested are somewhat similar devices for creating a perpetual eclipse of the sun, for maintaining a high-altitude observatory, for study of cosmic rays, and for measuring incoming ultraviolet and infrared rays beyond the extreme reaches of the earth's intervening atmosphere. Apparatus has already been designed to obtain, in this manner, solar spectra and cosmic ray data. Dr. Fritz Zwicky of California Institute of Technology has devised a meteorite to be rocket-launched at a height above 100 miles.

Along similar lines, Dr. H. H. Nininger proposes the creation of an artificial meteor shower by exploding on the moon an atomic bomb carried there by a rocket. The disturbance should be of sufficient intensity to hurl fragments of the moon's surface back to the earth as a meteor shower.

On the night of October 9-10, there occurred a spectacular display of "shooting stars," visible over the greater part of the United States. As many as 60 to 100 meteors per minute were counted by observers during the period of maximum intensity. The display was considered by many to be the greatest single predicted event of the century.

There was a partial eclipse of the sun on November 23, accompanied by the appearance of two unusually large groups of sunspots.

At the spring meeting of the American Association of Variable Star Observers, announcement was made of the attainment of the millionth observation,—the culmination of 35 years of work by its members, many of whom are skilled amateur astronomers.

On July 5-7 at Cranbrook Institute near Detroit, amateur astronomers from all parts of the United States met for their fourth national convention. Announcement was made of the imminent formation of a federation of amateur societies, a plan first conceived in 1939 by the New York City Amateur Astronomers Association for the purpose of public education in astronomy and to assist professional astronomers in certain phases of their work.

Hurstmoneaux Castle in Sussex, England, was selected as the new site of the Greenwich Observatory which, at its former location, marked the principal meridian (zero longitude) of our terrestrial globe.

The world's largest reflecting telescope, the 200" at Mt. Palomar in California, scheduled for completion early in 1947, will be used chiefly on projects requiring its great light-gathering power, such as in large-scale spectroscopic work on the brighter stars, and in studying the fainter extragalactic nebulae.

GEORGE V. PLACHY.

**ATOMIC ENERGY.** The year 1946 saw the beginning of an advance toward the alluring goal of industrial use of atomic energy.

In the preceding summer, the world had been startled by the devastating blasts at Hiroshima and Nagasaki, which gave spectacular proof of ter-

rifically concentrated energy within the nucleus of the atom, but the seeds of this momentous development had been sown many years earlier.

**Matter and Energy.** Einstein had shown in 1905 that in theory matter and energy are interchangeable, although it was not until 1932 that the validity of his theory was conclusively demonstrated by laboratory experiment. His now famous equation— $E = mc^2$ , in which  $E$  represents energy,  $m$  mass, and  $c$  the velocity of light, shows how great is the energy corresponding to a very small mass, for  $c$  is very large. According to this formula, if 20 pounds of matter could be wholly converted into energy, it would equal approximately the total energy generated by the electric power industry of the United States in a year. But in the laboratory experiments in which energy was produced from mass, by causing the fission of atomic nuclei by bombardment with fast-moving particles, the energy expended in accelerating many bullets required to produce one hit was much more than the energy recovered from the resulting fission. It became, therefore, a topic of academic debate, whether the nuclear energy known to exist could ever be made usefully available.

**The Chain-Reaction.** At last, however, shortly before the war, it was shown that one rare form of atom, the isotope of uranium known as U-235, which is radioactive, might, in favorable conditions, produce a "chain-reaction." An atom of U-235, when it undergoes fission, gives off from 1 to 3 neutrons, which are capable of producing fission in other such atoms, thus giving a self-sustaining process.

This process is analogous to an ordinary chemical reaction. In the familiar process of combustion, when carbon is heated to make it combine with oxygen in air to form carbon dioxide, energy is given off, since the atoms in the  $CO_2$  are more tightly bound together than were the carbon atoms to each other in the fuel, and the heat they produce ignites other parts of the fuel mass, so that the process continues until all the fuel is consumed. Although it is now realized that the energy produced by combustion must be accompanied by a loss of mass, such loss has never been observed. However, the application of Einstein's formula shows that the loss is too small to be measurable.

The energy produced by atomic fission is vastly greater, in proportion to the masses involved, than in combustion and the loss of mass is consequently measurable by laboratory instruments. Such measurements were made by Cockcroft and Walton in 1932, and the results were found to be in close agreement with those predicted by the Einstein formula.

**The Atomic Bomb.** At the beginning of the war, in 1939, the chain-reaction above referred to had not yet been produced, but it was realized by physicists in that year, as the result of analysis of experiments with uranium 235, that such a reaction was conceivable and possibly attainable. The fundamental phenomena which would be involved were already clearly understood, and although a formidable array of scientific and technological problems stood in the way, it was believed that with sufficient ability, persevering faith, and financial backing, there was a reasonable chance of embodying the chain-reaction of U-235 in a new and supremely powerful weapon—an atomic bomb. The physicists and engineers supplied the ability and faith, the government the financial backing, and the War Department organized and supervised the project, now known as "Manhattan District," under the command of Major General L. R. Groves. The chain

reaction was first produced at the Chicago laboratory on December 2, 1942, and the final outcome stunned the world by the blast at Hiroshima, on August 5, 1945.

The atomic bomb development had been guarded in closest secrecy, but shortly after Japan's surrender there appeared, with the approval of General Groves, an informative report by Professor H. D. Smyth, describing in considerable detail the principles involved in that development, the problems that were met, the steps taken to solve them, the methods used in the production of fissionable materials, and in short, the whole story, except for some details of apparatus design and operation and the design of the bomb itself which is still kept secret. That excellent report, entitled, "A General Account of the Development of Methods of Using Atomic Energy for Military Purposes under the Auspices of the United States Government, 1940-1945" may be referred to for much fuller detail than can be given in this article, which is aimed primarily at the steps taken in 1946 toward the industrial application of atomic energy.

For convenience in understanding those steps, part of the subject matter of the Smyth report will be briefly sketched.

**Energy from Mass.** It is known that every atom consists of a nucleus surrounded by electrons. Nearly all the mass of the atom is in the nucleus, and is made up of positive particles called protons and particles of approximately equal mass but with no electric charge, called neutrons. Only the outer shell of electrons is involved in chemical reactions, such as combustion, the nucleus remaining unchanged, but when the nucleus is penetrated by a sufficiently intense disruptive force, it flies apart, splitting the atom into two others of different kind. This is what is meant by atomic fission. While radioactive disintegration of the nucleus proceeds automatically in radioactive elements such as radium and uranium, it was not until 1919 that fission was first produced in the laboratory by Rutherford. The forces binding the elements of the nucleus together are enormous so that the energy developed at fission is very great. It is this energy which gave the atomic bomb its terrific destructive power, and it is the constructive utilization of this energy for producing industrial power that is now being vigorously attempted.

All present development starts with the relatively rare atom, uranium 235, which constitutes only 0.7% of natural uranium. Its peculiar property which gives it unique value for the purpose is that it readily absorbs a slow-moving neutron which enters it, and thus forms a new nucleus which is unstable and immediately breaks into two parts of unequal but comparable mass, which fly apart with tremendous energy. The sum of the masses of the two parts is less than that of the original atom of U-235 by  $\frac{1}{40}$ th of 1%, and it is this difference of mass which appears as energy in accordance with the Einstein formula.

That this was the process which took place when uranium was bombarded by neutrons was first suggested by Frisch and Meitner in 1939, and from this suggestion the possibility of a chain-reaction was perceived, since each atom of U-235 which undergoes fission releases from one to three neutrons to split other atoms and so continue the process.

In the atomic bomb, the reaction is instantaneous, so that the whole available energy is released in a single devastating blast. For industrial power a much lower rate of energy release is essential, and fortunately that rate is readily controllable.

But before considering the means by which the control is effected, a few more physical facts must be brought into the picture.

**Uranium and Plutonium.** Uranium 235, as has been said, is rare, and its separation from natural uranium is costly, since it cannot be accomplished by chemical means. It obviously would be more economical if natural uranium could be used, and that would increase the world's supply of atomic fuel by 140-fold. It is equally obvious that natural uranium under ordinary conditions will not support a chain-reaction, for if it did there would be no uranium left on earth today. The reason for the relative stability of natural uranium is that the neutrons emitted by the automatic fission of the small amount of U-235 are for the most part absorbed by the U-238, which constitutes nearly all the mass of natural uranium. This absorption does not result in fission but in the formation of another isotope, U-239, which is found in minute quantities in natural uranium.

It was found, however, that if the neutrons emitted by U-235, which initially have a very high velocity, are slowed down by collisions with non-absorbing atoms, they not only become more effective in producing fission of more U-235 atoms but also produce fission in U-238. The absorption of these slow neutrons by U-238 results in the formation of a new element, neptunium, which quickly changes into another new element, plutonium. Plutonium, like U-235, undergoes fission when bombarded by slow neutrons and gives off more neutrons to continue the process, and so is equally capable of maintaining a chain-reaction. By the use of these transformations all, or nearly all, of the natural uranium may be used as fuel for atomic power.

**The Nuclear "Pile."** The means by which these reactions are produced and controlled is called a nuclear reactor or "pile." Its two main elements are the fuel, that is, the fissionable material, and the so-called "moderator" for slowing down the neutrons. These elements are surrounded by a reflector to minimize the loss of neutrons from the pile, and a shield for the protection of personnel from lethal radiations emitted in the process. Control of the rate of reaction is obtained by means of rods of neutron-absorbing material, which can be pushed in to slow down the reaction or withdrawn to accelerate it. Utilization of the heat energy generated in the pile may be accomplished by a fluid or vapor heat-interchanger, which carries the heat to the power generator, which may be a steam boiler and turbine, a gas turbine, or other conventional apparatus.

Thus simply presented, it might seem that the way is clear to the immediate construction of an operative industrial power plant using atomic energy, but those familiar with the development are acutely aware of the multitudinous problems, physical, chemical, metallurgical and mechanical, which obstruct the path and which must be solved by intensive and probably prolonged effort in research and engineering before the desired goal can be reached.

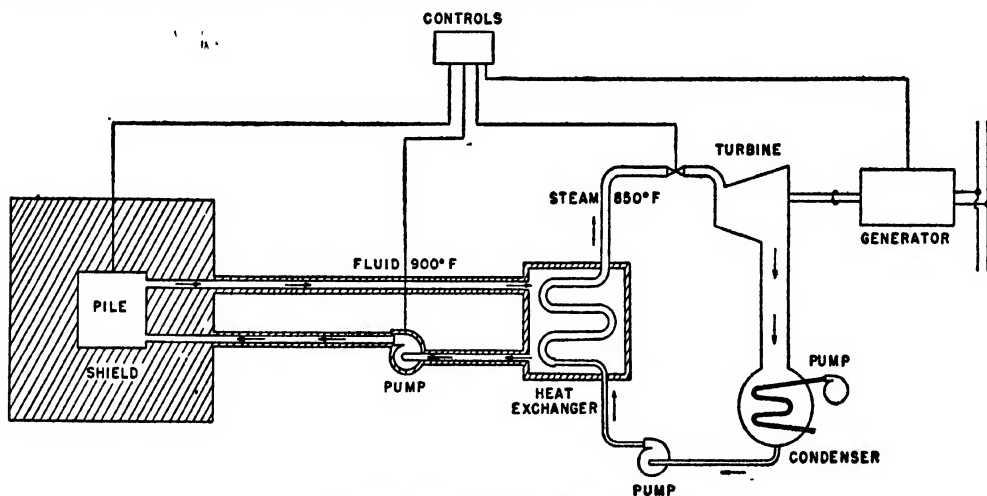

The metallurgical problems alone, involved in the development of an atomic power plant, may take years to solve. For example, the fundamental principles of the gas turbine have been well known for decades, yet it is only within the past very few years that alloys have been developed which will withstand the necessarily high operating temperatures, and so only now is the gas turbine beginning to come into use.

The probable peaceable uses of nuclear energy

power plant which appear on the horizon today may be divided into two broad classes: (a) the production of power for industrial and domestic use, and (b) the production of radioactive isotopes for biological, chemical, metallurgical, and other uses. The use of atomic explosives to produce desirable (P) results, such as blasting the ice caps in the polar regions, has also been suggested, but hardly seems likely.

**Atomic Energy Power Plant.** Let us first consider a possible form of nuclear power plant, and some of the engineering problems which must be solved to make it a reality. In a nuclear reactor, or "pile," the energy resulting from fission appears as heat, at almost any temperature at which we wish to—or rather, can—use it. We see no feasible way today of extracting this energy directly as electric power, and so must confine our thinking to ways

**Engineering Problems.** The most puzzling of the engineering problems to be solved lie in the design and construction of the "pile," and the selection of the heat transfer medium. The plutonium producing "piles" at Hanford Engineer Works, Richland, Washington, produce large quantities of heat, but are not so constructed that they can be operated at high enough temperature or pressure to make this heat commercially useful, and so the energy is dissipated in the Columbia River. Depending on the concentration of fissionable material in the "fuel" employed, the power density in a chain-reacting "pile" can obviously vary all the way from that in the low temperature Hanford "piles" to that in the atomic bomb. So the allowable power density in the pile is fixed by the rate at which heat can be carried away from it, and not by the rate at which it can be generated.

TYPICAL ATOMIC ENERGY POWER PLANT

and means of extracting the heat and converting it into electrical power through more or less conventional apparatus.

It seems reasonable now that the first atomic power plants will consist of the following major elements: (1) A nuclear reactor or power pile, in which chain reacting fission takes place, generating heat, which is absorbed by (2) a heat transfer medium, either a liquid or a gas, which will absorb the heat generated in the pile and deliver it to (3) a heat exchanger, in which the heat will be delivered to a liquid, converting it into a vapor, or to a gas, which in turn will be delivered to (4) a steam or gas turbine-electric generator unit.

According to present conceptions, the atomic energy power plant will take some such form as is shown in the accompanying diagram. The fission unit, or "pile," with its heavy shield may be connected to a heat exchanger by a transfer system comprising a fluid, and a pump for circulating it, at a temperature of the order of 900° F. In the heat exchanger, which corresponds to the usual boiler, this fluid generates steam at a somewhat lower temperature. The steam is supplied to a conventional turbine which is equipped with the usual condenser and pumps, and which drives an electric generator in the usual manner. The controls include the control of the neutron-absorbing rods in the pile, the regulation of flow in the transfer system, and the usual speed-regulation of the turbine and voltage regulation of the generator.

Therefore, the selection of the heat transfer medium will have a most important influence on a "pile" design. Many types of mediums must be studied and tested, ranging all the way from liquid metal alloys to gases.

The medium should have a high specific heat, to carry as much heat as possible for a given volume. If its latent heat of vaporization is to be utilized, the neutron absorption characteristics of unit volume of its vapor should be about the same as for unit volume of the liquid. This is desirable, to prevent changes in the ratio of liquid to vapor within the pile from altering the neutron flux intensity or distribution. The medium should have low neutron absorption characteristics. Consideration must be given to the susceptibility of the medium to atomic transmutations on the characteristics of the medium.

The medium must be of a type which will reduce to a minimum, and preferably eliminate, corrosion and erosion of the heat transfer surfaces within the pile. In addition to the ordinary problems of chemical corrosion, atomic transmutations in the heat transfer medium or surfaces may have deleterious effects, effects which will be cumulative throughout the life of the "pile." And it must not be forgotten that because of the ever-present neutron and gamma radiation, repairs will be most difficult, and inspection for incipient failure may be impossible.

The perfect heat transfer medium will probably

never be found. Practical ones certainly will be.

In the design of a given pile, the most desirable type of "fuel" must be determined. Shall it be purified natural uranium, as in the Hanford piles, or shall it be uranium enriched in U-235, or with plutonium, and if so, what degree of enrichment? It seems probable that at some time in the future we shall have both types of piles operating regularly and concurrently; the lowpower density natural uranium pile for the production of plutonium, with power produced as a by-product; and the higher power density enriched pile primarily for power production. The first might be termed a primary pile, as it utilizes the natural material and produces an artificial fissionable material as well as power. The second might be termed a secondary pile, utilizing as its active agent material produced in the primary pile, and producing power. Incidentally, in terms of the United States proposal for international control the first type of pile would definitely be in the "dangerous" class, and thus restricted to operation by the International Authority, while the second might possibly be in the "safe" classification.

In determining the type of material to be used as a "moderator" in the pile, to slow down the neutrons, both structural and nuclear-physical characteristics must be weighed. In the "piles" at Hanford, graphite has been used successfully. Heavy water, or other substances might also be employed.

Selection and design of structural elements in a "pile" involve problems not present in ordinary steam power plant construction. All material within the "pile" is subjected to heavy neutron and gamma ray bombardment, and so its stability under such radiation must be good. Low neutron absorption is very important. It, of course, must withstand the temperature and pressure conditions with absolute reliability. Throughout the design every possible precaution must be taken against failure of any element within a "pile," since repair or replacement after a "pile" has been in operation may well be impossible.

The whole "pile" must be surrounded by a radiation shield of several feet in thickness, to protect personnel from the lethal neutron and gamma radiation.

Provision must be made for inserting "fuel" and removing "ash" through the shield, bearing in mind that the "ash" will be highly radioactive and therefore must be handled with adequate shielding. It will probably be necessary to provide chemical processing equipment for reclaiming unused "fuel" from the "ash."

The rate of activity of the "pile"—that is, the rate of power generation—will undoubtedly be controlled by adjusting the position of neutron absorbing control rods extending into the "pile." These rods may be of steel containing boron, or some other suitable material.

One of the difficult problems is that of bringing the heat transfer medium into adequate contact with the active material so that the heat generated can be carried off, and yet it must be absolutely impossible for any of the active material, and especially the fission products, to be carried by the transfer medium out beyond the heavy shielding of the "pile."

Beyond the pile proper the engineering problems are much more within the scope of past experience. It is true that shielding for gamma rays will have to be provided around the heat exchanger, and around the piping and other equipment between the "pile" and heat exchanger, as the heat transfer

liquid or gas probably will become somewhat radioactive. For such shielding, however, a few inches of lead should suffice. From the heat exchanger to the turbine and around the turbine itself, no shielding should be necessary, and conventional equipment can be used.

**Economic Factors.** Now let us consider some of the economic questions involved in developing industrial and domestic power from atomic energy. Here unfortunately, our information is even less complete than in the domain of engineering.

We know that if one pound of Uranium-235, or of plutonium, undergoes complete fission, the energy liberated in the form of heat is approximately equal to that from burning 1,500 tons (3,000,000 pounds) of coal. So compared to coal at five dollars per ton, we could afford to pay \$7,500 for each pound of material which we can make undergo complete fission—that is, assuming that all other costs of operation and fixed charges on the two types of plants are equal.

But how much does a pound of fissionable material cost—or rather how much is it likely to cost when we get to the point of using it in power plants? Like so many of the questions raised in this paper, the answer is unknown.

If we consider a natural uranium "pile," for each pound of fissionable U-235, there will be 139 pounds of U-238. So if we could utilize all the U-235, one might say we should be able to pay \$7,500/140, or approximately \$55 per pound for purified natural uranium. This ought to be ample, based on pre-war prices, but with the unusual conditions existing today with respect to this material, it is impossible to estimate what the price may be. No data are generally available as to what percentage of the U-235 will undergo fission before it is necessary to remove the uranium from the "pile." Of course, some plutonium will be produced as the U-235 is dissipated. How much, and how much it costs to separate the plutonium for use in other "piles" are questions to which the answers again are not available.

All in all, it seems certain that for some time to come at least, the generation of power from nuclear fission will be much more expensive than from the more common sources of energy. However, it seems equally certain that through research and development, requiring probably a very considerable number of years, we shall find ways and means of utilizing economically for the welfare of mankind, the energy released by "splitting the atom."

Even before the cost of atomic energy is reduced enough to make it competitive with energy from conventional fuels in localities where the latter is relatively cheap, the uranium pile may find profitable applications where fuel is costly, as for instance at remote mines where much transportation cost could be saved by reducing the ore locally.

The "fuel" supply for atomic energy power plants presents no immediate problem. While we have spoken of U-235 as a rare form of atom, natural uranium, which is now available as "fuel" by means of the plutonium transformation, is not a rare element. It has been estimated that the deposits of uranium exceed the total of the world's deposits of silver, mercury and antimony combined. Also, thorium, which is more abundant than uranium, while it now cannot be used alone to produce atomic energy, may be used for that purpose in combination with uranium and so enlarge our supply of atomic "fuel."

The efficiency of the pile is reduced by the

escape or unproductive absorption of neutrons. The percentage of escaping neutrons decreases as the volume of the pile increases, which is the reason why there is a lower limit to the economic size of pile. Some neutrons are necessarily absorbed by the moderator, by the heat-transfer fluid, and by the structural materials used in the pile. In addition to this, certain materials, which may be present in very small quantities as impurities, may be very active absorbers of neutrons, and so may act as poisons which, if present in large enough amounts, would stop the chain-reaction. A material of this sort is boron, which is often present as an impurity in graphite. This means that particular attention must be paid to the purity of the materials used in the pile. There is, however, one class of poison impurities which is inherent to the pile. We have seen that the fission fragments yield several dozen different elements, some of which absorb neutrons very readily. These fission products are accumulating whenever the pile is producing power, and eventually would poison the pile enough to stop the chain reaction. It will be necessary, therefore, to remove the active material periodically from the pile and extract the poisons. It is thought that the pile can be designed so that this need be done only at long intervals, thus making economical and practical operation of the pile possible.

All materials in the pile are continually being traversed by large numbers of neutrons and by intense gamma radiation. These radiations produce change in the atomic structure of all materials in the pile. Neutron collisions displace atoms from their normal places in the crystal lattice. New elements are formed by nuclear transmutations caused by the radiations. As a result of this the physical properties of all materials in the pile may be profoundly affected after long-continued operation. The term "radiation stability" refers to the changes produced in materials by such exposure. This is a subject which will demand a good deal of experimental study before deciding on the materials to be used in an atomic power pile.

**Safeguards.** It is necessary that any discussion of a uranium power pile should place a great deal of emphasis on the safety requirements which must be fulfilled by the shielding, but it should not be inferred from this that the operation of such a pile is an extremely hazardous undertaking. The hazards peculiar to the pile may be divided into three groups: (1) the possibility of the chain-reaction getting out of control and producing something like a violent boiler explosion; (2) hazards from the radioactivity of the pile in normal operation; (3) hazards incurred from radioactivity in transferring material to or from the pile. As regards (1), extra safety control rods can be provided which can be automatically inserted in the pile whenever the energy output of the pile increases too fast, and which will absorb so many neutrons that the chain-reaction cannot take place. As regards (2) and (3), measuring instruments are available which can detect much smaller amounts of the dangerous radiations than are toxic to humans, so that the hazards from this cause can be detected and controlled long before they become dangerous.

**Applications of Atomic Power.** As to probable or possible applications of atomic power, one of the most likely seems to be propulsion of naval vessels. It is conceivable that an atomic-powered ship might have a range of hundreds of thousands of miles without refueling. This, of course would be of great importance to a navy, and might readily justify a high first cost and high fuel cost. The

heavy shielding required for the nuclear unit would not be a serious handicap on a large ship. Atomic power sounds particularly attractive for submarine use, providing space can be made available for the shielding.

As development proceeds, following application on shipboard may come land power plants in locations where power is needed but ordinary fuel cost is very high.

Application of an atomic power plant on a locomotive seems remote and perhaps impossible because of the space and weight requirements of the shields. The same factor makes the application to inhabited aircraft an extremely difficult problem. And it must be obvious that direct use of atomic energy in an automobile, or in one's home, is for the foreseeable future entirely out of the question.

**Radioactive Isotopes.** Now let us turn briefly to another application of nuclear energy which may well bring as great or greater benefits to humanity than the production of industrial power. This is the manufacture of radioactive isotopes through the exposure of selected materials to the high-intensity neutron flux in a nuclear reactor. The useful applications of such isotopes already being made and others that can be foreseen are very numerous, and research is certain to reveal many more. The utility depends on the two facts, that radioactive atoms behave chemically like ordinary atoms and that their presence in minute amounts is readily detectable without a destructive analysis of the sample. For radioactive analysis the sample need not be purified. The sensitivity as compared with chemical analysis, is increased 100-million-fold. The use of a radioactive isotope of an element makes it possible to follow that element through a complicated chemical or metallurgical process, even when it is present only in high dilution.

Similarly in biological studies radioactive isotopes may be used as "tracers." Thus the iodine intake of the thyroid; the concentration of salts in blood plasma and cells; chemical processes in plants, such as photosynthesis; and many other biological processes may be readily studied, with the hope of alleviating many human ailments and increasing the yield of crops.

Moreover, radioactivity initiates many chemical reactions. This may prove important in the chemical industry, and has already proved helpful in therapy. Radioactive phosphorus and iodine are the most effective therapeutic agents yet known in the treatment of certain diseases. The radium treatment of cancer is well known, and the power pile makes available relatively large quantities of radioactive material to supplement the small amount of radium in existence. Such material may also be used in place of x-rays for producing and studying genetic changes, for some kinds of radiography, or for dissipating annoying static charges on machines.

Certainly we are able to foresee now only a small fraction of the possible uses of these products of the "atomic pile." It is a fascinating field for speculation.

**Research.** The chief engineering problems, which are now foreseen and which must be solved before economic industrial power may be derived from atomic energy, have been briefly sketched in the preceding discussion. These problems are posed by our present knowledge of the basic phenomena of nuclear fission. As that knowledge is advanced and expanded by research, new technological aspects may appear to complicate or simplify the development, and research is being vigorously pushed in many quarters and by many investigators both in this country and abroad.

Four laboratories have been authorized by the War Department, and two of them are already in operation under government sponsorship. One of these is the Clinton Laboratory at Oak Ridge, Tennessee, now operated by the Monsanto Chemical Company, and the other the Argonne National Laboratory at Chicago, operated jointly by a number of midwest universities. Two others are being rushed to completion—the Brookhaven National Laboratory on Long Island, New York, to be operated by eastern universities, and the Knolls Atomic Power Laboratory at Schenectady, New York, to be operated by General Electric Company. Meanwhile the production of fissionable material is continuing at Oak Ridge and at Hanford, Washington, where the plants have been taken over by the Tennessee Eastman and Union Carbide and Chemical Companies and by General Electric Company, respectively.

**Tools for Research.** Research is directed primarily toward a fuller knowledge of nuclear reactions. Powerful tools for producing nuclear fissions are already in operation and others are being developed. The earliest to be constructed was the cyclotron, which accelerates positive ions in a direct current magnetic field by means of electrostatic forces to velocities corresponding to many millions of volts. This was followed by the betatron, which accelerates electrons in an alternating current magnetic field by means of electro-magnetic forces, and produces x-rays of 100,000,000 volts and more. The principles of both cyclotron and betatron have been described in past years.

The energy obtainable from a betatron of given size has recently been increased by providing a direct current bias of the magnetic field, which makes it possible to accelerate the electrons throughout nearly one-half of the magnetic cycle, instead of one-quarter as in the unbiased betatron.

A newer device, the synchrotron employs a magnet and a doughnut-shaped tube similar to those of the betatron, but the vacuum tube incorporates a high frequency resonant cavity energized by a radio frequency oscillator. Electrons are injected into this tube at high energies and take a circular pattern and acquire a stable orbit as in the betatron. The chief accelerating force, however, is provided by the resonant cavity, through the gaps of which electrons acquire multiple accelerations in the electric field, in a manner somewhat similar to that in the cyclotron. By the use of this principle, it is hoped to accelerate particles to still higher energies than in the biased betatron of equal weight.

Because the acceleration is chiefly provided by the electric field, there is a considerable change in the diameter of the orbit during the complete acceleration cycle. This leads to a cross-section of tube which is awkward to construct. To overcome this difficulty a still newer device is under development, which consists of a small betatron built into the synchrotron. In this device the betatron supplies electrons at two million volts energy to the synchrotron cavity. Since these electrons are already moving with 98% of the speed of light, no great change in orbit diameter occurs with subsequent acceleration.

A still further alternative method of accelerating particles is the wave guide accelerator or linear accelerator. Radar work during the war greatly advanced the art of radio circuitry and electronics at very high frequencies. From this work has come a very much fuller understanding of the conduction of electric waves through hollow guides, as well as the development of tubes for the production of

microwave radio energy at high power levels. These two advances provide the basic elements of a linear accelerator.

In one form this device may employ a hollow tube energized by a very high frequency oscillator. Since even the very high power levels available are insufficient for continuous operation, the radio frequency power is supplied on a pulse cycle. Electrons are injected into one end of this wave guide so as to stay in phase with the phase velocity in the guide and are accelerated thereby to high energies. To adjust the phase velocity in the guide to the increasing velocity of the particle during acceleration, the accelerating tube is generally built as a series of tuned cavities. The electric constants of these cavities permit a satisfactory choice of traveling phase velocity so that electrons or heavy particles may be injected and successfully accelerated as they traverse the succession of cavities on their straight path down the axis of the wave guide.

The principal wave-guide accelerators sprang up almost simultaneously in a great many laboratories at the end of the war as a rather obvious application of radar technique. Although quite a number of linear accelerators are now being explored in this country, work has not gone far enough to permit a real evaluation of the advantages or disadvantages of the method.

With such devices the fundamentals of nuclear reactions are receiving intensive study by many of the ablest investigators. Phenomena, which before were observable only in the cosmic rays, may now be produced and studied in the laboratory. Some of the observations have revealed new and complex reactions which pose riddles as yet unsolved, and which will require for full understanding much more research and perhaps the development of new instruments and methods for studying them.

With such research, our knowledge of nuclear phenomena is certain to expand rapidly, and to throw new light on the technological developments which must precede the economic production of industrial power from atomic energy.

**Policies.** Because of the terrible potentialities for destruction inherent in the use of atomic energy in war, considerations of national security bind research and technological development indissolubly to national policies, both domestic and in the United Nations. For this reason the advances in formulation of policies play a dominant role in all atomic energy developments, and therefore the technical report of the Lillienthal Committee and the Baruch report to the United Nations should be read as a supplement to this article. See **ATOMIC ENERGY, PROPOSALS AND REPORTS ON.**

HARRY A. WINNE and L. A. HAWKINS.

**ATOMIC ENERGY, Proposals and Reports on.** The atomic bomb that destroyed Hiroshima in September, 1945 caused not only destruction unparalleled in the history of mankind, but the most fateful problem ever posed. All nations realized that the hoped-for durable peace and the possible survival of civilization depended on finding a suitable and acceptable control for atomic energy.

In recognition of the devastating nature of the new weapon, the original three joint owners of atomic knowledge, the United States, Great Britain, and Canada formulated an expedient plan in Washington during November, 1945. It was decided that the "know how" of atomic bomb manufacture would temporarily remain with the three originators, but would be shared with other nations after effective international controls could be

devised. The plan recommended that a special commission be established within the United Nations to manage the controls, outlaw the atomic bomb as a weapon, and insure the use of atomic energy only for peaceful purposes. The commission would have the authority to inspect all countries to protect complying states against violations and evasions of the agreement. In addition to its duties of safeguarding and inspection, the commission would sponsor the exchange of scientific information between the various nations and would recommend any measures necessary to restrict atomic energy to peaceful use. In concluding their statement, the three signators expressed the hope that the proposed free exchange of knowledge would be adopted by all nations, "thereby creating an atmosphere of reciprocal confidence."

**Creation of the United Nations Commission on Atomic Energy.** A month after the Washington Conference closed, the Foreign Ministers of the Union of Soviet Socialist Republics, the United Kingdom, and the United States met at Moscow and agreed on a definite proposal for the establishment by the United Nations of a commission on atomic energy and related matters. The designated purpose of the commission was restricted to an inquiry into the problems raised by the discovery of atomic energy and the making of recommendations.

Since the Charter of the United Nations furnished no means for dealing with the control of atomic energy, the members of the Moscow Conference instituted their own procedure to cope with the problem. They invited Canada (who shared in the development of atomic energy) and the other permanent members of the United Nations Security Council, France and China, to sponsor a resolution at the first session of the General Assembly, calling upon the Assembly to create the United Nations Atomic Energy Commission. The resolution drafted at Moscow was added to General Assembly agenda on January 4, 1946 and approved with no dissenting votes on January 24. Following is the text of the Assembly Resolution establishing the Commission on Atomic Energy.

RESOLVED by the General Assembly of the United Nations to establish a Commission, with the composition and competence set out hereunder, to deal with the problems raised by the discovery of atomic energy and other related matters.

#### 1. Establishment of the Commission

A Commission is hereby established by the General Assembly with the terms of reference set out under section 5 below.

#### 2. Relations of the Commission with the Organs of the United Nations

(a) The Commission shall submit its reports and recommendations to the Security Council, and such reports and recommendations shall be made public unless the Security Council, in the interest of peace and security, otherwise directs. In the appropriate cases the Security Council should transmit these reports to the General Assembly and the Members of the United Nations, as well as to the Economic and Social Council and other organs within the framework of the United Nations.

(b) In view of the Security Council's primary responsibility under the Charter of the United Nations for the maintenance of international peace and security, the Security Council shall issue directions to the Commission in matters affecting security. On these matters the Commission shall be accountable for its work to the Security Council.

#### 3. Composition of the Commission

The Commission shall be composed of one representative from each of those States represented on the Security Council, and Canada when that State is not a member of the Security Council. Each representative on the Commission may have such assistance as he may desire.

#### 4. Rules of procedure

The Commission shall have whatever staff it may deem necessary, and shall make recommendations for its rules

of procedure to the Security Council, which shall approve them as a procedural matter.

#### 5. Terms of reference of the Commission

The Commission shall proceed with the utmost dispatch and inquire into all phases of the problem, and make such recommendations from time to time with respect to them as it finds possible. In particular, the Commission shall make specific proposals:

(a) for extending between all nations the exchange of basic scientific information for peaceful ends;

(b) for control of atomic energy to the extent necessary to insure its use only for peaceful purposes;

(c) for the elimination from national armaments of atomic weapons and of all other major weapons adaptable to mass destruction;

(d) for effective safeguards by way of inspection and other means to protect complying States against the hazards of violations and evasions.

The work of the Commission should proceed by separate stages the successful completion of each of which will develop the necessary confidence of the world before the next stage is undertaken.

The Commission shall not infringe upon the responsibilities of any organ of the United Nations, but should present recommendations for the consideration of those organs in the performance of their tasks under the terms of the United Nations Charter.

**The Lilienthal Report.** On January 7, 1946, Secretary of State James F. Byrnes set up a State Department Committee on Atomic Energy, headed by Dean Acheson, Under Secretary of State. The other members of the Committee were Dr. Vannevar Bush and Dr. James B. Conant of the Office of Scientific Research and Development, Major General Leslie R. Groves, head of the Manhattan District Project, the organization which produced the bomb, and Mr. John J. McCloy, former Assistant Secretary of War.

The Committee appointed on January 23 a Board of Consultants with the following members:

Mr. David E. Lilienthal, Chairman of the Tennessee Valley Authority, who acted as chairman of the consulting board. Mr. Chester I. Barnard, President of the New Jersey Bell Telephone Company. Dr. J. Robert Oppenheimer, of the California Institute of Technology and the University of California. Dr. Charles Allen Thomas, Vice-President and Technical Director, Monsanto Chemical Company. Mr. Harry A. Winne, Vice-President in Charge of Engineering Policy, General Electric Company.

The report of the Board of Consultants was published on March 16 by the State Department, with an introduction by Secretary of State Byrnes stating that the document was a "suitable starting point for the informed public discussion which is one of the essential factors in developing sound policy. The document is being made public not as a statement of policy but solely as a basis for such discussion."

The more important recommendations of the "Lilienthal Report" centered on the proposals that an Atomic Development Authority be established to control exclusively the world's stock of uranium and thorium, as well as all activities in relation to their radioactive properties. The report closed with an analysis of the procedures whereby the "present American advantage" might be retained while other nations carried on research to solve related scientific and industrial problems.

Following are excerpts from the "Lilienthal Report" which form the underlying basis of the document:

#### Section I: Background of the Problem

This report is a preliminary study of the international control of atomic energy. It has been prepared to contribute to the clarification of the position of the U.S. Representative on the United Nations Commission on atomic energy set up by resolution of the United Nations General Assembly to inquire into all phases of this question.

*Here follow discussions on the commitment for international control, early ideas on safeguards, the technical problem of inspection, and human factors of inspection.*

#### Section II: Principal Considerations in Developing a System of Safeguards

At the outset of our inquiry we were preoccupied with some way of making an inspection system provide security. This is a preoccupation that is apparently common to most people who have seriously tried to find some answer to the extraordinarily difficult problem presented by the atomic bomb. But as day after day we proceeded with our study of the facts concerning atomic energy, and reflected upon their significance, we were inescapably driven to two conclusions: (a) the facts preclude any reasonable reliance upon inspection as the primary safeguard against violations of conventions prohibiting atomic weapons, yet leaving the exploitation of atomic energy in national hands; (b) the facts suggest quite clearly a reasonable and workable system that may provide security, and even beyond security, foster beneficial and humanitarian uses of atomic energy.

#### *What Should be the Characteristics of an Effective System of Safeguards:*

It may be helpful to summarize the characteristics that are desirable and indeed essential to an effective system of safeguards; in other words, the criteria for any adequate plan for security.

a. Such a plan must reduce to manageable proportions the problem of enforcement of an international policy against atomic warfare.

b. It must be a plan that provides unambiguous and reliable danger signals if a nation takes steps that do or may indicate the beginning of atomic warfare. Those danger signals must flash early enough to leave time adequate to permit other nations—alone or in concert—to take appropriate action.

c. The plan must be one that if carried out will provide security; but such that if it fails or the whole international situation collapses, any nation such as the United States will still be in a relatively secure position, compared to any other nation.

d. To be genuinely effective for security, the plan must be one that is not wholly negative, suppressive, and police-like. We are not dealing simply with a military or scientific problem but with a problem in statecraft and the ways of the human spirit. Therefore the plan must be one that will tend to develop the beneficial possibilities of atomic energy and encourage the growth of fundamental knowledge, stirring the constructive and imaginative impulses of men rather than merely concentrating on the defensive and negative. It should, in short, be a plan that looks to the promise of man's future well-being as well as to his security.

e. The plan must be able to cope with new dangers that may appear in the further development of this relatively new field. In an organizational sense therefore the plan must have flexibility and be readily capable of extension or contraction.

f. The plan must involve international action and minimize rivalry between nations in the dangerous aspects of atomic development.

The facts we have come to think essential, and the elements of our thinking as we moved toward the plan we herein recommend, are set out in this section, in the form of the considerations that are relevant to an effective program for security, and that have led us to devise what we believe is an adequate plan.

#### Chapter 1, "The Problem Has Definable Boundaries,"

*defines atomic energy as the "energy that results from rearrangements in the structure of atomic nuclei of elements." The nature of the forces which hold such nuclei together and account for their stability is*

not adequately understood, but enough is known about their behavior, not only to make it certain that the energy of an atomic bomb or an atomic power plant comes from the work done by these forces when the structure of atomic nuclei is rearranged, but also to explain one major fact of decisive importance: Only in reactions of very light nuclei, and in reactions of the very heaviest, has there ever been, to the best of our knowledge, any large-scale release of atomic energy. The reasons for this can be given in somewhat oversimplified form.

#### *The Committee concludes that:*

Because the constituent raw materials of atomic energy can be limited to uranium and thorium, the control problem is further narrowed by the geological conditions under which uranium and thorium are found, and the fact that at present those elements have only a restricted commercial significance. Although they are distributed with relative abundance throughout the world, and although it is clear that many sources beyond the known supplies will be discovered, it is apparently the view of the authorities that these elements occur in high concentrations only under very special geologic conditions. This would seem to mean that the areas which need to be surveyed, to which

access must be had, and which would ultimately have to be brought under control, are relatively limited.

*The other chapters of Section II discuss the adequacy of present scientific knowledge, constructive applications of atomic energy, the elimination of international rivalry, and "Safe" and "Dangerous" activities. The Committee in a summary states that:*

1. If nations or their citizens carry on intrinsically dangerous activities it seems to us that the chances for safeguarding the future are hopeless.

2. If an international agency is given responsibility for the dangerous activities, leaving the non-dangerous open to nations and their citizens and if the international agency is given and carries forward affirmative development responsibility, furthering among other things the beneficial uses of atomic energy and enabling itself to comprehend and therefore detect the misuse of atomic energy, there is good prospect of security.

#### Section III: Security Through International Cooperative Development

In the preceding sections of this report we have outlined the course of our thinking in an endeavor to find a solution to the problems thrust upon the nations of the world by the development of the atomic bomb—the problem of how to obtain security against atomic warfare, and relief from the terrible fear which can do so much to engender the very thing feared.

As a result of our thinking and discussions we have concluded that it would be unrealistic to place reliance on a simple agreement among nations to outlaw the use of atomic weapons in war. We have concluded that an attempt to give body to such a system of agreements through international inspection holds no promise of adequate security.

And so we have turned from mere policing and inspection by an international authority to a program of affirmative action, of aggressive development by such a body. This plan we believe holds hope for the solution of the problem of the atomic bomb. We are even sustained by the hope that it may contain seeds which will in time grow into that cooperation between nations which may bring an end to all war.

The program we propose will undoubtedly arouse skepticism when it is first considered. It did among us, but thought and discussion have converted us.

It may seem too idealistic. It seems time we endeavor to bring some of our expressed ideals into being.

It may seem too radical, too advanced, too much beyond human experience. All these terms apply with peculiar fitness to the atomic bomb.

In considering the plan, as inevitable doubts arise as to its acceptability, one should ask oneself "What are the alternatives?" We have, and we find no tolerable answer.

The following pages contain first a brief summary of the plan we recommend, and then an expansion going into some detail.

*Summary of Proposed Plan*—The proposal contemplates an international agency conducting all intrinsically dangerous operations in the nuclear field, with individual nations and their citizens free to conduct, under license and a minimum of inspection, all non-dangerous, or safe, operations.

The international agency might take any one of several forms, such as a UNO Commission, or an international corporation or authority. We shall refer to it as Atomic Development Authority. It must have authority to own and lease property, and to carry on mining, manufacturing, research, licensing, inspecting, selling, or any other necessary operations.

This chapter is not an attempt to write a corporate charter for such an international agency. It is the aim, rather, to show that such a charter can be written in workable terms, and that the nature of the organization and its functions will have decisive consequences for world security. We are satisfied that the differences between national and international operations can be exploited to make the problem of atomic energy manageable. This idea, we think, can become as familiar as the fact that the differences between individual enterprise and corporate enterprise have important consequences in the conduct of business.

If we are to do anything constructive in relation to atomic energy it must inevitably be novel and immensely difficult. We think that the weeks we have spent in analysis of the problem have made it appear somewhat less difficult and somewhat less novel. A succession of such processes will be necessary, each building on the preceding analysis, before even the major ramifications of the problem can be understood and the major questions partially answered. What is chiefly important now is to describe the right course of action in terms sufficiently practical and valid to show that the further exploration is worthwhile.

The proposal contemplates an international agency with exclusive jurisdiction to conduct all intrinsically dangerous operations in the field. This means all activities relating to raw materials, the construction and operation of

production plants, and the conduct of research in explosives. The large field of non-dangerous and relatively non-dangerous activities would be left in national hands. These would consist of all activities in the field of research (except on explosives) and the construction and operation of non-dangerous power-producing piles. National activities in these fields would be subject to moderate controls by the international agency, exercised through licensing, rules and regulations, collaboration on design, and the like. The international agency would also maintain inspection facilities to assure that illicit operations were not occurring, primarily in the exploitation of raw materials. It would be a further function of the Atomic Development Authority continually to reexamine the boundary between dangerous and non-dangerous activities. For it must be recognized that although the field is subject to reasonable division, the dividing line is not sharp and may shift from time to time in either direction.

The development agency itself would be truly international in character. Its staff would be recruited on an international basis. Its functions would be such as to attract a caliber of personnel comparable to our own activities in raw materials during the war and our own primary production and experimental work. It would be set up as one of the subsidiary agencies of the United Nations, but it would have to be created by a convention or charter establishing its policies, functions, and authority in comprehensive terms.

Whatever the formal organization, its integration with national structure would of course be one of the major problems. Measures to assure the proper degree of accountability to the United Nations and to individual nations, measures to assure that individual nations would have ample opportunity to be informed of the agency's activities, measures to make the agency responsive to the changing needs of nations—all these would have to be worked out with extraordinary care and ingenuity. But certainly our experience with business and government institutions, national and international, would afford a wealth of guidance in the development of such measures.

In the actual conduct of its operations the development organization would at all times be governed by a dual purpose, the promotion of the beneficial use of atomic energy and the maintenance of security. We believe that much can be done in a convention or charter to make these purposes concrete and explicit, to draw the line between the dangerous and the non-dangerous, to establish the principles determining the location of stockpiles and plants so that a strategic balance may be maintained among nations, to establish fair and equitable financial policies so that the contributions of nations to, and their receipt of benefits from, the organization will be justly apportioned. The most careful and ingenious definitions will be required in order to accomplish these purposes.

In what follows we shall attempt to develop and expand the foregoing statement of essentials.

We can best visualize the Atomic Development Authority in terms of the answer to these concrete questions:

(1) What will be the functions of the agency; what are the things that it will do?

(2) What kind of organization is necessary to carry out these functions?

(3) How will the organization be related to the United Nations and the individual nations that it will represent?

(4) What policies will guide the agency in determining its manifold actions?

The two chapters in this section are devoted to the (1) proprietary and regulatory functions of Atomic Development Authority in the field of raw materials, production plants, research activities, licensing activities, and inspection activities, and (2) organization and policies of Atomic Development Authority, in which the Committee sets forth the basic considerations for an Atomic Development Authority:

The fundamentals governing the Atomic Development Authority must of course be those which have been so well stated in the resolution of January 18, 1946 setting up the United Nations Atomic Energy Commission, that is, the strengthening of security and the promotion of the beneficial use of atomic energy. In our report we have adopted as the first principle in the accomplishment of these fundamental objectives the proposition that intrinsically dangerous activities in the field must not be left open to national rivalry but must be placed in truly international hands. To establish the boundaries between international and national action, we have grasped the fortunate circumstance that a dividing line can be drawn between dangerous and non-dangerous activities. We have emphasized that not the least in the fortunate circumstances that we have observed is the fact that the field of non-dangerous activities is so challenging that it provides an opportunity to avoid such centralization of authority as might make the price of security seem too high. In this connection it is important that a purposeful effort should be made to keep as broad and diversified as possible the field of activities which is left in national and private hands. Every effort must be made to avoid centralizing exclusively in the Authority any more activities than are essential for purposes of security.

#### Section IV: The Transition for International Control

*The Committee summarizes this section as follows:*

In this section we have been discussing the problem of transition to international control as it affects the security of the United States. During this transition the United States' present position of monopoly may be lost somewhat more rapidly than would be the case without international action. But without such action the monopoly would in time disappear in any event. Should the worst happen and, during the transition period, the entire effort collapse, the United States will at all times be in a favorable position with regard to atomic weapons. This favorable position will depend upon material things; less and less will it rest upon keeping nations and individuals ignorant.

When fully in operation the plan herein proposed can provide a great measure of security against surprise attack. It can do much more than that. It can create deterrents to the initiation of schemes of aggression, and it can establish patterns of cooperation among nations, the extension of which may even contribute to the solution of the problem of war itself. When the plan is in full operation there will no longer be secrets about atomic energy. We believe that this is the firmest basis of security; for in the long term there can be no international control and no international cooperation which does not presuppose an international community of knowledge.

The Baruch Proposals for an International Atomic Development Authority. Bernard M. Baruch, who was appointed American representative to the United Nations Commission by President Harry S. Truman on March 18, submitted the United States' proposals for the control of atomic energy to the United Nations on June 14. Broadly patterned on the "Lilienthal Report," Mr. Baruch widened the base of the International Atomic Development Authority to include all forms of control. The "Lilienthal Report" restricted the authority to international ownership. In the design of the Baruch proposals the Authority would be empowered to survey the world's supply of uranium and thorium, to exercise complete monopoly of the production of fissionable materials, and to control research in the field of atomic explosives by licensing other authorities for the exploitation of peaceful activities. The power of international inspection would demand free access to any party of any country.

After an urgent plea for a peaceful world, Mr. Baruch said that the creation of an effective system of control and the renunciation of the atomic bomb as a weapon would be followed by an end to the manufacture of atomic bombs, disposal of existing bombs and delivery to the Authority of full information regarding the "know how" for the production of atomic energy.

The following measures were submitted by Mr. Baruch as representing the fundamental features of the United States plan:

1. **General.** The Authority should set up a thorough plan for control of the field of atomic energy, through various forms of ownership, dominion, licenses, operation, inspection, research, and management by competent personnel. After this is provided for, there should be as little interference as may be with the economic plans and the present private, corporate, and state relationships in the several countries involved.

2. **Raw Materials.** The Authority should have as one of its earliest purposes to obtain and maintain complete and accurate information on world supplies of uranium and thorium and to bring them under its dominion. The precise pattern of control for various types of deposits of such materials will have to depend upon the geological, mining, refining, and economic facts involved in different situations.

The Authority should conduct continuous surveys so that it will have the most complete knowledge of the world geology of uranium and thorium. Only after all current information on world sources of uranium and thorium is known to us all can equitable plans be made for their production, refining, and distribution.

3. **Primary Production Plants.** The Authority should exercise complete managerial control of the production of fissionable materials. This means that it should control and operate all plants producing fissionable materials in dangerous quantities and must own and control the product of these plants.

4. **Atomic Explosives.** The Authority should be given sole and exclusive right to conduct research in the field of atomic explosives. Research activities in the field of atomic explosives are essential in order that the Authority may keep in the forefront of knowledge in the field of atomic energy and fulfil the objective of preventing illicit manufacture of bombs. Only by maintaining its position as the best-informed agency will the Authority be able to determine the line between intrinsically dangerous and non-dangerous activities.

5. **Strategic Distribution of Activities and Materials.** The activities entrusted exclusively to the Authority because they are intrinsically dangerous to security should be distributed throughout the world. Similarly, stockpiles of raw materials and fissionable materials should not be centralised.

6. **Non-Dangerous Activities.** A function of the Authority should be promotion of the peacetime benefits of atomic energy.

Atomic research (except in explosives), the use of research reactors, the production of radioactive tracers by means of non-dangerous reactors, the use of such tracers, and to some extent the production of power should be open to nations and their citizens under reasonable licensing arrangements from the Authority. Denatured materials, whose use we know also requires suitable safeguards, should be furnished for such purposes by the Authority under lease or other arrangement. Denaturing seems to have been overestimated by the public as a safety measure.

7. **Definition of Dangerous and Non-Dangerous Activities.** Although a reasonable dividing line can be drawn between dangerous and non-dangerous activities, it is not hard and fast. Provision should, therefore, be made to assure constant reexamination of the questions and to permit revision of the dividing line as changing conditions and new discoveries may require.

8. **Operations of Dangerous Activities.** Any plant dealing with uranium or thorium after it once reaches the potential of dangerous use must be not only subject to the most rigorous and competent inspection by the Authority, but its actual operation shall be under the management, supervision, and control of the Authority.

9. **Inspection.** By assigning intrinsically dangerous activities exclusively to the Authority, the difficulties of inspection are reduced. If the Authority is the only agency which may lawfully conduct dangerous activities, then visible operation by others than the Authority will constitute an unambiguous danger signal. Inspection will also occur in connection with the licensing functions of the Authority.

10. **Freedom of Access.** Adequate ingress and egress for all qualified representatives of the Authority must be assured. Many of the inspection activities of the Authority should grow out of, and be incidental to, its other functions. Important measures of inspection will be associated with the tight control of raw materials, for this is a keystone of the plan. The continuing activities of prospecting, survey, and research in relation to raw materials will be designed not only to serve the affirmative development functions of the Authority but also to assure that no surreptitious operations are conducted in the raw-materials field by nations or their citizens.

11. **Personnel.** The personnel of the Authority should be recruited on a basis of proven competence but also as far as possible on an international basis.

12. **Progress by Stages.** A primary step in the creation of the system of control is the setting forth, in comprehensive terms, of the functions, responsibilities, powers, and limitations of the Authority. Once a charter for the Authority has been adopted, the Authority and the system of control for which it will be responsible will require time to become fully organized and effective. The plan of control will, therefore, have to come into effect in successive stages. These should be specifically fixed in the charter or means should be otherwise set forth in the charter for transitions from one stage to another, as contemplated in the resolution of the United Nations Assembly which created this Commission.

13. **Disclosures.** In the deliberations of the United Nations Commission on Atomic Energy, the United States is prepared to make available the information essential to a reasonable understanding of the proposals which it advocates. Further disclosures must be dependent, in the interests of all, upon the effective ratification of the treaty. When the Authority is actually created, the United States will join the other nations in making available the further information essential to that organization for the performance of its functions. As the successive stages of international control are reached, the United States will be prepared to yield, to the extent required by each stage, national control of activities in this field to the Authority.

14. **International Control.** There will be questions about the extent of control to be allowed to national bodies, when the Authority is established. Purely national authorities for control and development of atomic energy should to the extent necessary for the effective operation of the Authority be subordinate to it. This is neither an endorsement nor a disapproval of the creation of national au-

thorities. The Commission should evolve a clear demarcation of the scope of duties and responsibilities of such national authorities.

**The U.S.S.R. Proposals.** With the exception of the Union of Soviet Socialist Republics and Poland, the Baruch plan was accepted by all negotiating nations. The proposals of the Soviet representative, Mr. Andrei A. Gromyko, which were presented at the second session of the Commission on June 19, differed fundamentally from that of the United States. While the Baruch plan provided for disposal activities only after effective safeguards had been established, the Soviet proposals demanded the immediate outlawing of the atomic bomb and the destruction of all stocks of atomic energy weapons within a period of three months.

Rather than establish an Authority with the power to investigate atomic activities, the Soviet plan put the outlawing of atomic weapons on a moral plane whereon each nation would be entrusted to punish its own citizens for infractions of an outlaw treaty.

The pertinent points of the Soviet plan, as listed in the United Nations' Secretary-General's report are as follows:

In order to carry out the decision of the General Assembly of January 24, one of the first measures should be a study of the question of the conclusion of an international agreement to forbid the production and use of weapons based upon the use of atomic energy for the purposes of mass destruction.

#### Six "essentials" cited

The essentials of such an agreement are as follows:

1. The production and use of a weapon based upon the use of atomic energy shall be forbidden.
2. Within a period of three months from the entry into force of the agreement all stocks of atomic energy weapons shall be destroyed.
3. Any violation of the agreement shall be regarded as a serious threat against humanity.
4. Violation of the terms of the agreement shall be severely punished under the domestic legislation of the contracting parties.
5. The agreement shall be of indefinite duration, coming into force after approval by the Security Council, and after ratification by all the permanent members of the Security Council.
6. All States (whether Members or not of the United Nations) shall be obliged to fulfil all provisions of the agreement.

In pursuit of the aims indicated in the decision of the General Assembly 'to proceed with the utmost despatch and enquire into all phases of the problem,' the representative of the Union of Soviet Socialist Republics proposed to establish two committees. Each committee would be composed of one representative of each State represented on the Commission. Each representative could have advisers. The Rules of Procedure of the committees should be drawn up by the Atomic Energy Commission.

#### Would prepare recommendations

The first committee would be for the exchange of scientific information. Among the tasks of this committee would be that of elaborating recommendations concerning practical measures for the organization of exchange of information: (1) concerning the contents of scientific discoveries connected with the splitting of the atom and other discoveries connected with the obtaining and use of atomic energy; (2) concerning the technology and the organization of technological processes for obtaining and using atomic energy; (3) concerning the organization and method of industrial production of atomic energy and the use of such energy; (4) concerning the forms, sources and location of raw materials necessary for obtaining atomic energy.

The task of the second committee would be to prepare recommendations on the following subjects concerning the prevention of the use of atomic energy for the harm of humanity:

1. The preparation of a draft international agreement to outlaw weapons based upon the use of atomic energy and to forbid the production and use of such weapons and all similar forms of weapons destined for mass destruction.
2. The elaboration and creation of methods to forbid the production of weapons based upon the use of atomic energy and to prevent the use of atomic weapons and all other similar weapons of mass destruction.
3. Measures, systems and organization of control in the use of atomic energy to ensure the observance of the

above-mentioned conditions in the international agreement to outlaw atomic weapons.

4. The elaboration of measures for application against the unlawful use of atomic energy.

On December 30 the United Nations Atomic Energy Commission approved a plan for international atomic control that exactly conformed with the proposal submitted by Mr. Baruch to the United Nations on June 14. The Soviet Union and Poland abstained from voting.

As approved, the plan requested the creation of an international Authority or agency, drawn up by multilateral treaties, to outlaw the production and use of atomic weapons, with no veto by any of the United Nations on the operations of the Authority or punishment of violators. The Authority would have unrestricted control of atomic research for destructive purposes and its agents would have the right to make inspections of all those nations subscribing to the agreement.

**AUSTRALIA.** A self-governing dominion of the British Commonwealth of Nations. Capital, Canberra. Australia proper includes 6 states and two territories, with a total area of 2,974,581 square miles and an estimated population (March 31, 1945) of 7,364,841. The Commonwealth of Australia also has administrative control of Papua, Norfolk Island, the Ashmore and Cartier Islands, the uninhabited Australian Antarctic Territory and Nauru (mandated to the British Empire). The territory of New Guinea, comprising northeast New Guinea, the Bismarck Archipelago and part of the Solomon Islands, is administered by Australia under mandate.

**Government.** Executive power is vested in a Governor-General appointed by the Crown and in a ministry responsible to the Federal Parliament. There is a Senate of 36 members (6 from each state) elected for 6 years and renewed by half every three years, and a House of Representatives of 75 members apportioned among the states on a population basis and elected for three years. Governor-General, the Duke of Gloucester (assumed office early in 1945 and recalled to Britain for official duties early in 1947). Prime Minister Joseph B. Chifley, chosen by the Labor Party to succeed John Curtin, who died in 1945, and continued in office as a result of the general election of September 28, 1946.

**Events, 1946.** Australia's first full year of peace was marked by the return of the Labor Government to office as a result of the general election, vigorous and extensive participation by the country's representatives in international conferences, and progress towards postwar reconstruction without encountering some of the difficulties met by other victorious countries.

On September 28 more than 4,500,000 Australian voters went to the polls to elect the Commonwealth's 18th Federal Parliament. The completion of the general election count early in October showed that Labor had secured 43 seats, Opposition parties 30 and Independent Labor two. The composition of the House when the Government went to the polls was: Labor 49 seats, combined Opposition 25, and Independents one. In the new Senate Labor had 33 seats and the combined Opposition three. A roundup of election figures from all states showed that Labor polled 53 percent of the votes cast for the House of Representatives and the Opposition 44 percent.

J. B. Chifley was unanimously re-elected leader of the Parliamentary Labor Party on October 31 by the party caucus. After the caucus had elected

the members of the Ministry, Chifley designated himself Prime Minister and Treasurer. Other important portfolios were assigned as follows: Minister for External Affairs and Attorney-General, H. V. Evatt; Labor and National Service, E. J. Holloway, and Information and Immigration, A. A. Calwell.

A referendum to decide whether the Constitution should be altered to transfer from the states to the Commonwealth the power to direct social services, marketing control and conditions in industrial employment resulted in the carrying of the first and the rejection of the other two. As a result the Commonwealth Government was given the administration of maternity allowances; widows' pensions; child allowances; unemployment, sickness and hospital benefits; medical and dental services (but not so as to authorize any form of civil conscription); benefits to students, and family allowances. Commenting on the election results Chifley said that the verdict of the people was a clear mandate for the Government to carry on its policies laid down in the past.

**Australians Abroad.** The representatives of Australia played a conspicuous part in the chief official international conferences of the year, including the Peace Conference in Paris, the International Trade Conference in London and the meetings of the United Nations Security Council and General Assembly in New York. Australia's term as a member of the Security Council runs to 1948.

Minister of External Affairs Herbert V. Evatt was an active participant in the deliberations of the Paris Peace Conference until he handed over the leadership of the Australian delegation to John A. Beasley, Resident Minister in London, in order to return to Australia to campaign in the federal election of September 28. On the opening day of the Peace Conference, July 29, Evatt fostered a small-country revolt against the two-thirds vote rule in committee and plenary decisions and demanded a simple majority rule, but the weight of the Big Four opposition to the small-country program was too great to be overcome.

Australia's sponsorship of a good proportion of the amendments put before the conference brought forth the observation from Soviet Vice Foreign Minister Andrei Vishinsky that although 35 percent of the amendments came from Australia that country was farthest removed from Europe (with which the Peace Conference was dealing at the Paris sessions). Beasley then emphatically reminded the delegates that the blood of Australians had been shed in two European wars and observed that Australia did not intend to be intimidated.

At the end of August the Russian delegation repeatedly attacked the Australian delegation throughout two days of debate for having the temerity to suggest changes in the Big Four drafts of the reparation clauses of the treaties. The right of Australia to propose amendments without undergoing attack was defended by American representative Willard Thorp, but the Australians lost their campaign to have their reparations amendment incorporated in the Rumanian and Italian draft treaties.

At the Paris Peace Conference the tone of Evatt's responses to Russian proposals was at variance with that taken by him earlier in the year. Speaking in the Australian Parliament early in March he defended the Soviet Union's foreign policy and advised against giving up the wartime concept of the Soviet Union as a "trusted, peace-loving ally." Evatt's consistent policy, however, was the defense of the rights and privileges of small

nations, a line from which he did not depart wherever the course took him in the direction of temporary alliances.

**Activity in the Security Council.** Australia again took a position opposite to that of the Soviet Bloc in the Security Council session at Lake Success, New York, on September 9, when Australian representative Paul Hasluck supported American skepticism about Ukrainian charges that the Greek Government threatened international peace and security. The Australian called the Ukrainian charges "frivolous" and suggested that they be dismissed from the council agenda. Hasluck was appointed to the Security Council position when Lieut. Col. William R. Hodgson, Australian Ambassador to France, gave up his Security Council post in April to return to Paris because of illness in his family.

At a session of the Security Council in October Hasluck led a revolt of small nations against the veto in a style which was not inferior to Evatt's. He reviewed the use of the veto, saying that it had been invoked 10 times, always by the Soviet Union, and that Soviet Russia had forgotten its representative capacity and its obligation under the Charter to act on behalf of all other members. The debate on the Australian resolution asking the Big Five to refrain from using the veto except in cases dealing with action in respect to "threats to the peace, breaches of the peace and acts of aggression" gave Hasluck the chance to say further that the use of the veto had undermined confidence in the Security Council. A very mild version of the Australian resolution was later adopted by the Political and Security Committee.

**Rejection of Bretton Woods.** A long effort by Prime Minister Chifley and other Cabinet leaders to get Australia into the Bretton Woods Institutions, the International Monetary Fund and the International Bank for Reconstruction and Development, ended in failure, or at least in postponement, in December. The discussion had been protracted. In a Cabinet meeting in the preceding January a minority persistently opposed ratification of the Bretton Woods Agreements on the ground that the International Monetary Fund would rapidly pass under the control of the dollar creditor nations. It might, they argued, be used to deprive the signatories of control of their economies and force them to reduce tariffs solely in the interests of the dollar creditor nations.

In November, after further opposition from a minority, the Cabinet decided to recommend adherence to the Bretton Woods Agreements. Early in December the Parliamentary Labor Party, by a vote of 29 to 23, declined to endorse the recommendation and referred it to the Party's federal conference, the supreme authority on policy. As the conference was not to meet until 1947 the Government could not introduce in the existing Parliamentary session legislation to ratify the Agreements and Australia could not become a member of the Fund or Bank by December 31, 1946, the last date by which she was assured of membership.

Prime Minister Chifley and Minister of External Affairs Evatt had stood steadily for joining the Fund and Bank. In commenting on the Labor Party's refusal, Chifley said that one consequence was that Australia might be excluded from the International Trade Organization to be established in 1947, as some countries, including the United Kingdom, held that membership in the Fund and Bank should be a prerequisite.

**Relations with the United States.** Except for such questions as these and Australian disapproval of

American Pacific island claims, in all of which the rights of small nations were involved, relations between Australia and the United States were cordial in 1946. The signing of the final lend-lease and reciprocal lend-lease settlements between the two countries took place in June. Under the terms of settlement Australia was scheduled to pay \$28,000,000 to the United States for machine tools, equipment and other parts used for peace-time purposes in Australia. Otherwise the slate was wiped clean. Prime Minister Chifley announced that the United States would make available \$7,000,000 of the amount to be paid for United States Government buildings in Australia and for other projects that would improve cultural relations between the two countries.

On July 9 it was announced simultaneously in Canberra and Washington that the two governments had completed arrangements for raising their respective legations to embassies. Mr. Norman Makin, Minister of the Navy, who was made first ambassador from Australia to the United States, took his place as leader of the Australian delegation to the United Nations General Assembly in New York in November. The American Ambassador, Robert L. Butler, presented his credentials to the Governor-General of Australia.

The Australian loan floated in the United States in August was the first foreign financing through regular investment channels in the United States since the end of the war, other than operations for the Canadian Government. The \$28,000,000 offering was put on the market by a syndicate of 61 underwriting houses. The loan, like the one which followed it in December, was for the purpose of gradually refunding at a lower rate of interest the Commonwealth's \$200,000,000 of dollar obligations.

**Empire Relations.** Leading Australians showed an increasing consciousness in 1946 of the need of closer Empire relations, especially in defense. One of the clearest expressions of this feeling was given in January by the Secretary of the Australian Council of Trade Unions, A. E. Monk, who had just returned to Australia from the sessions of the World Trade Union Congress and International Labor Organization in Paris.

Monk said that nothing uncomplimentary to the United States was meant in the observation that the experiences of war served to make Australians more conscious than ever before of how British they were, and more convinced of the contribution a closely integrated Commonwealth could make to the peace and prosperity of the world. He regretted, however, that there was imperfect comprehension in Britain of the strength which might be drawn from the Dominions, and too general an impression in Australia that the Dominions Office did not want to be bothered by unwelcome attentions from the Dominions. In the same month John A. Beasley, Australia's New Resident Minister in London, told reporters that Australia's awareness of the need of improved military, economic, and financial defense within the Empire could be expressed by saying, "When you are out on a limb you feel the need of the main trunk."

At the opening of Parliament in Canberra on November 6 the Governor-General, speaking in behalf of the newly-elected Labor Government, announced that the Government intended that the organization and strength of postwar defense forces should proceed on the basis of recognizing that Australia must make a larger contribution towards the defense of the British Commonwealth, a duty that could best be performed in the Pacific.

Commenting on this part of the Governor-General's speech, *The Times* (London) remarked that it was no secret that in recent years the British response to Australia's proposals for closer integration of British Commonwealth relationships had profoundly disappointed successive governments in Canberra. Little constructive interest had been shown in Australian ideas for cooperation except by New Zealand, a situation which caused former Prime Minister John Curtin to observe in 1944 that if he could not have five brothers he would have to be content with one. As a result Australia and New Zealand worked out bilateral plans for regional cooperation in the Pacific (See YEAR BOOK for 1945, pp. 54-55).

In the summer of 1946 the Commonwealth Government announced that it was in touch with other countries interested in the South Pacific to arrange the first meeting of the South Seas Regional Commission. The Commission was proposed in the "Anzac Pact" between Australia and New Zealand and one of its aims was intended to be the working out of a common policy for the welfare of the native peoples in the South Pacific.

Australian objections to giving up empire preference until concrete tariff concessions should be made by the United States provided difficulties for the Empire trade conference which preceded the international trade conference opened in London on October 15. Australia appeared to demand that the preference system be left intact, in spite of the commitments made by Britain at the Bretton Woods Conference and in the Anglo-American loan negotiations. In this attitude she had the support of New Zealand and South Africa.

**Reconversion.** On the whole, reconversion proceeded more smoothly than had been expected. The unemployment expected in the period failed to materialize and there was no sign of any serious industrial dislocation, although some industries met shortages of construction materials. Shortages of consumer goods were less troublesome than had been anticipated. Figures given by the Prime Minister in his financial statement on July 12 showed that the rate of demobilization had been more rapid than the early estimates had predicted.

Perhaps the greatest single barrier to the rapid expansion of industrial production was the shortage of coal. Requirements for black coal were higher in 1946 than the amount produced and the situation was not improving. Four-fifths of Australia's coal is produced in New South Wales, where industrial disputes have been frequent. In May the country was alarmed by the threat of a strike in this area, which had barely recovered from the disrupting strike of December, 1945, but at the end of the month, after concessions by the Federal Government, the strike was called off.

In July, in a fresh effort to stimulate the production of coal, the Government sponsored a bill providing for joint control of the industry by the Commonwealth and the state of New South Wales. Under the bill, which was passed in August, a control board of five members was given jurisdiction over all phases of coal mining and authorized to develop and operate new fields and to acquire and operate privately-owned mines where such action was deemed necessary.

The Arbitration Court sat for several months of 1946 hearing evidence for and against the general 40-hour working week. On October 30 Judge E. A. Drake-Brockman indicated in the court that the declaration of the broad principle of a 40-hour week was probable, but that it would be subject to special circumstances in certain industries.

**Immigration Policy.** The movement to encourage immigration into Australia gathered momentum slowly, partly because it was not feasible to bring in new residents until the postwar employment adjustments of Australian workers were completed. At the beginning of November announcement was made of the details of the governmental Anglo-Australian scheme under which 200 skilled building trade workers, all single men, would leave Britain for Australia on November 30. Another body of 400 building operatives was scheduled to leave for Australia early in 1947. Both parties were destined for Canberra, where they were to be employed in an extensive plan of building construction.

Although the announced policy of the Australian Government was to give preference to immigrants from Britain, negotiations were begun with a number of other European countries, including The Netherlands and the Scandinavian countries. In view of the shipping situation and other difficulties, however, it seemed doubtful whether Australia could reach its goal of 70,000 immigrants a year by 1948.

One of the most interesting aspects of the campaign to enlist British immigrants was the revival of the "Big Brother Movement" of prewar times. The plan was to send out every year 2,000 boys of 15 to 19—about 500 of them to New South Wales. Every boy who emigrated with the approval of the authorities would have the greater part of his passage paid and would find a "Big Brother" in Australia—a responsible citizen other than his employer. Both the president and chairman of the London committee, which had offices at Australia House, were former governors of Victoria.

**Reduced Taxes.** The announcement of the budget for 1946-47 was deferred until after the September election, but income tax reductions were announced on July 12 by Prime Minister Chifley, who was also serving as Treasurer, in his financial statement. These ranged from nearly 40 percent on the lowest incomes to 7 percent on the highest. At the same time Chifley made public a more liberal scale for old age, invalid, and widows' pensions.

On November 14, after the Labor Government was returned to power, an "anti-inflation" budget was presented. Expenditure for 1946-47 was set at \$1,400,000,000, an amount about \$500,000,000 lower than that of the preceding year but still \$200,000,000 in excess of anticipated revenue. Sales and gasoline taxes were reduced at this time. The budget followed a measure to extend a group of anti-inflationary controls such as wage, price, and rent controls, in order that they should not lapse with the expiration of national security regulations in December.

**Civil Administration in Papua.** A bill for the restoration of civil administration in Papua was presented to the House of Representatives in July by E. J. Ward, Minister for Transport and External Territories. The plans, scheduled to become effective in October, provided for a single temporary administration for Papua and those parts of the mandated territory available for civil control. The indenture system of labor for the natives would be abolished, professional recruiters would be eliminated, and employers would hire labor under a license system. Weekly hours of labor would be reduced from 55 in New Guinea and 50 in Papua to 44 and the minimum age of employment would be sixteen. The plans also provided for a vigorous program of education, but this would not exclude the missionary establishments because of the general reco-

ognition of their valuable service. It was expected that nearly all of the settlements in the area would require rebuilding.

**The People.** Two-thirds of the people live in coastal cities and towns, the largest of which are Sydney, Melbourne, Adelaide, and Brisbane. Sydney and Melbourne between them contain more than one-third of Australia's population of 7,364,841. Elementary education in Australia is free and compulsory, with less than four percent illiteracy among the adult population. The chief religious affiliations, in the order of their numerical strength, are Church of England, Roman Catholic, Presbyterian, Methodist, and Baptist.

**Production.** Australia is the world's largest producer of wool and accounts for approximately 25 percent of world production. Wheat and meat are also important land products. The three are the country's chief exports.

Manufacturing accounted for about 56 percent of the net value of production in the war year 1943-44, although in prewar years primary produce usually exceeded that of the factory. In 1945-46 the country was able to meet much of the domestic requirements in clothing and textiles and to export appreciable amounts as well, although in smaller quantity than before the war. Coal and gold are the most valuable mineral products.

**Foreign Trade.** Australian exports reached the record figure of \$703,000,000 in the financial year 1945-46. This was an increase of more than 50 percent over the last prewar year, 1938-39. An unfavorable balance of trade persisted, however, to a figure greatly in excess of that before the war. Another trend was the shift of trade away from Britain and in the direction of the United States, Canada, India and Pacific countries. In the first half of 1945-46 exports to Britain were 29 percent of all Australian exports as compared with 49 percent before the war, and Australian purchases from the United States were 32 percent of the total as against 15 percent in 1938-39.

ALZADA COMSTOCK.

**AUSTRIA.** A state of central Europe (see *Events* below). Area: 32,432 square miles. Population (1939): 6,650,000. Vienna, the capital, had 1,918,462 inhabitants; Graz, 210,175; Linz, 131,423. See *YEAR BOOKS* for 1938 and 1939 for prewar statistics.

**Education.** Despite shortage of teachers and books and other instructional materials, substantially 100% of the children of elementary school age in the U.S. Zone and the U.S. Vienna area are in School. 80% of the youth who normally attend secondary schools are in school. Adult education is being carried on extensively and all institutions of University rank are in operation, with crowded classrooms and laboratories.

**Production.** Estimated yearly production: pig iron 500,000 tons; crude steel 950,000 tons; brown coal 692,448 tons; salt 84,156 tons; oil reserve (Zisterdorf, Gaisberg, Kreusfeld and Prinzendorf, together with some smaller fields) 1,500,000 metric tons, or more than four times normal domestic consumption. Other natural resources: magnesite (produced in quantity second only to U.S.S.R.), aluminum, antimony, copper, lead, mercury, nickel, tin, zinc, ferrous alloys, coal and coke. Principal sources of energy lie in hydro-electric power, capable of annual production of 26 billion kilowatt hours. Annual production, based upon July production, approximately 4,000,000,000 kw-hr. Exportable surplus approximately 800,000,000 kw-hr. Forests covering 6.5 million acres, or nearly 40% of total land sur-

face, yield a yearly exportable surplus of 2.7 million cubic meters of logs, pit props, pulp wood and finished wood with an annual forest drain of about 4.1 million cubic meters.

Overall industrial capacity is 28% of normal. Textile productivity, approximately 90% of prewar level, with industry operating at between 30 to 40% of existing capacity. Paper and pulp industry operates at 70 to 80% of capacity, steel and iron industry operates at only a fraction of capacity, hampered principally by short supply, and deliveries, of coking coal.

Pre-Anschluss food production was about 75% of Austrian requirements with greatest deficiency in fats and oils, of which 45% was imported. Also imported was 30% of Austria's bread-grain and 10% of meat. Self-sufficient in sugar, potatoes and dairy products, Austria had an exportable surplus in milk products and cheese. Austria's food resources today, both indigenous and imported, are scarcely sufficient to maintain ration level above 1,200 calories per person.

**Foreign Trade.** Foreign trade treaties have been concluded with Czechoslovakia, Poland, Italy and Switzerland, and treaty negotiations with Rumania are in progress. Licenses involving trade have been approved with 18 countries in the following order: Czechoslovakia, 33% of total imports and 29% of total exports; Switzerland, 31% of imports and 28% of exports; Italy, 9% of imports and 8% of exports; Hungary, 4.5% of imports and 4% of exports; United States 3.8% of imports and 7.3% of exports; remaining exports and imports dispersed among other countries in small amounts. Total volume of foreign trade licensed during the first six months of 1946 was 234,730,000 schillings, for the same period in 1937 actual trade amounted to 1,335,250,000 schillings. In terms of official exchange rates (for 1946, the military rate), however, the volume of trade licenses for this period in 1946 was less than 10% of the volume of actual trade during the same period in 1937.

**Finance.** In December 1945, Reichmark circulation was estimated between seven to ten billions (\$700,000,000-\$1,000,000,000). The Conversion Law enacted December 1945 required the exchange of all notes of 10 RM denomination for an equal number of Austrian schillings. The legal exchange rate is generally recognized at 10 Austrian schillings to the U.S. dollar. The black-market value of U.S. dollar declined from 150 schillings per dollar in March 1946 and to between 50 and 60 schillings in July. Foreign Exchange Law enacted in July 1946 gave National Bank of Austria the right to buy the proceeds of exports and other foreign exchange.

**Government.** Following the Anschluss of 12 March 1938, Austria was part of Germany until 1 November 1943. On the latter date, the Soviet Union, the United Kingdom and the United States agreed, in the Moscow Declaration, that Austria, the first free country to fall a victim to Hitlerite aggression, should be liberated from German domination. By March 1945, the European Advisory Commission had outlined arrangements for the four-power occupation of Austria by the Governments of the United States of America, the Union of the Soviet Socialist Republics and the United Kingdom and the Provisional Government of the French Republic, each power being allotted its own zone: U.S.—Oberösterreich (Upper Austria); U.S.S.R.—Niederösterreich (Lower Austria), including Vienna which is under joint occupation of all four powers; U.K.—Steiermark (Styria), Kärnten (Carinthia) and Ost Tyrol (East Tyrol);

France—Tyrol and Voralberg. Agreement in the Economic Advisory Commission on control machinery was reached on July 4, 1945. (A more liberal Control Machinery Agreement was signed in Vienna on June 28, 1946.) A new Austrian Government was organized in 1945, the major political groups of which are The People's Party (Volks-partei) intimately connected with the Roman Catholic hierarchy as the old Christian Socialist group, the Socialist Party (Social Democrats), and the Communists.

**Events.** "Our country is formally liberated," declared Dr. Karl Gruber, Austrian Foreign Minister, to the Chicago Council on Foreign Relations, November 14, 1946, "but it is not yet free. It is occupied by a considerable number of troops and these occupation forces are rather expensive because we have to pay for them, month to month, 30 percent of our budget. . . . They have brought with them different philosophies and different ideas as to how to administer and how to run a country, and so virtually our country is cut into four pieces. . . . We have a difficult food situation. Our people for 1½ years have not had 1,200 calories, which is rather near to a starvation rate. There were many months when we were down to 800 calories. . . . It would be a very great error to think that the European peace can be established as long as there is not a free and independent Austria."

Hopes of freedom from Allied occupation, while not fulfilled during 1946, were brought closer to realization. On January 7 *de jure* recognition was accorded to the Austrian Government by the United States, Britain, France and the U.S.S.R. The regime acknowledged by the occupying Powers was the product of the elections of November 25, 1945, in which the *Volksmartet* or People's Party (VP) won 85 seats in the Assembly, the Social Democrats (SD) 76 and the Communists (KP) 4. The coalition Cabinet named in December, under Leopold Figl (VP) as Chancellor, continued in office throughout 1946, with Dr. Karl Renner (SD) completing the first year of his six-year term as President of the Republic.

**Right and Left.** The balance of political forces was little changed. In the face of continued cooperation between the Catholic, mildly clerical VP and the moderate, revisionist-Marxist SD, extremists of Right and Left made no notable gains. The appearance in Innsbruck in mid-January of the Hapsburg Archdukes Karl Ludwig and Rudolf, brothers of pretender Otto, led to the suppression of the monarchist *Verein Reichsbund der Oesterreicher* and to the arrest of various royalist leaders. The Archdukes were expelled on January 18 by the French authorities in the Tyrol. Another figure of the tragic past, Kurt Schuschnigg, remained in Italy and attributed his "exile" to "one of the occupying Powers"—presumably the U.S.S.R.

Nazi elements were less readily disposed of. Death came on January 29, 1946, to the mysterious Dr. Anton Rintelen, who was designated as Chancellor by the Nazi Putschists of July 1934. Returning war veterans were said to have Nazi sympathies, along with many academicians and students. "Denazification" made slow progress, with Figl protesting in June to the British and American commands over the opposition of Military Government officials to the removal of influential Nazis from public office. Numerous Nazi professors were discharged, particularly from the faculty of Graz, but reactionary students at the University of Vienna and other institutions staged pan-German demonstrations in November and provoked riotous coun-

ter-demonstrations by workers. As in Germany, however, most Nazis were in a mood of lethargy and cynicism.

On the extreme Left the Communists, although active, remained a small minority group. While adhering to the "National Front" in Parliament and Cabinet, KP spokesmen consistently condemned the Western Powers, defended the Soviet Union, asked for "unity" with the SD's and sought to capitalize upon the many grievances of Austrian workers. On September 21 the KP was forced to suspend Karl Heinz as its deputy editor on the staff of *New Austria*, a joint journal of the three parties in Vienna. Heinz, who was aide to Ernst Fischer, leading Communist and chief editorial writer on the paper, was exposed as a contributor to the Nazi press during the Hitler regime. Communist pleas for a general strike were rejected on October 17 by the National Assembly of the General Confederation of Labor. A month later an SD congress rebuffed the KP by choosing a new directorate still headed by Vice-Chancellor Adolf Schaerf who was identified with the anti-Communist party line. Communist agitation at the close of the year for new national elections was without result.

**The Middle Way.** Within the limits imposed by national impoverishment and alien occupation, the VP and SD leaders moved forward along the road to democratic socialism. Both groups favored nationalization of basic industries, with the Catholics, however, sponsoring a less extensive program than the Social Democrats and championing a greater measure of cooperative ownership of plants by workers. Catholic charges that the SD was aiming at "State Capitalism" were met with SD criticism of Figl's party for not being in earnest about socialization.

On June 8 Peter Krauland, Minister of Economic Planning, asserted that the VP "has tried to find a middle way between state and private economy. In the search for a new form of economic organization our leading idea was a cooperative based on the democratic principle of self-determination. The worker must become a co-owner." On July 28, Parliament unanimously passed a nationalization law, despite Soviet objections (see below). The ultimate shape of Austria's new economic order was obscured by her anomalous international position. But there could be no doubt that Catholics and SD's alike were committed to a modified version of a cooperative commonwealth in which private enterprise would be subordinated to the needs of an essentially collectivist economy.

**The Hungry.** Meanwhile, most Austrians were more interested in bread than in social reform. Early in April a complex diplomatic compromise averted impending famine by making it possible for UNRRA to assume responsibility for feeding Austria. UNRRA agents estimated in June that the country could be made self-supporting by the expenditure of \$89,000,000 to replace industrial equipment destroyed or removed. But no such sum was available. Mr. John Wraight, representing LaGuardia, said on June 26: "The Austrian food situation is the worst that I have seen in Europe."

Although employment remained high, while industrial production increased and the currency was relatively stable, Austrian workers faced starvation because of the rise of prices and the fall of wages. Savings were dissipated as consumers supplemented their meagre rations by purchases of food-stuffs on the black market. The situation was made all but desperate by Soviet requisitions and by American refusal to permit the movement of cattle

and other supplies from the American to the Russian zone, lest they be used to feed Soviet troops. On October 12, following an anti-American campaign in the Soviet and KP press, Gen. Mark W. Clark lifted the embargo and announced a new American aid program to the amount of \$35,000,000. Recommendation by Gen. Clark and U.S. Minister John G. Erhardt of an American loan of \$125 to \$150 million further relieved the gloom engendered by the impending cessation of UNRRA at the end of December. But it was by no means certain at the close of the year, despite the announced determination of the Cabinet to effect the increase, that the ration of 1,200 calories could in fact be raised to the 1,550 maintained in the American and British zones of Germany.

**The Dispossessed.** Among the difficulties in the way of a viable Austrian economy were the claims of Jewish property-owners for restitution of holdings seized by the Nazis and the needs of displaced persons unwilling to return to their homelands. The "Aryanization" of Jewish property, the flight or murder of many original owners, and the transfer of many estates to others, some of whom had valid claims, made for slow progress in restitution. Austria's Jewish population increased from 15,000 in the spring to 34,000 by mid-summer because of the influx of new refugees from Poland. In addition, over 500,000 D.P.'s remained in Austrian camps at the end of the year, constituting a drain on Austria's slender resources in spite of the contributions of UNRRA and the occupying Powers to their support. The anti-Soviet and pro-Nazi orientation of many of these refugees, coupled with the fact that they did no work and enjoyed 2,000 calories a day, made all Austrians hope for their early removal or repatriation. At the turn of the year, however, no solution of the problem was in sight.

**The Unredeemed.** In foreign as in domestic affairs, the Government of Austria proposed, but others disposed. Most Austrians entertained hopes of recovering the lost province of the South Tyrol beyond the Brenner Pass, annexed by Italy in 1919 and still inhabited by an almost solidly Austrian population of 200,000 in and around Bozen (Bolzano). Early in 1946 Figl and Gruber urged a plebiscite and offered to safeguard Italian interests in waterpower developments and even to place the area under the military protection of U.N. in the event of a modification of the frontier. On April 30, however, the Council of Foreign Ministers in Paris decided that the South Tyrol should remain Italian. A further decision of June 24 closed the door to even minor border changes. Vienna rejected this settlement, but to no avail.

Over Soviet objections, Dr. Gruber was permitted to state the Austrian case before the Paris Peace Conference, but further discussion effected no change in decisions already reached. Finally the Foreign Minister, making a virtue of necessity, concluded an accord with the Italian Premier in September, accepting the old boundary but providing for ethnic autonomy for the South Tyrolese. This arrangement was denounced by the KP and by Soviet spokesmen, but it seemed likely to stand in view of Anglo-American support of the Italian position. British suggestions of an Austro-Italian customs union, on the other hand, appeared doomed by Austrian doubts and Soviet objections.

**Vienna and Moscow.** Austria's problems were at all points complicated by friction between the Soviet Union and the Western Powers. Each blamed the other for Austria's difficulties and sought to use them to derive advantages for itself. Throughout the year the U.S.S.R. insisted upon treating as

"German assets" (subject to seizure or removal as reparations under the Potsdam Accord) numerous properties in the Soviet zone which the Austrian Government, along with London and Washington, regarded as being outside of this category. In April the Soviet authorities reduced their demands for control of farm lands to feed occupation troops and agreed to pay compensation to Socony-Vacuum and Shell for their holdings in the Zistersdorf oil fields. In May they consented to reduce their occupations costs and to supply UNRRA with oil needed for its Austrian program.

On June 27, however, Col. Gen. L. V. Kurasov signed a decree requiring that all "German assets" in the Soviet zone must be placed forthwith under Russian control. Figl and Clark protested that all properties which were under Austrian ownership before 1938 should be deemed Austrian and not German, despite subsequent forced transfers to Nazi ownership. On July 7 Soviet authorities ordered the expulsion of all *Volksdeutschen* (non-Austrian Germans), estimated to number 54,000, but evictions were halted two days later. The United States renounced all reparations from German assets in western Austria and on July 18 turned over to the Austrian Government the Hermann Goering iron works in Linz. The nationalization law of July was designed in part to forestall Soviet seizures of industrial property. Moscow, however, rejected Anglo-American protest and warned Vienna that it could not nationalize any plants claimed by the Soviet Union under its interpretation of Potsdam. This clash of wills led to the paradoxical situation of Moscow opposing socialization of industries while Washington and London championed it. On August 9 the Allied Council rejected Soviet demands that the nationalization law be held void, whereupon Soviet authorities declared that they would not permit its enforcement in their zone. The controversy was further embittered by arrests and deportations of sundry Austrians refusing to comply with Soviet demands.

**Towards a Peace Treaty.** While these and other issues were still unresolved at year's end, it was clear to all that Austria's fate was more than ever dependent upon agreement among the major Powers. After protracted negotiations in the spring, the four occupying States agreed on June 28 on a new control plan removing zonal restrictions on trade and travel and enlarging somewhat the authority of the Austrian Government. On October 30 Parliament unanimously instructed the Chancellor to work for full independence and the end of the military occupation. The Allied Council agreed on December 3 to reduce occupation costs to 15 percent of the Austrian budget after January 1, 1947. Further agreements were announced ten days later on food distribution and denazification.

The most hopeful development of the year, however, was the decision of the Council of Foreign Ministers in New York on December 9 to meet in Moscow on March 10, 1947 to discuss peace treaties with Austria and Germany. In both countries, Allied administrators had demonstrated their incapacity to perform the tasks of government satisfactorily and to solve the problems of economic reconstruction on the basis of any common program. Since Allied statesmen had no enthusiasm for creating a genuinely international administration for the whole territory of Germany or of Austria, no interest in a U.N. Trusteeship regime for either country, and no desire to effect a permanent partition of the German-speaking lands, the only remaining course was to restore Austrian and German sovereignty and to conclude treaties with the

local regimes. However dangerous such a procedure might prove to be in the case of the Reich, its desirability for Austria would seem to have been demonstrated by the frictions and frustrations of 1948. Further clashes and controversies, however, could safely be predicted before any Austrian treaty would be agreed upon. Austria's fortunes thus depended more than ever on the changing pattern of global relations among the Super-Powers. See GERMANY, GREAT BRITAIN, HUNGARY, ITALY, PARIS PEACE CONFERENCE, UNITED NATIONS, YUGOSLAVIA.

FREDERICK L. SCHUMAN.

**AUTOMOTIVE SAFETY FOUNDATION.** A philanthropic organization supported by annual contributions from more than 200 companies in the motor vehicle, parts and accessory manufacturing, rubber, petroleum, financing, and cement industries. Organized in 1937 and expanded in 1942, the Foundation makes grants of funds and staff services to a wide range of national organizations active in the program for safer and more efficient highway transportation. Chairman: Paul G. Hoffman. President: Pyke Johnson. Vice Presidents: Norman Damon and G. Donald Kennedy. Headquarters: Hill Building, Washington 6, D.C.

**BADMINTON.** The United States invitation tournament, most important national competition in badminton, was restored to the sports calendar last year and the event, held in Buffalo, was dominated by two popular stars. Carl Loveday of Montclair, New Jersey, carried off top prize in the men's singles by defeating Ken Quigley, Cleveland, Ohio, 15-14, 3-15, 15-5; and later paired with Quigley to annex doubles honors. Mrs. H. H. Starrett, Buffalo ace, won the women's singles crown by halting Miss Zoe Smith, Seattle, Washington, 7-11, 11-7, 11-3, and teamed with Miss Barbara Templeton, also of Buffalo, New York, for doubles honors.

Clinton Stephens, New York, New York, and Miss Patsy Roberts, Baltimore, Maryland triumphed in the mixed doubles, and the national veterans' title went to Frank Hinds, New York, New York, and Lee Gustafson, Boston, Massachusetts.

Loveday previously had won the men's singles in the annual Eastern championships and the graceful Mrs. Starrett had triumphed in the women's singles and in the doubles with Miss Templeton. Harry Keating and Bobby Williams, Buffalo, New York, scored in the men's doubles and Quigley and Miss Helen Gibson, New York, New York, took the mixed doubles laurels.

The world professional champion was Stan Cutts of Toronto, Canada.

THOMAS V. HANEY.

**BAHAMAS.** A British West Indian colony comprising 20 inhabited islands and many uninhabited islands and rocks. Land area, 4,404 square miles. Population (estimated) in 1943, 68,846. The chief islands with respect to population are New Providence (29,391) containing the capital, Nassau; Andros Island, Eleuthera, Long Island, Cat Island, Exuma, Abaco and Grand Bahama. The Governor and Commander in Chief (Sir William L. Murphy, April 20, 1945) is assisted by an executive council. There is a legislature consisting of a legislative council and a representative assembly which is elected by voters who must meet a small property qualification.

Nassau is an important tourist center, particular-

ly for Americans, and considerable income is derived from the sale of goods and services to visitors. Sponges, sisal, tomatoes, and fruits are important products. Trade is largely with the United States but ships of British registry predominate.

About 85 percent of the population is colored. The birth rate in 1944 was 37.2 per 1,000 and the death rate was 17.6. Primary education from six to fourteen years of age is compulsory.

A site for a naval base on the island of Mayaguana was leased to the United States in 1940. See BRITISH WEST INDIES.

ALZADA COMSTOCK.

**BAKER ISLAND.** An island in the Pacific (just north of the equator; 176°31'W.) which was discovered by Michael Baker, of New Bedford, Massachusetts, in 1832. It has been formally considered an American possession since 1935 when colonized by students of a Hawaiian boys' school. The island is less than a mile in diameter. By an Executive Order issued May 13, 1936, the island was placed under the jurisdiction of the United States Dept. of the Interior. Its strategic importance lies in its position between Hawaii and Pago Pago, American Samoa, and in its use as a refueling station on the route between Hawaii and New Zealand. Early in 1942 U.S. armed forces were withdrawn but in the fall of 1943 they reoccupied the island without opposition and built a radio and aerological station.

**BANKS AND BANKING.** Banking trends were reversed in important respects during 1946. The rise in commodity prices and expansion in civilian business activity gave rise to a sharp increase in the demand for bank loans, commercial, industrial and consumer. On the other hand, Treasury borrowing ceased as the budget was brought into balance on a cash basis, and bank holdings of Government securities declined substantially for the first time in years as the swollen cash balance left by the Victory loan was used to retire public debt, primarily the short-term issues held by commercial banks. The decline in Government security holdings of the banks brought about a large decrease in total deposits, thus reversing the inflation of bank deposits characteristic of the war years. However, the decline in deposits was entirely accounted for by the very sharp reduction in Government deposits. Other deposits showed some increase for the year, due to the rise in bank loans.

Credit policy also changed in 1946. Whereas, during the war years, its primary objective was to assure adequate reserves to the banks for the purchase of huge amounts of Government securities to finance the nation's participation in the war, the authorities sought in 1946 to exert a limited degree of pressure upon the banks so as to curb the rate of credit expansion to some extent. This was accomplished through the Treasury's debt retirement program. There was growing support for further measures to lift short-term interest rates, but until the end of the year the Secretary of the Treasury and the Chairman of the Board of Governors of the Federal Reserve System refused to end the wartime policy of pegging interest rates on short-term Treasury obligations through unlimited purchases of such securities by the Federal Reserve banks at fixed yields.

**Commercial Banking.** Commercial loans by banks advanced to a record level in 1946. The largest rise occurred in commercial, industrial and agricultural loans, which expanded by \$3,000,000,000 for the reporting member banks alone. Consumer and real estate lending also expanded. Changes in

bank investments, loans and deposits made by reporting member banks of the Federal Reserve System were as follows:

**INVESTMENTS, LOANS, AND DEPOSITS OF REPORTING MEMBER BANKS IN 101 LEADING CITIES**  
(Monthly data are averages of weekly figures. In millions of dollars)

Months of 1948	U.S. Government Obligations	Other Securities	Commercial, Industrial and Agricultural Loans	Loans to Brokers and Dealers in Securities	Other Loans for Purchase or Carrying of Securities	All Other Loans	Demand Deposits Adjusted	Time Deposits
January.....	49,325	3,374	7,272	2,449	2,777	2,869	37,648	9,618
February.....	49,576	3,406	7,368	2,271	2,578	2,925	37,665	9,646

The rapidity of the increase in loans caused some concern among the credit authorities, the Federal Reserve banks issuing a questionnaire late in the year seeking data about loans made by member banks. It was presumed that, if the survey showed considerable use of bank credit for inventory speculation, proposals might be advanced for the grant of additional regulatory powers over bank lending to the Federal Reserve authorities by Congress.

While commercial lending expanded, bank holdings of Government securities declined as the Treasury redeemed the bulk of the certificates of indebtedness maturing during 1946, as well as notes and bonds that became due or were callable. This debt retirement program began March 1 and was largely completed on December 16, when an issue of 1½ percent notes that came due was paid off in cash. The effect of the debt retirement program upon Government deposits and security holdings of commercial banks was summarized by the National City Bank as follows:

(In billions of dollars)			
	Feb. 28, 1946	Dec. 18, 1946	Change
Total public debt.....	\$279.2	\$268.7	-20.5
War Loan account deposits.....	24.4	2.2	-22.2
Bank holdings of government securities.....	92.5	72.8	-19.7

Redemptions of short-term Treasury obligations held by the Federal Reserve banks tended to reduce reserves of member banks. Withdrawals from the banks of Government deposits to pay off maturing obligations held by others than banks also put pressure upon the reserve position of individual banks. As a result, active buying in the market of longer-term Government securities by commercial banks, which occurred in the early part of the year, came to a halt. Instead, commercial banks became sellers of Government securities to the Federal Reserve banks and other purchasers, in order to replenish their reserves. The bulk of outstanding Treasury bills still held by commercial banks were sold to the Federal Reserve banks, as the lowest cost method of securing more reserves. When the Federal Reserve banks in April eliminated the wartime preferential discount rate of ½ of 1 percent on advances secured by Government obligations falling due within one year and the member banks had largely disposed of their Treasury bill holdings, the favored method of replenishing reserves became the sale of certificates of indebtedness to the Federal Reserve banks. This involved a loss of income of ⅓ of 1 percent, a

higher cost of reserve credit that led to a tightening of short-term interest rates charged by banks. While the amount of the rise in lending rates varied

from bank to bank, the extent of the increase was reflected in open market money rates. The rate on prime commercial paper rose from ⅓ of 1 percent at the beginning of the year to 1 percent at its end. The rate on prime 90-day bankers' acceptances advanced from ⅓ to 1½ of 1 percent, and the stock exchange call money rate was lifted from 1 to 1½ percent.

The reduction in bank holdings of Government securities reduced the earning assets of banks, but the effect of this reduction was offset by higher interest rates. Bank profits were adversely affected by increased expenses, particularly salary advances made necessary by advancing living costs. In the first half of 1946, earnings of member banks from all sources aggregated \$1,175,000,000, an increase of \$159,000,000 over the same period in 1945. Expenses rose to \$694,000,000, an increase of \$93,000,000. After recoveries, charge-offs and taxes, net profits were \$429,000,000, an increase of \$38,000,000. Cash dividends declared by member banks in the first six months totaled \$124,000,000, an increase of \$8,000,000 for the year.

**Federal Reserve Policy.** The Federal Reserve System placed efforts to combat inflation at the forefront of its policy objectives, rather than the facilitation of Government financing which dominated the System's activities during the war. However, anti-inflation measures were seriously hampered by the policy of pegging the Treasury bill rate at ⅓ of 1 percent and the certificate of indebtedness rate at ⅓ of 1 percent, which was unchanged during the year.

The most significant positive action taken by the Federal Reserve System during the year was the elimination of the wartime preferential discount rate of ½ of 1 percent on advances to member banks secured by Government obligations due or callable in not more than one year. In announcing this action on April 24, the Board of Governors stated:

"The Board has approved discontinuance of the preferential rate because it has served the purpose of facilitating the war-financing program for which it was adopted in 1942. The Board does not favor a higher level of interest rates on U.S. securities than the Government is now paying. Discontinuance of the special rate will not involve any increase in the cost to the Government of carrying the public debt.

"The preferential rate encourages member banks to borrow at Federal Reserve Banks in order to hold or to purchase additional Government securities, or to lend to others at low rates for the purpose of holding or purchasing government securities. While such encouragement was justified early in

the war to induce the banks to utilize their reserves more fully in financing huge war expenditures, it has subsequently made for speculation in Government securities and has resulted in unnecessary expansion of the money supply through monetization of the public debt. The Government's program no longer calls for expansion of bank credit to help finance huge war expenditures. Instead, it calls for action that will stop additions to and bring about reductions in the country's monetary supply in order to reduce inflationary pressures. Discontinuance of the preferential rate, therefore, signifies an appropriate adjustment from wartime to postwar conditions in accordance with the Government's program of economic stabilization."

During the early months of the year the Federal Reserve authorities were preoccupied with the tendency of commercial banks to buy long-term Government obligations in the market in order to increase their earnings. This further monetization of the national debt was considered a serious problem, leading to the presentation to Congress of proposals for drastic new regulatory powers for the Federal Reserve System. In June, the Board of Governors of the Federal Reserve System proposed to Congress amendments to the Federal Reserve Act that would:

1. Authorize the Board of Governors to specify the maximum amount of long-term marketable securities, public and private, that any commercial bank may hold against its demand deposits.

2. Authorize the Board of Governors to require commercial banks to hold a specified percentage of treasury bills and certificates of indebtedness as secondary reserves against net demand deposits, over and above their cash reserve requirements.

3. Authorize the Board of Governors to raise member bank reserve requirements against net demand deposits above the maximum ratios provided in the present law. It suggested also that all commercial banks be subject to the same reserve requirements, so that non-member banks would have to conform to those imposed upon member banks.

4. Grant the Board of Governors permanent control over consumer credit terms. Supporting this latter recommendation, the report stated:

"From time to time the expansion and subsequent contraction of consumer credit have gone so far as to accentuate the upswings and downswings of the business cycle. There is no way of preventing such excessive expansion and contraction except governmental regulation of the terms on which consumer credit shall be made available, such as the down payment required on instalment sales or financing and the length of time permissible for instalment contracts."

Pressure for the enactment of these proposals relaxed, however, when the Treasury's debt retirement policy checked commercial bank purchases of long-term Government securities and imposed a restraining influence upon bank credit expansion. The results of the November elections also clouded the outlook for legislation to grant additional powers to the Board of Governors of the Federal Reserve System.

The stand of Chairman Marriner S. Eccles of the Board of Governors of the Federal Reserve System as regards credit policy was summarized in an address late in the year. Mr. Eccles opposed unpegging the certificate of indebtedness rate on the ground that this step would increase the cost of carrying the national debt and add to bank earnings, which he already considered adequate. "If short-term rates were permitted to rise sharply," Mr. Eccles stated further, "there would also be

pressure to drive long-term rates up. This would jeopardize the savings bond sales program and cause wholesale redemptions." On the other hand, President Allan Sproul of the Federal Reserve Bank of New York, in an address made in December, favored an increase in the rate at which certificates of indebtedness were pegged to 1 percent or 1½ percent as a further mild measure, following the Treasury's debt retirement program, for discouraging credit expansion. Ending the certainty as to the yields at which short-term Government securities would be pegged by the Reserve banks, Mr. Sproul argued, would restore a measure of control over the volume of credit to the Federal Reserve System, which is helpless to check credit expansion so long as member banks can secure more reserves at will by selling certificates of indebtedness to the Federal Reserve banks at the pegged rate. "There is a vast difference," Mr. Sproul argued, "between supporting a market at your own discretion, at rates which can move up or down, and supporting a market at fixed rates which you have announced in advance your determination to maintain." Furthermore, Mr. Sproul contended, the initiative in setting the cost of Reserve bank credit should be restored to the Federal Reserve System.

The Federal Reserve authorities took two other steps to tighten qualitative control over credit expansion, while refusing to use the traditional weapon of higher interest rates to check inflationary tendencies in the economy. On January 21, the Board of Governors of the Federal Reserve System raised margin requirements to 100 percent on new extensions of credit on securities, thus cutting off the use of bank credit or loans by brokers to finance security buying. Even after the stock market declined sharply in September, the Board of Governors refused to relax this 100 percent margin requirement. On December 1, however, Regulation T applicable to brokers' loans and Regulation U to bank loans on securities were modified to permit the purchase on a 50 percent margin of stocks being offered to their shareholders by corporations through the issuance of rights.

The Board of Governors of the Federal Reserve System also resisted pressure for modification or elimination of its Regulation W, applicable to consumer credit. On December 1, Regulation W was revised so as to restrict its application to instalment loans and instalment credit used for the purchase of major durable goods. Charge accounts and single payment loans were eliminated. At the same time,

**COMMERCIAL BANK HOLDINGS OF GOVERNMENT SECURITIES**

(Cumulative weekly from February 27, 1946)

Congress was urged by the Board of Governors to enact legislation providing for permanent control over instalment credit terms by the Board of Governors of the Federal Reserve System. Regulation W now rests upon an Executive Order of the President which is revocable by the President or by action of Congress.

**The Money Supply.** Money in circulation reached a record level late in the year, somewhat above the wartime peak, in response to rising commodity prices and the larger volume of civilian employment. Demand deposits of individuals also increased moderately during the year, although total deposits declined because the Treasury used its balances to pay off maturing Government securities held outside the banks and the expansion of commercial loans gave rise to new deposits. The turnover of demand deposits of banks in New York City declined in the later months of the year with the reduced activity in the security markets, but turnover of deposits of banks outside of New York City was well maintained with business activity.

DEPOSITS IN BANKS—ALL ACTIVE BANKS

A pioneer study of the ownership of liquid assets was carried out by the Bureau of Agricultural Economics at the request of the Board of Governors of the Federal Reserve System. This survey showed that ownership of bank deposits and Government securities by individuals was not as widely distributed as had been generally supposed, despite the wartime tendency towards a wider distribution of national income. The survey, based upon a limited sample, indicated that the top 10 percent of the 46,000,000 spending units of the nation owned 60 percent of all liquid assets, while the bottom 40

DISTRIBUTION OF PERSONAL LIQUID ASSET HOLDINGS, END OF 1945

pending Units by Percentage Classes		Percentage of All Assets Held	Average Amount of Holdings (In Dollars)
Top	10 per cent . . . . .	60	10,500
Next	20 per cent . . . . .	27	2,350
Next	30 per cent . . . . .	12	700
Bottom	40 per cent . . . . .	1	40
Total	. . . . .	100	1,750

percent of the spending units owned 1 percent. A spending unit consists of persons living in the same dwelling and belonging to the same family who pool their income. These findings are summarized in the accompanying table.

JULES I. BOGEN.

**BAPTIST CONVENTION OF AMERICA, National.** The Sixty-sixth Session of the National Baptist Convention of America convened in Columbia, South Carolina, September 4-8, 1946 with the Zion Baptist Church, Rev. J. P. Reeder, D.D., as entertaining church and pastor. The parent body's sessions were held in the City Auditorium of Columbia, the Woman's Auxiliary convened in the Zion Baptist Church. Meeting jointly were other Auxiliaries, such as the Junior Women's Convention, the Baptist Brotherhood and the Youth's Convention.

The key note of the Convention was "Lifting Up The Christ." The major objectives were: Foreign Missions; Home Missions; Religious Education; and Temperance. The seven Boards which do the work of the Convention during its interim made their reports through their chairmen and corresponding secretaries. The two representatives of the Convention who were authorized to do the work on foreign fields and who went to Africa and the West Indies made their reports, submitted their findings and recommendations of what they found, saw and would like to have done under the authority of the parent body.

Three new state bodies were added to the roll for the year. 700 District and County Conventions were enrolled through the week through representatives and messengers. The statistician reported an increase in membership of 152,201, bringing the total numerical strength of this Convention up to 2,318,022 members. A nation-wide Evangelical Campaign was endorsed as one of the objectives for the new year. The Foreign Mission Board's guarantee to raise \$60,000.00 for the erection of a hospital, a Baptist school and four dormitories for missionaries in Africa was concurred in, and the campaign is to be launched early in 1947.

Three new Colleges were added to the Educational Board's objectives, bringing the total schools now assisted financially by the Convention up to eight. They are the Lynchburg Theological Seminary, Lynchburg, Virginia, Georgia Baptist College, Macon, Georgia, Florida Normal & Industrial College, St. Augustine, Florida, Conroe College, Conroe, Texas, Union Theological Seminary, New Orleans, Louisiana, Guadalupe College, Seguin, Texas, Mary Allen College, Crockett, Texas and Coleman College, Shreveport, Louisiana.

The Convention re-affirmed its action of last year in favor of a Prohibition Law, a Permanent F.E.C.P., the Repeal of the Poll Tax, the passage of the Anti-Lynch Bill and a permanent movement for the establishment of peace throughout the world, urging the United States representatives at the Peace Conference to pray for divine guidance in their deliberations.

The amount in cash raised at the Convention was \$59,269.00. The amount of money raised during the year by the various Boards and Departments of the parent body was \$563,817.49. The appropriations made by the Convention were \$20,000.00 for Foreign Missions, \$8,000.00 for Home Missions, \$8,000.00 for Education, \$1,000.00 each for promotion work of the Woman's Auxiliary Convention, Junior Women, Benevolent Department, Home Missions, Foreign Missions and Education.

The following are the major officers elected for the ensuing conventional year: Rev. G. L. Prince, President, Galveston, Texas; Rev. G. G. Daniels, Secretary, Georgetown, S.C.; Rev. A. A. Lucas, Treasurer, Houston, Texas; Rev. A. L. Roach, Field Secretary, Cleveland, Ohio; Rev. Wm. Grimbale, Corresponding Secretary, Alexandria, La.; Rev. L. B. Tolson, Houston, Texas, Statistician; Rev. M. C. Allen, Auditor, Baltimore, Md.

The 1947 session of the Convention will be held in Little Rock, Arkansas, September 10-14. Rev. C. D. Pettaway entertaining pastor, and First Vice President. The National Baptist Publishing Board, with Henry A. Boyd, Secretary, 523 2nd Avenue North, Nashville, Tennessee, is the accepted headquarters of the Convention.

**BARBADOS.** An island colony of the British West Indies. Area, 166 square miles. Population (estimated) January 1, 1945, 203,528. Capital, Bridgetown. The Governor (Sir Hilary Blood, 1946) is assisted by an executive council and an executive committee. There is also a legislative council of ten appointed members and a house of assembly of twenty-four members elected every two years by the people.

A good proportion of the island is cultivated, with sugar as the major crop. Sugar, molasses, rum, tamarinds, cotton, and margarine were the important exports in 1944. Imports were chiefly cotton textiles, fertilizers, wood products, iron and steel products, and articles of food and clothing.

**BASEBALL.** The year 1946 marked the dawn of a new golden era in sports and our national pastime, first to get away from the barrier, was the first to reap the benefits. Although many returning veterans found difficulty rounding into condition and the caliber of play was far below the prewar standard it mattered little to the fans. With money plentiful and the desire of an athletic-minded nation to enjoy itself after the long period of restraint, the turnstiles kept spinning through the long campaign.

The year included such unprecedented events as a tie for the National League pennant, bringing about the first playoff in the game's history; an attempt to unionize players that resulted in a period of labor strife; an international "incident" caused when Mexico's fabulously-rich Pasquel brothers lured some American stars over the Rio Grande with fat contracts, and one of the biggest upsets in world series history when the St. Louis Cardinals tripped Boston's highly-regarded Red Sox in a seven-game struggle.

However, the real record-making was done by the fans themselves and even promoters and club owners, who had known the lush days of the "Roaring Twenties," hardly were prepared for the great outpouring at the gate. During the past few years only the more successful clubs in New York, Chicago and Detroit had topped the million mark in home attendance, but in 1946 no fewer than ten clubs rocketed over this figure while one passed the incredible two-million mark. This occurred at the Yankee Stadium where Larry MacPhail, by refurbishing the "House That Ruth Built" and installing brilliant lighting for night ball, enticed 2,309,029 persons to see the Yankees play their 77-game home schedule. However, the New York nine itself didn't have the glitter to match its surroundings and the once-great Yankees, staggering along under three different managers during the season, fell out of pennant contention before mid-season and finished a weak third behind Boston and Detroit.

In the American League, the Red Sox, Tigers, Indians and Senators also drew more than a million fans at home. Those in the National to exceed that figure were the Dodgers, with 1,796,155; the Cubs, Cardinals, Phillies and Giants, the last-named turning the trick with a club that finished last. The two circuits combined attracted 18,612,704, more than seven million over baseball's best previous year.

Add to this a jump in the minor leagues from 18,000,000 in 1945 to 31,000,000 last year and it is apparent that baseball really found a rich plum.

The major leagues provided a pair of extraordinary flag races. Flashing a galaxy of stars, the long overdue Boston Red Sox made a runaway of the American League pennant drive. By July the battering Sox, led by the power hitting of Ted Williams, Dom DiMaggio, Johnny Pesky and Rudy York, had shaken off all pursuers, including the highly-favored Yankees, and from there they went on to win in a breeze and give Boston its first flag in twenty-eight years.

In the National League, it was a different story as the well-backed St. Louis Cardinals just couldn't get away from the amazing Dodgers, who had been given little consideration in the Spring. The two teams fought neck and neck through the campaign and as the sun set on the final Sunday of the season, the two were deadlocked for first place. This brought about a unique two-out-of-three play-off and victory finally went to Eddie Dyer's Redbirds. They blasted the Dodgers hopes in two straight contests, the first in St. Louis and the second in Brooklyn.

It was then the baseball world acclaimed Dyer, a pennant winner in his freshman year as a major league pilot. But fandom began to feel sorry for Dyer and experts gave the Cards little chance against the steady pitching and superior attack of the Red Sox.

Fighting hard behind their great southpaw, Harry (The Cat) Brecheen, the Redbirds not only silenced the big guns of Williams, but fought the other Sox right down to the wire to win the seventh and deciding game by 4-3. And baseball saved its biggest thrill for the last game of the year as Enos Slaughter, taking advantage of a momentary lapse on Boston's part, raced all the way from first base with the winning run after Harry Walker's short double. The triumph did much to soothe the hurt feelings of National League fans, who had practically conceded the world's championship to the American League as early as July when the junior circuit's team embarrassed the National League's representatives by a record 12-0 score in the All-Star contest.

The distribution of individual honors for the year proved difficult, but one player stood out above all others and he was Stan Musial, star first baseman of the Cardinals, whose fielding and heavy hitting inspired the Redbirds through the pennant race and the long series. The converted outfielder not only won the National League batting crown with an average of .365, but was voted the most valuable player in the circuit. Then there was Brecheen, star in the pinches all season, who won three world series games to become the first pitcher to do so since Stan Coveleskie achieved the feat in 1920.

Williams, despite a letdown in the series, in which he got only five hits in twenty-five official times at bat, and his failure to capture the American League hitting title, received the most valuable player award in his circuit. Mickey Vernon of the Washington Senators paced the American league in batting with a .353 percentage.

Hank Greenberg of Detroit, playing his first full season since 1940, was the outstanding slugger of the majors with 44 home runs, while the foremost pitcher was Bob Feller of the Cleveland Indians. In striking out 348 batters, Bob erased the listed record of 343, set by Rube Waddell back in 1904 and one of the oldest standards in baseball annals. Dave Ferriss of the Red Sox led in games won with a mark of 25 and 6.

Off the field, numerous unforeseen things developed. Early in the Spring came "raids" on the ranks of the majors by the Mexican League, financed by the wealthy Pasquel brothers. Although players were threatened with a five-year ban from American baseball if they jumped to Mexico, more than a score yielded, including such stars as Max Lanier and Lou Klein of the Cardinals and Mickey Owen of the Dodgers. Owen returned to this country later but found himself a star without a team when Commissioner Happy Chandler stuck fast to his five-year ban of the "wayward" players.

Following this came the attempted unionization of players, which led to a revolutionary step among club owners who invited player representatives to draw up better contracts, which included pension plans.

Further news-making came in the turnover of managers, the Yankees playing under three during the campaign. The New Yorkers started with Joe McCarthy, who retired because of ill health; then tried Bill Dickey and finally Johnny Neun, who later moved on to become new pilot of the Cincinnati Reds, replacing the veteran Will McKechnie. And as 1946 drew to a close, Bucky Harris was chosen to guide the Yanks back onto the winning trail and he immediately began rebuilding for the 1947 campaign.

Other skippers to go overboard were Luke Sewell of the St. Louis Browns, now piloted by Muddy Ruel; Jimmy Dykes of the Chicago White Sox, who was succeeded by Ted Lyons, and Frankie Frisch of the Pittsburgh Pirates, who was replaced by Billy Herman.

The minor leagues, in addition to shattering records at the gate, added a page to diamond history when Jackie Robinson, first Negro ever to play in organized baseball, paced Montreal's Royals to the International League championship, triumphs in the Governors' Cup playoffs and the little world series against Louisville, which had won the American Association flag. Robinson, in his first season, carried off the International circuit batting crown with the average of .349.

Dallas triumphed in the Texas League and the Dixie series, Atlanta took Southern Association laurels and San Francisco took the Pacific Coast title.

THOMAS V. HANEY.

**BASKETBALL.** Our most popular Winter sport continued its swing upward last year, and once again Madison Square Garden, under the guiding hand of the genial Ned Irish, captured the national spotlight. Attracted by 21 doubleheaders, bringing together the outstanding college quintets of the country, more than 600,000 fans were drawn to the big New York arena and only once did a twin bill play to fewer than 18,000 persons.

Oklahoma's Aggies, with seven-foot Bob Kurland, the big gun in a fast-moving attack, kept its top perch in intercollegiate competition, compiling a record of 31 victories against only two losses for the campaign. The Cowboys successfully defended their National Collegiate Athletic Association crown by conquering North Carolina, 43-40, before 18,479 persons at the Garden, Kurland netting 23 points in that important struggle. The marksmanship of Kurland, generally acclaimed as the player of the year, and the all-around work of Weldon Kern proved too much for the Tarheels, who rallied strongly near the close of the battle.

Third place in the N.C.A.A. finals went to Ohio State, which beat California, 63-45. The Aggies had reached the title playoffs by routing California, 52-35, in the Western Division final as Kur-

land made 29 markers, while North Carolina earned the right to represent the East with a 60-57 triumph over Ohio State in an overtime contest.

Another highlight of the year was the Garden's annual intercollegiate invitation tournament, Kentucky being returned the victor when it topped favored Rhode Island State, 46-45, on Ralph Beard's last-minute foul shot. Third place in the colorful event went to West Virginia when the Mountaineers halted Muhlenberg, 65-40.

Added to the 1945-46 college card was a game between the East and West All-Stars, which drew 18,157 fans to the Garden. The underdog Eastern five upset the West, 60-59, in a real thriller, proceeds of which went to the Tribune Fresh Air Fund. A preliminary, bringing together Cliffside Park High of New Jersey and Southern High of Baltimore, Maryland, two of the nation's leading schoolboy quintets, ended with Cliffside triumphant by 43-20.

For the first time in several seasons, winners of the N.C.A.A. and invitation tourneys were unable to get together for the annual Red Cross benefit bill, and last-minute arrangements were made to bring the powerful Phillips 66 Oilers, four-time national A.A.U. champions from Bartlesville, Oklahoma, East to meet the New York A.C. The Winged Foot five, metropolitan A.A.U. ruler, was within 25 seconds of recording the year's biggest upset when the speedy Oilers rallied to tie the score at 63-63, and then draw away to win, 69-64.

In a preliminary, the United States Navy Armed Guard Center, Third Naval District champion, turned back the Tilton General Hospital team, 67-55, to hang up its twenty-eighth triumph in 30 starts. The twin bill netted more than \$12,000 for the Red Cross.

One of the season's major surprises came in the annual meeting of Notre Dame and New York University, the Violet standing off a spirited closing bid by the Fighting Irish to gain a 62-58 decision.

The Pacific Coast Conference resumed its title playoffs—dropped during the war—and California, Southern Division champion, captured the title for the seventh time by toppling Nevada, Northern ruler. Nevada, which had won group honors for the first time in 23 years, bowed to the Bears in the third and deciding contest, 55-36. Kentucky won Southeastern Conference laurels for the third straight year and eighth time, while Duke dethroned North Carolina in the Southern Conference. Dartmouth annexed its eighth Eastern League crown in nine seasons; Ohio State won in the Big Ten, Kansas State in the Big Six and Wyoming in the Big Seven.

The Phillips Oilers again swept through the national A.A.U. tournament, with Nashville repeating in the women's competition. Canadian senior honors went to the Victoria Dominos.

In professional basketball, the Baltimore Bullets turned back the Philadelphia Sphas to oust the Sphas as American League kings, while the Rochester Royals triumphed in the National League. Top prize in the world pro championship tourney was captured by the Fort Wayne Zollners for the third consecutive season. A new tournament scoring mark was set by the Rens, New York Negro five, when they defeated Toledo, 82-39, the previous mark of 80 points having been established by the Dayton Acmes the year before.

THOMAS V. HANEY.

**BASUTOLAND.** A British native territory in southern Africa. Area, 11,716 square miles. Population

(1936 census), 562,411, including 559,377 natives. Capital, Maseru. The territory is administered by a resident commissioner under the direction of the High Commissioner for the British High Commission Territories in South Africa.

The principal crops are wheat, maize, sorghum, barley, oats, beans, peas and other vegetables. Sheep raising is an important enterprise and wool is by far the largest export. Cattle, wheat, and sorghum are also exported. Imports, consisting largely of agricultural and domestic implements and supplies, were £1,033,328 in 1942 while exports were only £459,509. Resident Commissioner, C. N. A. Clarke, appointed 1942.

**BATTLE MONUMENTS COMMISSION, American.** A Commission created by Congress in 1923 to erect, or control the erection of, monuments to the American forces in Europe during World War I, and to maintain the American national cemeteries and memorials in Europe. Chairman: Gen. John J. Pershing.

**BECHUANALAND.** A British protectorate in southern Africa. Area, 275,000 square miles. Population (1936 census), 265,756, including 260,064 natives. The territory is administered by a resident commissioner, acting under the High Commissioner for the British High Commission Territories in South Africa. The headquarters of the administration is Mafeking, Cape Province. The native tribes are ruled by their chiefs as before the territory was incorporated in the British sphere, but now under the protection of the King. Much of the country is pastoral and cattle are raised in large numbers. Resident Commissioner, A. D. F. Thompson.

**BELGIAN CONGO.** Belgium's only colony, located in central Africa and embracing a large part of the basin of the Congo River. Area, 902,082 sq. mi. Capital, Léopoldville.

**Characteristics of the Population.** The native population on Jan. 1, 1945, was 10,389,155. Whites numbered 36,080, of which two-thirds were Belgians. Most of the natives are Bantu and Sudan Negroes, with a few Nilotic tribes in the northeast and some Pygmies scattered in the interior.

The Belgians point with pride to the number of schools available for the natives. Most of these schools are provided by Christian missions, though many are subsidized by the government. In 1945 there were 5,903 subsidized primary schools (311,388 pupils) and 56 subsidized secondary schools (3,872 pupils). Not subsidized were 199 primary schools (46,827 pupils), 8,994 rural schools (246,424 pupils), and 24 professional schools (1,343 pupils). In general, instruction in technical fields is emphasized rather than in social or broadly cultural studies.

The great mass of the natives is still pagan. The work of the Christian missions is carried on by some 4,000 missionaries (three-fourths of whom are Roman Catholics), without whose activities the government would have been compelled to engage far more widely in educational and welfare work than is now the case. Compared with adjacent colonies, the Belgian Congo has in recent years enjoyed a reputation as one of the most progressive in health and sanitary measures. The Belgians proceed on the theory that a healthy native population is an economically efficient one.

**Government.** The administration is under the general supervision of the Belgian Minister of Colonies, normally an appointee of the King, and is assisted by a Colonial Council. At the head of the actual administration is a Governor-General, assisted by a

Vice-Governor, state inspectors, and six provincial governors. The provinces are in turn divided into districts and these are subdivided into administrative territories. The frame of government is thus centralized, hierarchical and with little place for native participation.

The Congo is saddled with a large debt, though not unwieldy in view of the Colony's expanding economy. In 1939 the figures were: consolidated debt, 3,992,980,029 francs and floating debt, 480,004,400 francs, in addition to 1,368,957,250 francs of guaranteed capital. In 1945 government receipts were estimated at 1,765,683,000 francs and expenditures were 1,601,405,000 francs.

**Events, 1946.** Belgian colonial administration has never been distinguished by any real effort to prepare the native population for self-government. It was therefore of some interest that in November 1945 an executive order was issued creating an Advisory Council for the whole colony, and one for each province. Their members were to be appointed by the Governor-General, and they were to have only consultative authority. The composition of the councils was to be made up from four specified categories of officials and non-official persons. Though African representatives were specifically provided for, only two or three of these would be natives, the others being missionaries or retired officials. These Councils came into operation early in 1946.

In an address on July 8, M. Robert Godding, Minister of Colonies, discussed the problem of increasing Belgian migration to the Congo. He pointed out how useful the 25,000 Belgians there had been during the recent war, and voiced the hope that this number would increase so that in the event of another invasion of Belgium the Congo could serve as a sort of national redoubt. He called attention to the fact that the death rate of whites in the Congo had dropped from 22 per 1,000 in 1920 to 7 per 1,000 in 1940. He visualized many opportunities for European settlers without in any way interfering with the development of native industries.

The annual report of the Union Minière du Haut Katanga, presented in Brussels on July 8, showed that copper production had declined while prices had risen. In 1945 most of the 160,200 metric tons produced was purchased by the United States. Shipments during 1946, however, were going to Belgium and other European countries. England withdrew from the market after having taken over 700,000 tons since 1940. As for radium, during the war sales varied from 80 to 150 grams a year, but were now decreasing. Instead, uranium ore had become an important product and was being used in experiments to produce "canned power." From other sources it was learned that an experimental pilot plant for this purpose had been built. During the war most of the Congo's uranium production went to the United States for use in the fabrication of atomic bombs.

On January 13 the *African Clipper* of Pan American Airways left New York on its flight inaugurating fortnightly service to Léopoldville. Following a course via Newfoundland, Eire, Lisbon and Monrovia, this route put the Belgian Congo within forty-one hours of New York City. Later in the year Air France inaugurated a service from Paris to Léopoldville. Various feeder lines were being organized to provide local services within the Congo.

During January the Belgian Congo ambulance unit returned home after having served in Ethiopia, Madagascar, Ceylon and India.

**The Economy of the Country.** The Belgian Congo is, industrially speaking, one of the most advanced colonies in Black Africa. The country is rich in mineral resources, fertile soil and potential water power (only a fraction of the colony's potential water power—second largest in the world—is now utilized). The natives have shown themselves readily adaptable to work in mines, factories and offices. The Belgian régime has also been very friendly to the introduction of outside capital. As a result the production of the Congo's plantations, mines and textile mills has been highly profitable.

Production figures for 1944 are as follows: rubber, 11,000 metric tons; peanuts, 50,000 tons; cotton, 30,000 tons; palm oil, 120,000 tons; copper, 165,484 tons; gold, 11,328 kilograms; diamonds, 7,144,552 carats (world's leading producer by weight); tin, 23,790 tons; as well as important amounts of manganese, zinc and iron.

The colony's foreign trade, much of which passes through the port of Matadi on the lower Congo, in 1944 amounted to: exports, 4,620,548,000 francs; imports, 2,948,922,000 francs. The United States and the United Kingdom each took 1,500,000,000 francs worth of Congo products. The United States also provided imports worth 1,194,995,000 francs. The return of peace was, however, expected to alter the direction of the Congo's trade relations.

The Congo River and its larger tributaries are navigable for varying distances. The Congo itself is broken at several points by cataracts, around which railroads have been built. Navigable rivers total more than 7,500 miles, railways 3,106 miles, and roads 56,000 miles. Before the war the Congo was served by several international airways and possessed an extensive internal network operated by the Sabena Company.

**Ruanda-Urundi, Territory of.** These two districts, formerly part of German East Africa, were assigned to Belgium as a B Mandate after World War I. The Territory has an area of 20,152 square miles and an estimated population of 3,767,002—one of the most dense in Black Africa. The capital is Usumbura. In 1925 the Territory was joined administratively with the Belgian Congo and placed under the direction of a vice-governor. In 1945 there were 3,609 schools with 224,314 pupils. Cattle-raising is important. The chief exports are cotton, coffee, hides and tin. In 1944 the budget was balanced at around 88,000,000 francs.

**Events, 1946.** The Belgian government offered to transfer the mandated territory of Ruanda-Urundi to the United Nations in order to make it into a trusteeship area.

ROBERT GALE WOOLBERT.

**BELGIUM.** A kingdom of Western Europe. Capital, Brussels. King, Leopold III, who was crowned Feb. 23, 1934; he was a German prisoner-of-war from May 27, 1940 to May 8, 1945 (For his present status, see below under *Events*). Regent, Prince Charles, Leopold's younger brother, who took the oath on Sept. 21, 1944.

**Area and Population.** The area of Belgium, including the districts of Eupen and Malmédy, is 11,775 square miles. The estimated population on Jan. 1, 1945, was 8,334,276. The people are of two distinct races, the Flemings, of Germanic stock and the Walloons, of Celtic or Alpine racial origin. French and Dutch are official languages.

**Other Population Statistics.** Estimated population of the chief cities on January 1, 1945: Brussels and suburbs, 898,352; Antwerp, 254,057; Ghent, 159,321; Liège, 152,507. Births in 1944 numbered

124,075 against 105,749 in 1942. There were 124,881 deaths in 1944 against 117,291 in 1942. In 1944 marriages totaled 45,352 and divorces 3,398.

**Education and Religion.** During 1942-43 there were 886,288 pupils in 8,574 elementary schools, 81,192 students in 267 secondary schools, and 14,315 students in three universities at Louvain, Ghent and Liège. Roman Catholics form a large majority of the inhabitants who profess a religious faith. There is full religious liberty.

**Government.** The Constitution of 1831, as amended in 1921, vested executive power in the King, acting through a Ministry responsible to Parliament. See *YEAR BOOK* for 1940, for the governmental system existing at the time of the German invasion of May 10, 1940. On July 18, 1945, a law was passed to amend the Constitution to permit the establishment of a Regency with Prince Charles as Regent.

**Events, 1946.** Belgium, in 1946, performed the remarkable feat of prospering economically while teetering continually along the edge of a political precipice.

The country's political life continued under the shadow of the unsolved "King Question." Although Leopold III made no further attempt to return from his involuntary exile in Switzerland, his stubbornly maintained claim to the throne kept the nation in suspense and perpetuated the cleavage between Left and Right.

Immediately after the dissolution of the Belgian Parliament on January 9, the King made a strong bid for a popular plebiscite on the question of his return to the throne. In an interview with C. L. Sulzberger of the *New York Times*, on January 20, he declared: "I am by right the King of the country and I shall abdicate only if I know that this is the wish of the majority of the people. So far there have been no indications that such is the wish of the majority. . . . I hope that the new Parliament that will be elected will accurately represent the people and that it will then pass a law permitting a national referendum on the question of my return; and furthermore, I hope no political group will be able to block such a referendum, which is essential."

On the same day, however, an exchange of letters between Leopold and Prime Minister Achille van Acker was made public in Brussels which showed that the Government had politely but firmly turned down the King's request for a plebiscite.

But the Government could not prevent the matter from becoming an election issue of first-rate importance. The large, conservative Christian Social party made the King's demand for a referendum its own and centered a vigorous election campaign upon it. All the other parties were opposed to it, with varying degrees of firmness and passion.

The general election was held on February 17, and resulted in the expected advance of both the extreme Right and Left, at the expense of the center. The chief victor was the Christian Social party, which captured 92 seats in the Chamber, out of a total of 202. The Socialists, although they lost their rank as largest party in the country, nevertheless increased their vote and gained 69 seats in the Chamber. The Communists more than doubled their representation in the House, jumping from 9 to 23 seats. The middle-of-the-road Liberal party paid the bill, retaining only 17 seats, against 33 in the old Parliament.

This outcome of the eagerly awaited election was disappointing to all concerned inasmuch as it did not alter the political balance, but made it more precarious instead. Paradoxically, the only real winner of the day was the only loser of the electoral

battle, the Liberal party, whose support now was more indispensable than ever for any government wanting to get a majority in the evenly divided House.

The situation was made even more equivocal by the subsequent senatorial elections at the end of February. These gave the Christian Social party 83 seats in the 167-man Senate, as compared with 55 Socialist, 17 Communist, and 12 Liberal seats, a total of 84 for the coalition previously in power.

Even before the Senate vote, Premier Van Acker and his Cabinet handed in their resignations to the Regent on February 18. Prince Charles, in accordance with parliamentary tradition, then asked the leader of the victorious Christian Social party, Auguste E. de Schryver, to explore the possibilities of a right-wing government. The Catholic leader, however, was unable to enlist the support of any other political group in Parliament, although a Liberal spokesman, the day after the general election, had declared, "We are prepared to make an alliance with the Catholics or the Socialists—it all depends on what is offered to us."

The Regent thereupon asked Paul-Henri Spaak, president of the United Nations General Assembly, to undertake the formation of a new left-wing coalition government. M. Spaak, however, proved likewise unable to satisfy the Liberals. He attempted then, with the Regent's blessing, to form a minority government based on his own party, the Socialists, alone, with the inclusion of some "technicians." Having completed his team on March 14, he presented it, five days later, to the new Chamber with the words, "If you think you can quickly give the nation a government other than that now before you, stronger and based on a stable majority, do not hesitate to turn us out." This the House promptly did at the first test vote, on March 20.

After De Schryver once more had tried and failed, Prince Charles turned again to the former Premier Van Acker, who eventually succeeded in putting together a new coalition Cabinet composed of six Socialists, six Liberals, four Communists, and three independents. The Cabinet was approved by the Chamber on April 4, and by the Senate on April 11, in the latter by a majority of only two votes.

**Government on a Razor's Edge.** The political crisis—one of the longest in Belgian history—was solved, but the underlying problems remained unsettled and a relapse into the former state of instability was apt to occur at any moment. Van Acker, therefore, made it clear to the three parties supporting him that he would ask for a grant of special powers, so that his Cabinet would not be in daily risk of being overthrown on any pretext at hand.

The Chamber granted him these special powers, which were mainly in the economic and financial fields, but only because the moderate Liberal party, with its disproportionately large representation in the Cabinet had a solid grip on economic affairs, thus making any Socialistic experiments impossible.

Even so the new government, with its razor-thin majority in the Senate, and an uncomfortably small one in the Chamber, remained constantly at the mercy of a chance adverse vote.

It weathered a serious storm in May, when its refusal to grant wage increases caused a series of strikes, especially among coal miners and longshoremen, and a threatened general strike was narrowly averted.

It also came unscathed through a new crisis over Leopold, in June, when it turned down a formal request by the King that his wartime responsibilities

be examined by a special nonparliamentary commission.

But it stumbled and fell, on July 9, over an issue so unimportant and obscure that hardly anyone outside of Belgium could understand what the new crisis was about. Briefly, there had arisen a controversy between the Minister of Justice, Adolphe van Glabbeke, a Liberal, and an influential Socialist Senator, Henri Rollin, who charged the former with illegal intervention in a treason case pending before a military court. Premier Van Acker backed his Minister of Justice and demanded a vote of confidence, from which Rollin and two other Socialists abstained, with the result that the Senate by a majority of one vote denied the expression of confidence sought by the Government. The latter thereby was compelled to resign.

Again the crisis lasted for several weeks, following pretty much the same course as the earlier one. Finally, on August 6, a new three-party coalition Cabinet, this time headed by the veteran Socialist leader Camille Huysmans, presented itself before Parliament and was approved by a slender majority. Originally considered a stop-gap government only, it nevertheless outlasted its predecessors during the year. The composition, policies, and practices of the new Cabinet were virtually identical with those of the outgoing government.

Municipal elections were held throughout Belgium on Nov. 24, 1946, in which women for the first time were allowed to participate. Contrary to general expectation, the feminine vote did not materially affect the political balance, which remained as precarious as before. The Christian Socialists made some gains, particularly in the big cities, but their success was inconclusive. The Liberals managed to recoup some of their losses sustained at the February poll.

On Nov. 28, the government narrowly escaped defeat in the Senate when a budgetary measure proposed by the Communist Reconstruction Minister Jean Terfve was defeated by an 82-82 vote, two government supporters being absent due to illness. When the Cabinet refused to admit that a tie-vote was tantamount to a vote of no-confidence, the Christian Socialist Senators walked out in protest. The crisis, however, was again smoothed over and the Huysmans Cabinet remained in power through the end of the year.

**Economic Prosperity.** With all this political instability, Belgium remained in the forefront of those relatively few European countries which were able to recover quickly from the effects of war and occupation. Even at the start of the year Premier Van Acker was in a position to state that Belgium had "the best production of coal, gas and electricity, the best output of textiles, the best food, the best financial situation, the most orthodox budget, and the best public-debt position" of any liberated country in Europe.

In spite of recurring strikes and high prices, this economic recovery was not only sustained, but improved during the year. The threat of inflation, which loomed large in the spring, was effectively banned by Van Acker's strict price and salary policy and through drastic taxation, syphoning off excessive purchasing power.

By the end of the year, production had reached, or was approaching, pre-war levels in many fields; there was virtually no unemployment. Inbound shipping in the port of Antwerp, during the first nine months of 1946, reached 5,880,000 tons, as compared with 6,840,000 for the same period in 1938. On the other hand, outbound cargo totaled only 1,330,000 tons during the same period, or

approximately 20 percent of the pre-war figure. This disparity reflected the government's policy of priming the national economy through generous imports of raw materials for industrial use, and of enough consumers' goods to prevent uncontrollable price rises. It naturally placed a heavy strain on the country's foreign exchange reserves, but the Government hoped to build these up again through a subsequent increase in exports. However, a large portion of the gap between the figures for outbound shipping in 1938 and in 1946 was accounted for by the complete absence of shipments from Germany, which in peacetime made up a substantial part of Antwerp's harbor traffic.

Belgium's once large and profitable tourist trade did not resume in 1946 to the anticipated extent, but remained at about 10 percent of prewar levels. This was due chiefly to the high cost of living, which caused prospective tourists, especially the British, to go to Switzerland or other countries rather than pay the prohibitive prices currently asked during the year 1946 at the once popular Belgian resorts.

**Belgium's Role in World Affairs.** Under the guidance of its able and energetic Foreign Minister Spaak, who was retained in this capacity in the successive Cabinets, Belgium in 1946 again played an active role in international affairs.

In August, at the Paris Peace Conference, M. Spaak strongly urged the Big Four to abide by any recommendations made by a two-thirds majority of the delegates; his stand was heartily endorsed by Secretary of State Byrnes on behalf of the United States.

On September 8, Spaak expressed whole-hearted approval of the policy toward Germany set forth by Secretary Byrnes in his Stuttgart address; M. Spaak also called on Soviet Russia to be less mysterious, and more cooperative in her European policies.

Along with the governments of the Netherlands and Luxemburg, the Belgian Government on November 1 asked the Big Four for a voice in the forthcoming German peace settlement "from the beginning."

Belgium also made positive contributions to the work of the United Nations. In October, she submitted for approval by the General Assembly a draft trusteeship agreement governing her African mandate of Ruanda-Urundi.

Twice during the year, Belgium's long-standing dispute with Franco Spain over the protection given by that country to the Belgian Fascist leader Léon Degrelle was brought up before the United Nations. In May, Foreign Minister Spaak charged in a note to the Security Council that Spain had become a haven for former Axis agents and that "the collusion of the Spanish Government with these elements is likely to call into being a dangerous center of agitation against the nations which won the war."

On August 22, Degrelle disappeared from Spain under circumstances which strongly suggested that the Spanish Government had helped him to escape to an overseas destination, as charged in a Belgian note of September 4. In its reply the Spanish Government admitted knowledge of Degrelle's whereabouts, but it refused to divulge this information "out of courtesy to the country in which he is now residing and which might be brought into conflict with Belgium." In mid-October, the Belgian Government lodged a new protest with the United Nations, in which it accused the Franco regime of "publicly and officially" helping to hide the notorious traitor.

Meanwhile, Degrelle's wife Marie had been brought to trial before a Brussels court which, on May 14, sentenced her to a ten-year prison term on charges of having been an active collaboratorist in her own right.

**Production.** Previous to the war Belgium's manufacturing, mining, intensive agriculture, and extensive foreign commerce enabled it to support one of the densest populations of Europe (712 per square mile on December 31, 1938). The area under cultivation was substantially expanded in 1941 and 1942, but showed a marked decrease in 1944 and 1945. Leading crops are wheat, rye, oats, potatoes, and sugar beets. Production of meat fell in 1944 to less than one-third of the prewar output; that of butter, margarine, and sugar also showed a marked decrease. Belgium possesses large mineral resources, especially coal, iron, and zinc ores. The annual output of coal was reduced from 23,742,966 metric tons in 1943 to 13,504,950 in 1944. Belgium was also an important prewar producer of glass, paper, cardboard, cement, cotton yarn, rayon, metal products, alcoholic beverages, etc.

**Foreign Trade.** Belgium's foreign commerce in terms of money was drastically reduced during the war, from an average of 3,700,000,000 francs per month in 1939 to 750,000,000 francs in 1944. The decrease in quantity was even greater, if the rise of prices during that period is taken into account. Imports in 1944 averaged 305,000,000 francs a month, exports 452,000,000.

**Finance.** Revenue for 1945 was estimated at 16,000 million francs and expenditures at 40,000 million francs. The Belgian franc was fixed at 178.6 to the £ sterling on October 5, 1944. Belgium's domestic debt, rising steadily, reached 187,000 million francs in September, 1945.

JOACHIM JOESTEN.

**BERMUDA.** A British colony in the Atlantic, 677 miles southeast of New York. The Bermuda area includes some 360 islands, of which about 20 are inhabited. Area, 19.3 square miles. Population (1944 estimate) 33,925. Capital, Hamilton. The colony is administered by a governor, assisted by an executive council and a legislative council, both consisting of appointed members, and an elected House of Assembly of 36 members. Women received the vote in 1944.

In January, 1946, the Assembly and the Legislative Council passed a railway purchase bill for the nationalization of the railway system. In August the Legislative Council passed the motor car bill, yielding to the House of Assembly after a controversy of several years, and the use of motor cars in Bermuda was thus legalized after 38 years. Trucks from United States bases had been in operation, however, and charges that they were operated at excessive speeds were brought in the Council while the motor car bill was under consideration. In November, 1946, the Finance Committee recommended to the Assembly the introduction of an income tax in 1947. Bermuda's new Governor and first naval Governor, Admiral Sir Ralph Leatham, reached Hamilton on May 9 and was sworn in on that day.

Tourists are an important source of income in Bermuda. The chief agricultural products are bananas, lily bulbs, potatoes, onions, and green vegetables. At the same time meat, flour, and other food products are imported from the United States and Canada. Customs duties are by far the largest source of revenue. Estimated expenditure in 1945 (£859,800) exceeded revenue (£784,100). Education is compulsory from the ages of 7 to 13.

**BIKINI TESTS.** The atomic bomb tests at Bikini, known as "Operation Crossroads," were scientific experiments by the United States Government. The general specifications for the tests were laid down by the Joint Chiefs of Staffs, Admirals Leahy and Nimitz, Generals Eisenhower and Spaatz. By their direction, with the approval of the President, the Army and Navy and qualified civilian scientists were joined for the tests to form a unit which was known as Joint Task Force One. The Chiefs of Staff appointed Vice Admiral W. H. P. Blandy, USN, to head the Task Force. A naval officer was chosen to command the Force because the great majority of over 40,000 personnel taking part in the tests were necessarily naval, and nearly 200 ships were involved. Admiral Blandy's staff was composed of top flight civilian, Army, and Navy personnel: Major General W. E. Kepner, AUS, Deputy for Aviation; Rear Admiral W. S. Parsons, USN, Deputy for Technical Direction; Major General A. C. McAuliffe, Ground Forces Advisor; Dr. R. A. Sawyer, Technical Director; Captain J. A. Snackenberg, USN, Chief of Staff; Captain R. Brodie, USN, Assistant Chief of Staff for Personnel; Brigadier General T. J. Betts, AUS, Assistant Chief of Staff for Intelligence; Captain C. H. Lyman, USN, Assistant Chief of Staff for Operations; Brigadier General D. H. Blakelock, AUS, Assistant Chief of Staff for Logistics.

The Mission of Joint Task Force One was primarily to determine the effects of the atomic bomb upon naval vessels, the information to be used for national defense, and the results translated into terms of United States sea power.

The secondary purposes were to afford training for Army Air Forces personnel in attack with the atomic bomb against ships, and to determine the effect of the atomic bomb upon military installations and equipment. The Army Air Forces, making the actual air drop, also participated actively in the air transport, collection of data, observation of results, and test of air force equipment phases of the operation.

The date for the first test was set as May 15, 1946, and later was changed to July 1, 1946, by order of the President. The location, Bikini Atoll in the Marshall Islands, is 2,000 miles southwest of Hawaii. In the lagoon of this atoll—roughly 20 miles long and 10 miles wide—a target fleet of approximately 100 ships, made up of prize German and Japanese ships as well as surplus United States naval vessels was to be anchored. The bomb was to be dropped to explode over target ships at an altitude of several hundred feet.

The second test was to occur tentatively about July 25, or about four to six weeks after the first, depending upon the time needed for rearranging target ships and installing additional instruments. The bomb was to be placed below the surface of the water amidst the target ships. Terrific air blast and heat was predicted when the bomb exploded, as well as heavy underwater pressures, shock to the hulls of the ships, and very high waves.

The third and final test was to be held in 1947, with the target ships in the open sea, as the bomb was to be exploded at a depth impossible to attain in a harbor. The more difficult technical preparations for this experiment, including the design, construction, and testing of a bathysphere in which to submerge the bomb to a great depth, and the means for keeping the target ships in position on the open ocean, made it impossible to hold this third phase during the same period as the first two. This test, however, was canceled on September 6, 1946.

By March 11, 1946, Bikini Atoll was completely evacuated of its native population of 167 men, women, and children, who were moved to Rongerik Atoll, a previously uninhabited island 109 miles east of Bikini, in the Marshall Islands.

In January, 1946, one of the Navy's surveying vessels left San Francisco with a party of oceanographers, biologists, and geologists to conduct a thorough investigation of the Bikini Atoll. Hydrographic surveys were made to check and extend captured Japanese charts. Coral heads or peaks were blasted to permit placing of ships at specified locations.

The observation of animals, under the direction of Captain R. Harold Draeger, Medical Corps, USN, (working from the Naval Medical Research Institute at Bethesda, Maryland), was to supply vital data. The animals to be placed under observation included 200 goats, 200 pigs, and approximately 4,000 rats. Just prior to the dropping of the first atomic bomb, they were distributed aboard 22 target ships in positions normally occupied by the ships' crews.

The *USS Bursleson*, Navy attack transport, was equipped with elaborate laboratories for studying the biological effects of various types of blast injuries—air blast, water blast, solid blast, and radiation blast, plus secondary effects the bomb might have on personnel.

Some of the goats were covered with anti-flash creams for thermo-heat tests; others were clipped to hair lengths similar to that of humans. Blood studies were made on the animals before and after the tests. Radiation sickness was studied and treated in various stages to determine the best methods of therapy. The animals were tattooed and notched for accurate records. Kept under constant observation they were eventually brought back to the Naval Medical Research Institute at Bethesda where studies are being continued until their natural deaths. What scientists know of X-ray burns formed the basis of the study of the radiation blast. The radiation blast from the atomic bomb knocks out bone marrow and affects the spleen (the basis of the white blood cells).

Other tests were made with the use of vaccines, viruses, toxins, antisera, bacteriophage, hormones, and vitamins. The effects on medical and dental equipment and supplies were also studied.

The scientific program called for an oceanographic and biological survey of Bikini Atoll and surrounding areas for six weeks, beginning early in March. The survey also included an inventory of the kinds and quantities of fish which was used as a basis of comparison for studies of the effects of the explosions.

Sea disturbances were studied in detail. The reactions of the waves and surf, which contained valuable information, were studied as an aid to amphibious operations during the war. More than 100 instruments of a dozen different types, weighing nearly 40 tons with their tackle, were used by the wave measurement staff of 33 oceanographic engineers and other specialists. Much of the equipment was of new type designed and constructed especially for the test. It was installed on airplanes, islands, ships, and the sea bottom to determine the height, speed and length of the waves generated by the blast.

Instruments on special buoys made an automatic record of the changing distance to the ocean floor as the waves went by. A network of recording pressure meters were placed on the bottom of the lagoon to determine the pressure caused by the waves, from which the height of the waves was

then calculated. Aerial cameras, installed on towers and in airplanes and operated by remote control, photographed the waves every second until the disturbance died out. Some cameras were equipped so that they were started by the light from the bomb burst. Seismographs on the island of the atoll recorded the effect of the bomb and of any submarine landslides caused by the explosion.

Special wave recorders on more distant atolls, such as Kwajalein, were installed to detect the minute wave effects which might be produced at such distances.

The target ships were to be so placed that there would be graduations of damage from maximum to negligible. The ships that were sunk contributed valuable information. Some of this was obtained by aerial photography, indicating the character of the damage and the time required to sink. More definite information about damage was obtained by divers and underwater photographs. In the next group would be ships which were severely damaged but did not sink. It was from these heavily damaged ships that the greatest amount of important technical information was obtained. Finally there were ships placed so far from the explosion that they received only minor damage, or none at all.

To gather information, about 1,000 scientists and their assistants utilized 7,000 instruments of measurement and record to make these tests among the most thoroughly analyzed experiments that have ever been held. The Instrumentation Group under Admiral Parsons and Dr. R. A. Sawyer installed the thousands of devices that recorded the detonation of the atomic bomb, graphically, photographically, electronically, and radiometrically.

The first problem of measurement was to measure the bomb as a bomb. That is, to measure it as TNT, or any other high explosive, for blast, pressure, shock, heat, and fragmentation. The second problem was to record the bomb's effect on the ships. The unique problem that existed in the case of ships, as contrasted with cities and other land targets, is that while no building stands a thirty degree roll a ship is built to stand such a roll. The third problem concerned the oceanographic factors of wave motion, seismic changes, wave patterns, currents, and changes in the ecology, or equilibria among living things in the area. The fourth and last problem of measurement was concerned with the energy released by the atomic bombs in terms of electrical changes in the atmosphere in radiometry, radiation, and radioactivity. Very little data has been released concerning these headings. Scientists of the Los Alamos Laboratory of the Manhattan Engineer District worked with other scientific laboratories of the Army and Navy on this problem.

A number of converted LCVPs were completely equipped for drone operation, including radio-controlled pumps. Two drones were controlled jointly by an Avenger torpedo bomber from the USS *Shangri-La*, which flew outside the danger area, and by a mother ship, an old-type destroyer, cruising outside the lagoon. When Geiger counters installed aboard the boats indicated that the drones were in the area of greatest radioactivity, a special radio-control aboard the mother ship started the drones' pumps lifting samples from the water's surface. They then made radiological reconnaissance throughout the contaminated lagoon waters to determine when it was safe for damage control crews to enter the area.

Some of the drones were sent into and through the huge pillar of smoke from the explosion to ob-

tain data as to the nature, physical properties, and effects of the blast and its attendant smoke column. Cameras trained on the televised image of instruments in the drone provided a permanent recording on film of instrument readings.

The greatest battery of cameras ever assembled—four hundred and fifty, exclusive of press cameras—took approximately 50,000 stills and 1,500,000 feet of movie films of the bomb tests. The world's largest aerial camera was used—a modified AAF K-18 five feet long, equipped with a 48-inch telephoto lens, and capable of recording legibly on film the dial of a wrist watch photographed a quarter of a mile away.

The placement of the cameras was a problem, for they had to be protected from the force of the atomic explosion and accompanying radioactivity. The solution was to place the cameras in three locations, on six 75-foot steel towers, installed on three islands of the Bikini Atoll, on target and observer ships, and in aircraft.

**Test Able.** During June the target ships were placed in position for the first test; instruments were installed and all phases of the experiment were made ready. Daily weather conferences were held, and on June 30 the aerologists predicted a fine day for July 1. Accordingly, on June 30 more than a hundred ships of the task force stood out to sea, each to remain within an assigned area.

At 8:45 a.m. the bombing plane, the B-29 "Dave's Dream" began its bombing run. Throughout the entire task force the tension mounted for although scientists had predicted what would happen, no one was quite certain what the results would be.

Atomic fury broke over Bikini lagoon at 9 a.m. as the world's fourth atomic bomb detonated. There was a ball of fire that broke over the lagoon, a ball of fire with electric sparks on the edges, bright and dazzling like an angry sun. Another followed it, so quickly, so transitory, that the second burst seemed like an illusion. Both these bursts of giant balls of fire illuminated Bikini.

The atomic cloud that followed churned upward thousands of feet in seconds. The cloud was brown with white patches at first. Then it began an amazing transformation in colors and shapes. It seemed to steam and boil and churn at the bottom. There it turned white. It was pinkish in the middle, salmon colored at the top.

In less than two minutes it climbed over 20,000 feet. The mushroom broke out suddenly at the top and the cloud changed colors. It was a fascinating picture. Then it broke into two mushrooms, the second one a quarter of the way from the crest. All this time the trade winds were driving it hard. In thirty minutes the cloud began to disintegrate into a crazy pattern of Z's. In an hour, the wind had so battered it that it was hard to recognize.

Late in the afternoon the ships of the inspection fleet reentered the lagoon and task force personnel began the huge task of assembling and analysing the results of Test Able.

**Test Baker.** For the second test, the bomb was suspended in the water from a small LSM, designed originally to land tanks on an open beach. This little ship had been altered to provide a well in the bottom through which the caisson containing the bomb could be lowered.

As in Test Able, the "last-minute" men from the ships and islands were collected at dawn. This time there was another job to be done. The various devices for firing the bomb on board the LSM has to be checked and set. A clockwork mechanism actuated by more than one clock, made it impos-

SCENE OF BIKINI ATOM BOMB TESTS

Official U.S. Navy Photograph

sible to fire the bomb before a certain time, nor after a certain later time. Furthermore, stray radio signals could not explode the bomb. Certain specific signals sent on the required frequencies and in the intended sequence, were necessary. All these timing signals were sent from a specially equipped ship.

These early morning operations determined "H" hour for the explosion. It was low tide at 7:20 a.m. and it was desired to detonate the bomb as soon after this time as possible, to minimize the waves reaching the islands. 8:35 a.m. was the earliest time that could be arranged, and as it happened, the bomb was exploded at exactly that time.

The fantastic power and heat of the world's fifth atomic bomb churned Bikini lagoon into a cauldron of flame and smoke and steam which completely obscured the fate of ships lying at anchor.

The massive burst was a spectacular thing to see, for the lagoon was calm and placid one moment and then next came the great spout of water, smoke and vapor shooting into the heavens. Mighty waves rose with the blast, but they did not roll over Bikini Island. The column appeared to be a half mile in diameter and appeared to reach a height of five to six thousand feet.

The water first erupted in a colossal geyser. The column was perfectly rounded and was dark brown in color as it rose into the sky. Then came the second phenomenon of the atomic underwater burst. Suddenly, from the base of this water column, burst a gigantic domeshaped mushroom of smoke vapor which hung like a cap over the cloud mass, and then disappeared.

All of these things happened in a few seconds, and then from the surface of the sea rose a great mass of steam which covered almost the entire fleet with a white fleece through which it was impossible to see.

Ten minutes after the blast thick white clouds still were hanging over the ships. By 8:45 a.m. the mist over the lagoon was settling and the target area could be made out.

Due to the intense radioactivity of the water

in the lagoon many days passed before all of the target ships could be surveyed and scientific data gathered from them.

**Results of Test Able.** The accuracy of the drop was such that the explosion occurred within the area included within the allowance for the probable error of the elevation of drop, and detonation was probably within 100 feet of the chosen altitude. Nevertheless, the explosion actually occurred several hundred yards west of a point directly above the target ship Nevada and therefore entirely west of the closely spaced array of capital ships.

There were 90 targets anchored in the lagoon when the bomb exploded. These were not in battle formation but were placed in positions to give the largest amount of desired technical information with especially close concentration around the center target point. Those ships anchored a mile or more from the point of drop largely escaped injury. Those within a mile were sunk or suffered damage varying with the distance from the point of detonation and with the type of ship construction. On explosion, a destroyer and two transports sank promptly. A second destroyer and the Japanese cruiser, *Sakawa*, sank within 27 hours. The light carrier, *Independence*, was gutted with fire and resultant explosions. The submarine *Skate* was heavily damaged and later towed away. All of these were near the point of explosion. The other ships, including the only two capital ships which were within one-half mile of the detonation, received damage that would require more or less complete overhaul and in most cases repair at major bases before they could again be used for combat. A study of this damage is helping point the way to changes in design which should minimize damage from blast and heat. Beyond these ships there was extensive damage to superstructure, radar, and fire control.

No wave or blast damage could be noticed on Bikini Island, which is approximately three miles from the point of detonation. In general, the observations on ship damage were confirmed by engineering surveys. The location of the bomb burst,

accurately determined from photographs, was such that only one ship was within 1,000 feet of the surface point over which the bomb exploded. There were about 20 ships within half a mile, all of which were badly damaged, many being put out of action and five sunk. It required up to 12 days to sufficiently repair all of those ships left afloat so that they could have steamed under their own power to a major base for repair.

It is now possible to make some estimate of the radiological injuries which crews would have suffered had they been aboard Test "A" target vessels. Measurements of radiation intensity and a study of animals exposed in ships shows that the initial flash of principal lethal radiations, which are gamma rays and neutrons, would have killed almost all personnel normally stationed aboard the ships centered around the air burst and many others at greater distances. Personnel protected by steel, water, or other dense materials would have been relatively safe in the outlying target vessels. The effects of radiation exposure would not have incapacitated all victims immediately, even some of the most severely affected might have remained at their stations several hours. Thus it is possible that initial efforts at damage control might have kept ships operating, but it is clear that vessels within a mile of an atomic bomb air burst would eventually become inoperative due to crew casualties.

**Results of Test Baker.** As scheduled, at 0835 Bikini time on July 25, the second bomb was detonated well below the surface of the lagoon. This bomb was suspended from the LSM-60, near the center of the target array. The explosion was of predicted violence and is estimated to have been at least as destructive as 20,000 tons of TNT.

To a degree which was remarkable, the visible phenomena of explosion followed the predictions made by civilian and service phenomenologists attached to Joint Task Force One. At the moment of explosion, a dome, which showed the light of incandescent material within, rose upon the surface of the lagoon. The blast was followed by an opaque cloud which rapidly enveloped about half of the target array. The cloud vanished in about two seconds to reveal, as predicted, a column of ascending water. From some of the photographs it appeared that this column lifted the 26,000-ton battleship *Arkansas* for a brief interval before the vessel plunged to the bottom of the lagoon.

The diameter of the column of water was about 2,200 feet, and it rose to a height of about 5,500 feet. Spray rose to a much greater height. The column reached maximum height, water fell back, forming an expanding cloud of spray which engulfed about half of the target array. Surrounding the base of the column was a wall of foaming water several hundred feet high.

Waves outside the water column, about 1,000 feet from the center of explosion, were 80 to 100 feet in height. These waves rapidly diminished in size as they proceeded outward, the highest wave reaching the beach of Bikini Island being seven feet. Waves did not pass over the island, and no material damage occurred there. Measurements of the underwater shock wave are not yet available. There were not seismic phenomena of significant magnitude.

The explosion produced intense radioactivity in the waters of the lagoon. Radioactivity immediately after the burst is estimated to have been the equivalent of many hundred tons of radium. A few minutes' exposure to this intense radiation at its peak would, within a brief interval, have incapacitated human beings and have resulted in their death.

Great quantities of radioactive water descended upon the ships from the column or were thrown over them by waves. This highly lethal radioactive water constituted such a hazard that after four days it was still unsafe for inspection parties, operating within a well-established safety margin, to spend any useful length of time at the center of the target area or to board ships anchored there.

As in Test "A," the array of target ships for Test "B" did not represent a normal anchorage but was designed instead to obtain the maximum data from a single explosion. Of the 84 ships and small craft in the array, 40 were anchored within one mile and 20 within about one-half mile. Two major ships were sunk, the battleship *Arkansas* immediately and the heavyhulled aircraft carrier *Saratoga* after 7½ hours. A landing ship, a landing craft, and an oiler also sank immediately. The destroyer *Hughes*, in sinking condition, and the transport *Falcon*, badly listing, were later beached. The submerged submarine *Apogon* was sent to the bottom emitting air bubbles and sunk. Five days after the burst, the badly damaged Japanese battleship *Nagato* sank. It was found impossible immediately to assess damage to hulls, power plants and machinery of the target ships because of radioactive contamination. There was no obvious damage to ships more than one-half mile from the burst.

**Observations and Conclusions, Both Tests.** The operations of Joint Task Force One in conducting the tests set a pattern for close, effective cooperation of the Armed Services and civilian scientists in the planning and execution of this highly technical operation. Moreover, the tests provided valuable training of personnel in joint operations requiring great precision and coordination of effort.

It is impossible to evaluate an atomic burst in terms of conventional explosives. As to detonation and blast effects, where the largest bomb of the past was effective within a radius of a few hundred feet, the atomic bomb's effectiveness was measured in thousands of feet. However, the radiological effects have no parallel in conventional weapons. It is necessary that a conventional bomb score a direct hit or a near miss of not more than a few feet to cause significant damage to a battleship. At Bikini the second bomb, bursting under water, sank a battleship immediately at a distance of well over 500 feet. It damaged an aircraft carrier so that it sank in a few hours, while another battleship sank after five days. The first bomb, bursting in air, did great harm to the superstructures of major ships within a half-mile radius, but did only minor damage to their hulls. No ship within a mile of either burst could have escaped without some damage to itself and serious injury to a large number of its crew.

Although lethal results might have been more or less equivalent, the radiological phenomena accompanying the two bursts were markedly different. In the case of the air-burst bomb, it seems certain that unprotected personnel within one mile would have suffered high casualties by intense neutrons and gamma radiation as well as by blast and heat. Those surviving immediate effects would not have been menaced by radioactivity persisting after the burst.

In the case of the underwater explosion, the air-burst wave was far less intense and there was no heat wave of significance. Moreover, because of the absorption of neutrons and gamma rays by water, the lethal quality of the first flash of radiation was not of high order. But the second bomb threw large masses of highly radioactive water onto the decks and into the hulls of vessels. These contaminated

ships became radioactive stoves, and would have burned all living things aboard them with invisible and painless but deadly radiation.

Observations during the two tests have established the general types and range of effectiveness of air and shallow underwater atomic-bomb bursts on naval vessels, army material, including a wide variety of Quartermaster stores, and personnel. From these observations and from instrumental data it is now possible to outline such changes, not only in military and naval design but also in strategy and tactics, as future events may indicate. See separate articles on ATOMIC ENERGY, MILITARY PROGRESS, NAVAL PROGRESS, and PHYSICS.

W. JEROME HAGERTY.

**BILLIARDS.** Irving Crane of Livonia, New York, a former champion, regained world pocket billiard honors when he led a field of eight cue artists at Philadelphia last December. Winning six of his seven matches, Crane dethroned Willie Mosconi, Barrington (New Jersey) master, who was the runner-up. Earlier in the year, Mosconi had successfully defended the title by defeating Jimmy Caras of Wilmington, Delaware, 8,727-7,508, in a cross-country challenge match.

No play was held for the world three-cushion crown worn by Welker Cochran of San Francisco. Biggest event of the year in that type of competition was the 1,000-point match between Willie Hoppe, the aging Boy Wonder, and Jake Schaefer, Chicago ace, Hoppe winning by 1,000-788.

Edward Lee of New York did not defend his national amateur three-cushion laurels last Winter and that title went to Robert Lord of Chicago.

THOMAS V. HANEY.

**BIRTH CONTROL.** In the first full year after the end of the war, planned parenthood was increasingly recognized as an important ingredient in peace. The reason was expressed succinctly by Dr. Djamil Tutunji, Director of Public Health of Transjordan, speaking before the International Health Conference of the United Nations in New York.

"The control of the birth rate," said Dr. Tutunji, "is as important as the control of the atomic bomb."

While the atomic bomb received more attention, the progress of planned parenthood in all its various aspects—birth control, treatment for infertility and education for marriage—was considerable. As a program to help people to meet the requirements of modern life, it had come of age with the Planned Parenthood Federation of America preparing to launch a campaign to raise \$2,000,000 to expand its services and those of the 33 state leagues and 350 local committees, affiliated with it.

**Medical and Clerical Support.** The growth of planned parenthood as a factor in family well-being and community security was stimulated by the support which it received during the year from professional groups. An outstanding example of this was a resolution signed by 3,200 Protestant and Jewish clergymen from every state in the union, endorsing planned parenthood services and urging their adoption by hospitals and other health and welfare organizations in every community.

The clergymen took the stand that it was a "fundamental democratic right" for them to insist that these services be supplied. The signers included a great many nationally known religious leaders.

Also during the year the Committee on Public Health Relations of the New York Academy of Medicine announced the results of a survey which it had made of contraceptive services in New York

City. It found that only five hospitals had contraceptive clinics, and that they were so little used that a single Planned Parenthood center, the Margaret Sanger Research Bureau, assisted twenty-five times as many patients as all five hospitals put together.

The report of the committee, therefore, recommended that private physicians, hospitals and health authorities should assume the responsibility for providing contraceptive advice when it is medically justified. The report also recommended improvement in teaching child spacing methods in medical schools. The recommendations were approved by the Council of the Academy.

**Expansion of Services.** During 1946, Virginia and Mississippi incorporated child spacing information into their public health programs. This brought to seven the number of states which offer this service to their people. The others are North and South Carolina, Alabama, Florida, and Texas. Massachusetts and Connecticut remain the only two states in which contraceptive information, even by a physician to his patient for obvious health reasons, is illegal.

Despite the curtailment of the program dictated by war conditions, the total number of centers in the country stood at 568. This was just thirty years after Margaret Sanger established the first American birth control clinic in Brooklyn in 1916.

The service offered by many of these clinics was also expanding. One of the comparatively new fields was treatment for infertility, which was being undertaken in a number of centers. During the year the Connecticut Planned Parenthood League made a grant of \$2,500 to Yale University for infertility research.

Marriage counseling and sex education were also expanded as part of the general planned parenthood program. Increasing recognition was given to the importance of this program in developing mental hygiene and in combatting juvenile delinquency. It was significant that a representative of the Planned Parenthood Federation took part in the conference on juvenile delinquency called by the Department of Justice in Washington.

The Federation, which remained the principal advocate of child spacing, continued an extensive public information program. The need for such work was emphasized by the fact that many people still erroneously believed it was illegal to give contraceptive information. This is true only in the two states mentioned before.

During 1946, therefore, the Federation distributed hundreds of thousands of pamphlets, sponsored dozens of magazine articles and radio programs, prepared a slide film for popular use and was represented at dozens of conferences.

The Federation's referral service lists 3,000 physicians to whom inquiries can be directed. This is an important phase of the program, since the Federation receives thousands of letters from parents and prospective parents in areas where no clinical service is available.

**International Developments.** The first international gathering on family planning since 1930 was held August 23-26 in Stockholm at the invitation of the Swedish National Association for Sexual Education. The three Scandinavian countries, Finland, England, the Netherlands, and the United States were represented. Margaret Sanger headed the delegation of four from this country. Resolutions were adopted declaring:

- (1) That it is the right of parents to decide the number of their children;

(2) That it is the right of the people to obtain scientific information on control of conception;

(8) That it is the right of youth to receive scientific sex information as part of general education;

(4) That institutions of higher education should train educators for this work;

(5) That there is an urgent need for scientific research in the field of human fertility and the development of reliable and universally applicable contraceptive methods

Reports at the conference showed the status of birth control in various countries. Family planning organizations were abolished in the Netherlands, Norway, and Denmark by the German invasion. They are being restored in the first two. England has 57 clinics under the auspices of the Family Planning Association and several Mothers' Clinics established by Dr. Marie Stopes. The Swedish Association has a large membership and three clinical centers. There was no organized birth control or marriage education work in Finland, but the Finnish delegate, Dr. Leo Kaprio, reported that he had been carrying on an active program himself. All of the European countries were handicapped by lack of supplies.

D. KENNETH ROSE.

**BOBSLEDDING.** One of the most picturesque of the Winter sports, bobsledding, which had been inactive since 1942, was resumed last year when Lake Placid's big Olympic run on Mount Van Hoevenberg was reopened. Looking ahead to the Olympic games, and with utter disdain for the dangers to life and limb, the most daring of our American drivers furnished many week end and holiday thrills for Winter sports enthusiasts.

Star driver of the season was Bill Linney, who capped the best year of his colorful career by piloting the Republic Miners of Iron Mountain, New York, to the national A.A.U. 4-man championship. His team-mates were Bill Stacovich, Rufus Brickey and Tom Hicks. The Miners, with Linney in the driver's seat, also listed victories in the North American and Lowell Thomas International Trophy races among their achievements last Winter.

Tuffield Latour and Dick Morse of the Saranac Lake Bobsled Club won 2-man laurels in both the A.A.U. and North American tests and Stanley Benham piloted Lake Placid B.C. teams to triumphs in the national A.A.U. junior 2-man and 4-man events.

THOMAS V. HANEY.

**BOK FOUNDATION.** The Mary Louise Curtis. A philanthropic organization which has as its principal activity the support of the Curtis Institute of Music in Philadelphia. Grants have also been made to the Settlement Music School, Philadelphia, and the Research Studio, Maitland, Florida, the latter being a kind of "laboratory" for painting. Financed by gifts of \$12,500,000 from Mrs. Mary Curtis Zimbalist, the Foundation was created in 1931 for the support of music, fine arts, science, invention, or general education. Address: 1726 Locust Street, Philadelphia 3, Pennsylvania.

**BOLIVIA.** A republic of South America. Area: 416,040 square miles. Population 3,595,700 (1943). Capital: Sucre is the seat of the Supreme Court and nominally the capital, but La Paz, the largest city, is the actual seat of the Government.

About three-fifths of Bolivia is composed of tropical lowlands, the remainder of high plateaus and mountains. Humid tropical climate prevails in the lowlands, temperate in the plateau areas, and varying extremes of cold at altitudes above 13,000 feet.

**Government.** Bolivia is a centralized republic of 9 Departments, under the Constitution of 1938,

which was amended by a Constituent Assembly elected in July 1944. The Constitution provides for a bi-cameral Congress: a Senate of 27 members (3 from each Department), elected for 6-year terms one-third elected every 2 years; and a Chamber of Deputies of 110 members, elected for 4-year terms, one-half retiring every 2 years. Regular sessions of the Congress open on August 6 of each year for a 60-day period, which may be extended to 90 days when desired. The President is elected for a 6-year term, and is assisted by a Cabinet of 9 ministers.

**Events, 1946.** Bolivia was torn by a violent and victorious revolution on July 21 that overthrew the Government of President Gualberto Villarroel, who was killed and hanged from a lamppost in La Paz after being thwarted in his last moment attempt to escape by airplane to Chile. The revolt, which had been festering for several months, culminated a week-long series of abortive uprisings and severe repressive measures by the Government.

President Villarroel's name rose to uneasy prominence in March when the United States Blue Book on Argentina accused Argentine-Axis forces of steering the President into power during a revolution that was allegedly instigated by Victor Paz Estenssoro, Finance Minister and head of the Government MNR (Movimiento Nacionalista Revolucionario) party. In December, 1943, Villarroel led a military coup of army officers and the MNR party that deposed the Government of General Enrique Pañaranda and established a revolutionary junta. Later, the junta was dissolved and a Constituent Assembly, with an MNR majority, elected Villarroel Constitutional President in 1944.

Independent Bolivian newspapers picked the Blue Book as a cue and fruitlessly demanded that MNR representatives leave the Cabinet. Villarroel attempted to quiet the dissatisfaction with an announcement that all political refugees, including former President Pañaranda, were free to return to Bolivia. The invitation was ignored and José Antonio Arze, leader of the opposition PIR party, continued to maintain his "Democratic Anti-Fascist Committee of Bolivian Exiles Residing in Chile" whose ultimate aim was "to extirpate Nazi-Fascism in Bolivia and to establish an effectual democratic regime."

Familiar signs of Government-public dissonance were further evident. In the early morning of April 22 troop movement and gun-fire echoed in the streets of La Paz. On April 29 Villarroel summoned the editors of the opposition newspaper to the Presidential Palace and informed them he was aware of a conspiracy and was capable of stamping out any revolt. During the next two days the Government arrested several oppositionists and clamped strict censorship on newspapers.

The arrests were accompanied on April 30 by an official communique stating that a coup, aimed to prevent the May 5 elections for renewal of half the Chamber of Deputies and one-third of the Senate, was frustrated. During this situation, the communique said, "indispensable security measures have been kept to a minimum, without affecting the atmosphere of freedom required for the election." The opposition Democratic Front immediately announced their refusal to participate in the elections.

A state of siege, suspending all Constitutional liberties, was established on May 30 after Villarroel claimed the discovery of another plot. The May 5 Congressional elections resulted in a landslide victory for the MNR. The Government prohibited all political meeting on June 4 and engaged in a further wave of political arrests, which in-

cluded Senator Waldo Belmonte, leader of the Republican Socialist Party; Enrique Hertzog, leader of the "Genuine" Republican Party; Julio César Canelas, publisher of *El Diario*, and Jorge Candeco Reyes, publisher of *Ultima Hora*.

Uprisings flared on June 14 and 18 as army officers who tried to capture airfields in the La Paz area were captured or killed by Government forces and civilians armed for the occasion. During this June period of sanguinary fighting, censorship on all forms of communication hid the details of the revolt from the outside world. *La Razon* and *Ultima Hora* were branded organs of sedition by the Government which thereupon nationalized both newspapers.

During the mounting opposition to the Villarroel regime, the political antagonism was doubly irritated by a serious currency inflation and a rising cost of living. On July 13 a demonstration by school teachers, who were striking for higher wages, was joined by university students. As the crowds moved through the La Paz streets, the police opened fire. The revolutionary force, led by university students and swelled by an estimated 35,000 members of the Workers' Federation, gathered momentum. Crowds stood before the Presidential Palace shouting for a civilian Government. By the 20th of July La Paz was gripped by a full-scale revolt. Villarroel tried to placate the crowds by appointing a new Cabinet, composed entirely of military officers. On the 21st, thousands of people, some armed, swarmed through the streets of the capital and captured arsenals in the City Hall and the municipal transport headquarters. As the crowds prepared to storm the Presidential Palace, Villarroel attempted to discourage action by submitting his resignation to General Damaso Arenas, Chief of Staff. At the last moment the army deserted Villarroel and the revolutionists fought their way into the Palace, shot Villarroel and hanged his body in the streets.

Fighting continued throughout the 21st, with the dead toll rising to 280 and the wounded to 520. After the first successful phase of the revolution, bands seized weapons from the Government strongholds and deployed throughout the city and its environs, seeking leading officials who escaped.

On the night of the revolution, members of the Supreme Court, the principal of the National University, and student and labor leaders met and announced the formation of a Provisional Government headed by Nestor Guillen, dean of the Supreme Court for the La Paz district. In its second day in power, the new regime announced that it would adhere to the Bolivian Constitution, observe international treaties, and respect native and foreign capital. At the same time, it assured the populace that ample preparations had been made for any counter-revolt, especially from the tin miners, who were reportedly unsympathetic to the revolution. The new regime included in its junta Luis Gozávez, professor at the National University and representative of the students; Dr. Amiceto Solares, President of the University of Sucre and representative of the teachers, and Aurelio Alcoba, representative of the workers. All members of the military were barred from public office.

On July 24 the tin miners, the largest single labor group in Bolivia, fully endorsed the new Government.

Within three weeks of the revolution, the new Government was given recognition by Cuba, Venezuela, Uruguay, Chile, Peru, Paraguay, Argentina, and the United States. Relations between Bolivia and the United States were strengthened during August by a new tin agreement which raised the

price of the ore above the level set by the previous contract. The pack provided for shipments of 18,000 tons of tin during 1946 and increased the price one-half a cent per pound over the all-time high of 65 cents in 1944.

Diplomatic complications arose after most of the deposed Cabinet and Government officials fled to the Latin American Embassies, which traditionally offer sanctuary to political refugees. The revolutionary junta's demands for the return of important Cabinet members to stand trial was refused. After a month's discussion, fifteen of the refugees were given safe conduct passes out of the country, but twenty-one others remained in the Embassies.

Regular elections were scheduled for January 4 and on August 17, a new Government was drawn up under Provisional President Tomás Monje, Supreme Court Justice and a political moderate. The composition of the Cabinet was: Foreign Affairs, Aniceto Solares; Treasury, Luis Gozávez; Interior, Roberto Bilbao; Labor, Aurelio Alcoba; Defense, Julio César Canelas; Agriculture, José Saavedra Suárez; Economy, Eduardo Sáenz García; Public Works, Carlos Muñoz Roldán; Education, Manuel Elías.

The lamppost that was used to hang Villarroel was used again on September 27 when an angry mob lynched a former army lieutenant, Luis Oblitaz Bustamonte, after he attempted to assassinate President Monje. The would-be assassin burst into the President's office, shot his secretary, and threatened the President with a pistol as he was captured by the police. After hanging Oblitaz, the mob smashed into a jail, seized José Escobar and Jorge Eguino, police chiefs under Villarroel, and dragged them to a public square where they were hanged.

Preparations for the Presidential elections began on September 29 when the Liberal party sent notes to all political parties asking them to support the candidacy of Monje. The Liberal party asked party leaders to abstain from entering a candidate, since political fighting "at these exceptional moments would be suicide for our democracy." On November 1 the "Genuine" Republican, the Socialist Republican, and the Socialist parties nominated Enrique Hertzog, former Minister of War and Finance, as their Presidential candidate. After repeated statements by President Monje to the effect that he would not consider a nomination for President in the forthcoming elections, the Liberals chose Luis Fernando Guachalla, former Ambassador to Washington, as their Presidential candidate.

The overthrow of Villarroel brought a dangerous food crisis to Bolivia. Between July and October, Argentina, upon whom Bolivia depended for 70 percent of its foodstuffs, including grain, meat, and other staples, cut off all food supplies to Bolivia, except about 10 percent of the usual meat shipments. The Argentine Government blamed the curb on a lack of rolling stock and an oversale of available supplies. During the first post-revolution months, most of Bolivia's wheat and flour needs were met by emergency allocations from the United States. The agreement provided for the shipments of 10,000 tons of flour in August and September and 7,000 tons of flour and 8,000 tons of wheat before December 31.

The Blue Book charge that the Villarroel revolution of 1943 was instigated by Nazis received substantiation on October 29 with the release of an official document found in German archives. The "final" proof, made public by the Bolivian Embassy in Washington, showed that the revolution had been prepared in clandestine conferences between European and South American fascists

who had intended to place the blame on the United States. In elaborating on the procedure for publicizing the revolution, the document said, "When the news of the revolution is received, the German radio and press commentaries should be so worded as to decry the United States as being behind the movement, denouncing the revolutionary leaders as agents in the pay of North American imperialism, who are attempting to make Bolivia into a colony of the United States."

As a reward for their part in the July revolution, the women of Bolivia were offered the right to vote in the January Presidential elections. After meeting in a national convention in mid-November, the women declined the right, saying that they wanted more political education. During the convention, however, they adopted resolutions requesting the Government to include Catholic instruction in public and private schools, forbid the carrying of arms at election time, and postpone their enfranchisement.

**The People.** Over half of the total population of Bolivia are Indians; 32 percent are of mixed blood; 13 percent are of European descent (chiefly Spanish). Density of population per square mile ranges from 0.6 in the tropical lowlands to 28.5 in the area of Cochabamba. Largest cities are: La Paz, 301,000; Cochabamba, 60,000; and Oruro, 50,000.

Spanish is the official language, but in Indian communities native dialects are spoken.

The State religion is Roman Catholic, but other faiths are freely tolerated.

Primary education is now free and compulsory. In 1944 there were 1,740 elementary schools with a total enrollment of 144,056; 55 secondary schools had a total enrollment of 17,496. There are 6 universities in Bolivia.

**National Economy.** Mining is the outstanding industry of Bolivia. Tin is the most important mineral produced, although production is expensive because of the complex nature of the ore. During the period 1938-41, minerals constituted more than 90 percent of the total value of Bolivian exports, with tin accounting for about 70 percent. Tin production in 1945 totaled 43,147 tons. Bolivia also produces tungsten, gold, silver, copper, bismuth, lead, antimony, zinc, and petroleum.

Agriculture has not been well developed in Bolivia. About 5 million acres are estimated to be under cultivation. Productivity of the land is low and modern agriculture machinery and methods are not used. Most crops raised in the country are grown for the domestic market, but some dried fruits, coffee, rubber, cinchona, cacao, and nuts are exported, as are some cattle and cattle products.

Lack of cheap power and coal has limited development of industry in Bolivia. What little manufacturing there is, is centered in the Department of La Paz. Industries include processing of foodstuffs and beverages, textiles, furniture, tobacco, glassware, and chemical products.

**Foreign Trade.** Bolivian exports usually exceed imports. Since Bolivia has no seacoast, all foreign trade is conducted through Argentina, Chile, or Peru, which grant special privileges to Bolivian commodities. In 1944, exports totaled \$77,553,968, of which the value of tin amounted to \$53,112,692. In that year the United States received \$48,957,723 of the total exports; the United Kingdom, \$26,206,383; Argentina, \$1,884,920.

Bolivian imports consist chiefly of manufactured products. In 1944, imports totaled \$42,076,334. Manufactured articles represented 52 percent of the total; foodstuffs and beverages about 27 percent; raw materials some 14 percent. Of total im-

ports for that year the United States provided 33 percent; Argentina, 27 percent; Peru, 15 percent; Chile and the United Kingdom each supplied about 7.5 percent.

JOSEPH P. BLANK.

**BONIN ISLANDS (Ogasawara Gunto).** An archipelago of 27 islands in the western Pacific, about 550 miles south of Tokyo, Japan. The chief islands are Chichi (10 sq. mi.), Haha, Ani, Ototo, Mei, Yome, Muko, and Nakadachi. Total area: 30 square miles. Population: 6,000 in 1940. Capital: Omura (on Chichi). The principal agricultural crops are sugarcane, pineapples, and bananas. The Bonins passed to the control of United States forces following the surrender of Japan to the Allied nations in 1945.

**BOWLING.** The fastest growing sport of the past decade showed no signs of a slump in 1946 and despite the lack of materials for new alleys, which would permit even faster gains, bowling continued to add to its legions of followers. The American Bowling Congress championship, a war casualty since 1942, was revived last year and the big show kept Buffalo's Seventy-fourth Regiment Armory humming with activity for 62 days.

Our 1945 match game champion, Joe Wilman of Chicago, captured the important all-events crown with a gross score of 2,054, but Leo Rollick of Santa Monica, California, proved the individual star of the meet. Rollick tallied 737 for singles laurels and placed second to Wilman in the all-events with 2,052, only two pins separating the men. The coast ace also helped the Llo-DaMar Bowl keggers win five-man team honors with its total of 3,023 and added to his bag of prizes by rolling the first and only 300 game of the tourney. The doubles title went to the Buffalo team of John Gworek and Henry Kmiodowski, who posted 1,360 on the last day of the long tournament.

Andy Varipapa of Hempstead, L.I., captured the U.S. match game championship for 1946.

THOMAS V. HANEY.

**BOXING.** The turnstiles sang a merry tune for fight promoters in 1946 for the champions of prewar days returned to the ring to put their titles on the line and provide just the impetus needed to restore boxing to the ranks of big business.

The first heavyweight championship in four years proved unique in that the admission price soared to \$100 a ticket for the first time in history—which was a good indication that a new lush era for sports was definitely here. To be sure, the battle was not worth it for Billy Conn, the Pittsburgher who almost dethroned Joe Louis in their first meeting, was no match for the Shuffler in their long-heralded return go at the Yankee Stadium.

A badly scared Conn just ran away from Louis for seven rounds, then Joe tagged him with the same lethal punch that has been the undoing of so many challengers. The fight pooled \$1,925,564, plus radio, picture, and television rights that sent the total over the two-million mark.

The financial success of that fiasco apparently called for a retake and before the summer was over Louis had made another successful defense of his crown by knocking out Tami Mauriello in one round. That bout provided one of boxing's biggest thrills of the year, for the Bronx Fighter opened the battle with a "sneak" punch that sent Joe staggering across the ring and threw a scare into the fans. However, Louis—real champion that he is—recovered quickly to knock out his shorter foe. As the year ended there was not a heavyweight in

sight who might prove a dangerous threat to Gentleman Joe.

Sometime during 1946 every titleholder but one defended his crown at least once. The lone exception was Freddie Cochrane, who took the welterweight laurels in 1941 and lost the title in the past year to Marty Servo. Servo, plagued by injuries, was forced to retire from the ring before another fight whereupon Ray Robinson, long recognized as the "uncrowned champion," officially gained the diadem by outpointing young Tommy Bell late in December.

Cus Lesnevich, light heavyweight king, stopped Freddie Mills in a London bout that paid \$176,000; Tony Zale, middleweight ruler, knocked out Rocky Graziano, wartime sensation, in six rounds; Willie Pep halted Sal Bartolo to merge the National Boxing Association and New York State featherweight recognition into one undisputed championship; Manuel Ortiz, bantam king, beat three challengers; and Jackie Paterson, flyweight from Scotland, defended once.

The lightweight title was still split as Bob Montgomery kayoed Allie Stolz and Wes Mouzon to retain recognition as champion in New York State, while Ike Williams knocked out Ronnie James, British king, at Cardiff, Wales, to keep the crown as seen through the eyes of the N.B.A.

Zale, the Gary, Indiana, whirlwind, furnished the biggest thrill of the year in his slugfest with Graziano in which the two gladiators took turns pulverizing each other before the champion, groggy and gory, got up from the floor twice to finally halt Rocky with a right to the body. Tony was the unanimous choice of boxing writers for the Edward J. Neil Memorial Trophy for the year's outstanding contribution to the sport. At the same time the ailing Mike Jacobs, promoter, was voted an award for outstanding service over a period of years.

A team from Hawaii and one from the U.S.M.C. Cherry Point, N.C., tied for team honors in the National A.A.U. championships held April 7-10, 1946. The U.S. Military Academy won the twenty-third annual Intercollegiate Association tournament, March 9, 1946.

THOMAS V. HANEY.

**BRAZIL.** A republic of South America. Area: 3,286,170 square miles. Population (1944): 45,300,000. Capital: Rio de Janeiro.

Brazil is the largest country in South America and the fourth largest in the world. Over half of its total surface is composed of a plateau of 1,000 to 3,000 feet elevation. More than two-fifths of the country consists of the Amazon and part of the Plata lowlands. The lowlands and eastern coastal plain are tropical; most of the plateau region is sub-tropical; the southeast is temperate in climate.

**Population.** Nearly one-half of the total population of South America lives in Brazil. It is estimated that about 60 percent of the people are of European origin (chiefly Portuguese, Italian and German); 30 percent are of mixed blood (white, Negro, and Indian); 8 percent are Negro, and 2 percent Indian. The foreign population consists mostly of Italians, Portuguese, Spanish, Germans, and Japanese, and is largely concentrated in the south and southeastern sections of the country. The number of persons per square mile ranges from 0.7 in the state of Amazonas to 114 in the state of Rio de Janeiro.

The three largest cities are: Rio de Janeiro, 1,780,000; São Paulo, 1,315,000; and Recife, 350,000. The official language of Brazil is Portuguese, but

Italian and German are spoken in some sections of the southern states.

The predominant religion is Roman Catholic.

It was estimated in 1942 that about 50 percent of the adult population is literate. In 1941 there were 42,794 primary schools with a total enrollment of 3,350,737 students; 4,572 secondary schools with a total student body of 419,674; 4 universities and 57 separate faculties and institutes with a total registration of 21,098 students.

**Government.** Brazil is a federal union of 20 states and five border territories. Getulio Dornelles Vargas became President by a coup d'etat in October 1930. In 1937 Vargas dissolved the Congress and assumed direct control of the government. A new Constitution was drawn up in 1937 which was never made effective. Under a decree issued in 1939, the national government assumed virtually complete control over state governments. President Vargas resigned in October, 1945. Supreme Court Chief Justice José Linhares became acting chief executive pending elections, which were held on Dec. 2. President: General Enrico Gaspar Dutra.

**Events, 1946.** Brazil ushered in the year on January 31, with the Presidential inauguration of Maj. Gen. Enrico Gaspar Dutra, the first Chief Executive elected by a popular vote in a direct election. The election in December 1945 followed a coup earlier in October that unseated Gen. Getulio Vargas, so-called dictator of South America's largest state since 1930.

Although President Dutra's inaugural speech stressed promises of democratic reforms in the fields of education, finance, cost of living, industry, and international relations, there was some doubt concerning the actual results after the new regime was formally entrenched. Vargas, who was elected to Congress from his home state of Rio Grande do Sul and who still controlled a powerful political machine, openly supported Dutra. Despite this support, President Dutra was in position to make independent decisions, since he held the unqualified support of the army which overthrew Vargas.

The Cabinet chosen by President Dutra consisted of the following: João Neves da Fontoura, Foreign Affairs; João Liuz, Justice; Gastão Vidigal, Finance; Col. Edmundo Soares, Communications; Netto Campello, Agriculture; Octacilio Lima, Labor; Gen. Pedro de Goes Monteiro, War; Vice Admiral Dodsworth Martins, Navy; Brig. Gen. Armando Trompowski, Air. None of the military men belonged to any political party, except Lima who was affiliated with the Labor party led by Vargas.

On February 19, Brazil followed the line of the United States' *Blue Book* accusations of Axis influence in Argentina which contained charges against Eduardo Aunos, recently appointed Spanish Ambassador to Brazil. The United States report mentioned Aunos as a member of a Spanish commercial mission in Buenos Aires which attempted to ship German arms into Argentina via Spain. Brazil refused to receive Aunos. Although he was en route to Rio de Janeiro, the Government persuaded him to land at Trinidad. Foreign Minister Fontoura explained that Aunos was accepted previously by the Linhares government, the interim regime between Getulio Vargas and Enrico Dutra, which had little information on the case. However, Fontoura pointed out, relations between Brazil and Spain were most friendly; the move was prompted by Brazil's hemisphere policy which was the backbone of her foreign policy.

Despite this acceptance of part of the United States' *Blue Book* accusations of Argentina-condoned Nazi activities, Foreign Minister Fontoura

on April 4 issued a memorandum stating that Brazil would continue friendly relations with Argentina. The statement was in effect a reply to the *Blue Book* transmitted to Brazil on February 12. The *Blue Book* charged that Argentina's President-elect, Juan D. Perón, had manifested Nazi sympathies.

Fontoura stated that the *Blue Book* exposed the need for prudent vigilance, but that the Brazilian Government did not believe that the Nazi doctrines would find a welcome haven in the Western Hemisphere. The reply further declared that Brazil had no desire to exclude Argentina from any hemispheric mutual defense treaty.

The factors capable of disrupting the stability of the newly-established Dutra regime were the problems of inflation, disparity in wages, and poor living conditions among the low income population all coupled with the flourishing growth of the Communist party. Led by Luiz Carlos Prestes, one-time Brazilian army captain, the Communist Party in the December, 1945 election polled 568,000 votes (ten percent of the total), elected fourteen deputies and its leader to the Senate and emerged as the fourth strongest party in Brazil.

During the Vargas dictatorship in 1935, Prestes was imprisoned for nine years after sparking an abortive revolt, and the Communist party was outlawed. Shortly before the election in 1945, Vargas released Prestes and legalized the Communist Party.

Fear of the Communist strength forced Dutra to resort to repressive measures in a campaign to reduce the potency of the Communist Party. Foreign Minister Fontoura, in an interview which he later denied categorically, inadvertently embarrassed his Government by declaring that the United States should diplomatically shake hands with Argentina (since Argentina was anti-Communist) and strive to build a hemispheric wall against the Soviet Union.

On the day of this statement, May 13, the arrival of Envoy Jacob Suritz, Russia's first Ambassador to Brazil in 29 years, was greeted by a cheering crowd of Communists.

Suritz's arrival was not timed too propitiously. In the early April, as the Government was groping about for a means to smash the Communist strength, leader Prestes made a political faux pas by declaring that the Brazilian Communists would fight against their own country if it "eventually became involved in imperialist war against Russia." Reaction was swift and began with Congress immediately discussing plans for outlawing the Communist Party. Prestes replied by declaring that the United States was engaged in an imperialistic plot to foment war between Brazil and Argentina.

During May the Government started purging its offices of any personnel linked to the Communist Party. At Pernambuco, police prohibited outdoor Communist meetings on the grounds that speeches were inciting people to civil war. On the day before Suritz's arrival, troops were landed at the strike-bound coffee center of Santos. This followed the closing of the stevedores syndicate by the Labor Ministry, which had employed police to force the dock workers to unload Spanish ships. The workers returned to work after Minister of Labor Octacilio Negrão de Lima promised a 54 percent pay raise and replacement of disreputable tenements with modern housing.

A week later workers on the Leopoldina railroad struck, crippling food supply and transportation to the important state of Minas Gerais. The Government immediately assumed operation of the railway. Both major strikes were fostered by Com-

munist, the government claimed, and directed against privately owned companies.

The Cabinet grew more worried and on May 15 it approved a national anti-Communist program nebulously aimed to "defend democracy and the Christian traditions of the Brazilian people." The campaign was publicized on a broad newspaper and radio front. Tension mounted on May 23 when the police used gunfire to disperse an outdoor Communist meeting in Rio de Janeiro and on the following day, the Government issued a drastic decree prohibiting Communist meetings anywhere in Brazil. The Government next turned in the direction of Prestes and ruled that, despite the general amnesty given to political prisoners, the Communist leader was not eligible for reinstatement in the army.

The Communists replied with another strike in Santos on May 27. The situations grew more acute on June 1 when workers of the Rio de Janeiro tramway, light, and power company voted to strike for higher wages. Police met the threat by seizing Communists and three labor union headquarters in Rio de Janeiro. Communist leaders denounced the seizure as an "attempt on the free functioning of legally registered parties." In late July, President Dutra tightened the clamp by a decree forbidding organized labor to engage in any political activity or engage in "propaganda for doctrines that are incompatible with the national institutions and interests."

After a brief sojourn following the elections, ex-President Vargas returned to the political scene in Rio de Janeiro early in June. Full fanfare heralded his return as advertisements were printed in newspapers inviting his followers to welcome him. His induction to the Senate, however, was greeted by UDN (*União Democrática Nacional*) minority leader Octavio Mangabeira requesting a vote of appreciation to the army for evicting Vargas.

One of Brazil's more flamboyant and profitable businesses, gambling, was suddenly outlawed in April by government decree. In Rio de Janeiro alone, this order put 70,000 people out of work and deprived the city of \$2,000,000 in annual revenue. However, horse racing and national lottery, which ranked in revenue just behind the casinos, were unaffected.

The combination of a rising cost of living, estimated to have increased 300 percent since 1944, a growing black market, and hunger among the population on the lowest economic level created a tension that finally snapped in a major riot in Rio de Janeiro on August 31. President Dutra attempted to alleviate the distress on August 21 by exempting thirty-three food products and soap from all customs duties and business taxes. He followed this up with an embargo imposed on all food stuffs, hides, and lumber in the hope of increasing the supply of consumer goods.

Crowds gathered in the streets of Rio de Janeiro and São Paulo on August 30 formed into marching bands and shouted "Death to black marketers." As the crowds moved through Rio de Janeiro attacking high-priced movies, restaurants, and shops, shock police and troops were called into the city to quell disorders.

The Brazilian Congress held one of the stormiest sessions in its history on the next day. Heated debates and fistcuffs accompanied the inquiry into the riot. The chief of the federal police, Joe Pereira Lira, said that the Communist party was preparing for revolution and attributed the riot to agitators who took advantage of student activities against high prices. During the height of the disorder

Communist Deputy Trifino Correia was arrested, but released on the day of the Congressional session. President Dutra sought to avert a further crisis by ordering a moratorium of 180 days on payment of bills by all producers of livestock. On September 1 martial law was declared in Rio de Janeiro and maintenance of order was placed in the hands of the military authority. Police guards were removed from the Communist headquarters which had been occupied on the previous day. When the riot died out in the first days of September, the casualty list reached one dead and a hundred injured.

The Brazilian Constituent Assembly ratified on September 17 a new Constitution which returned the country to representative government and ended six years of rule by decree. Replacing the "New State" charter adopted by President Vargas in 1937, the new Constitution deprived the President of his power as "supreme authority of the state" and introduced a two-house Congress. Although the President retained wide power and held the right of veto, a two-thirds majority in Congress could override him. The President was permitted to initiate legislation and, with the consent of Congress, call a state of siege.

Provisions in the charter touched on various aspects of Brazil's social, economic, and political life. While greatly freeing the economy, the government provided for emergency economic measures by retaining "the faculty to interfere in the economic domain and to monopolize a determined industry or economic activity. . . . Such intervention shall be based on the public interest and limited by the fundamental rights guaranteed under this Constitution."

Strong powers were given the Government in the political field where it could outlaw any political party whose program of action was contrary to a "democratic regime based in the plurality of parties and in the guarantee of fundamental human rights." Other provisions restored full powers to the States under the Federal United States of Brazil, set up an independent judiciary, granted the vote to all citizens over eighteen years old and guaranteed the freedom of speech, assembly, religion, and press. Censorship was prohibited and the right of habeas corpus action was guaranteed all Brazilians.

In the social security field, the Constitution outlined extensive provisions for pensions, unemployment insurance, hospitalization, an eight-hour day, annual vacations, a weekly day of rest, indemnification for dismissal, minimum wages without discrimination, security of tenure after ten years and recognition of labor's right to strike.

With the adoption of the Constitution, the Constituent Assembly changed into an ordinary Congress. Earlier in the month all Cabinet members resigned to give President Dutra a free hand in selecting a new Cabinet. On September 19 the Congress elected Senator Nereu Ramos to the Vice-Presidency. By October 17 the following Cabinet members were appointed: Justice, Benedicto Costa Neto; War, Maj. Gen. Pereira da Costa; Agriculture, Daniel de Carvalho; Communications, Clovis Pestana. On November 14 the Government announced that Raul Fernandes, Brazilian representative to the Paris Peace Conference, would be appointed Minister of the Exterior. Within a few weeks the Cabinet also included Moran Dins de Figueiredo, Labor; Luiz Correia e Castro, Finance; and Admiral Sylvio Noronha, Navy.

Senator Getulio Vargas, who avoided signing the new Constitution, signalled his return to active

politics on November 30 by a speech attacking the Government of President Dutra. Before a rally of the Labor party, Vargas asserted that democracy was on the decline and championed the cause of a Socialist democracy. He accused the Dutra Administration of piling up a large debt and depriving Brazilians of several democratic rights.

In early December, Finance Minister Luiz Correia e Castro announced plans for the reorganization of Brazil's banking system. Basing the reorganization on the pattern of the Federal Reserve System of the United States, Minister Correia e Castro said he would ask Congress for authority to create a Banco Central to coordinate the activities of the seven other specialized banks. If the reorganization plan received approval, the Government Banco do Brasil, which handled all types of banking transactions, would become a simple deposit and discount bank. The plan would establish special banks for mortgages, rural credit, industrial financing, export and import, investments and re-insurance.

Brazil's dream of heavy industry development was primed, late in June, by the first steel ingots rolling off the production line of the \$90,000,000 Volta Redonda steel mills south of Rio de Janeiro. The mills were financed by a \$45,000,000 credit from the United States Export Import Bank and an equal amount purchased by the Brazilian stockholders and the Brazilian Government. Volta Redonda was capable of producing 300,000 tons a year, and further plants were planned to bring production to an annual 1,000,000 tons.

Construction of 1,000 rural schools in the interior of Brazil was announced in August by Education Minister Caunpos. A budget of 66,000,000 cruzeiros was set aside for the program in 1946, with a large appropriation expected for 1947. The new Constitution carried a provision by which the Federal Government must devote 10 percent and the state and municipal authorities 20 percent of their income to the promotion of education.

**Relations with the United States.** Commercially, the war-strengthened ties between the United States and Brazil held fast, but ideologically they weakened before a strong resurgence of nationalism. At the end of 1945, the presence of United States sailors was cause for city-wide riots in São Paulo, sponsored, it was believed, by agents provocateurs. Communists played on the theme of ridding the country of United States money and personnel, classified as the forerunners of imperialism.

Much of the United States goodwill in Brazil was stimulated by United States Ambassador Adolf A. Berle, Jr., who did much to encourage Brazil's economic development, especially in the field of aeronautics. Ambassador Berle arranged for the sale of 24 army transport planes that served to enlarge the existing limited air service. In early July, the United States extended \$8,000,000 of credit to Brazil to purchase surplus property in that country including plane parts and small boats.

**International Relations.** As a member of the United Nations Security Council subcommittee, Brazil was last to agree on the recommendation that the question of Spain be submitted to the General Assembly if General Francisco Franco was still in power in September. The decision was unanimous when Dr. Pedro Velloso, appointed to the United Nations on March 7, withdrew his reservation.

In the International Monetary Fund organization, Brazil was the first nation to take steps to eliminate the multiple foreign-exchange rates for its currency, the cruzeiro. The action, taken in April, established one value for sale and purchase

of Brazil's exchange for foreign trade purposes, which averaged the two rates which existed before. Under the old system exporters were required to sell 20 percent of their foreign exchange receipts at a special premium to the Bank of Brazil. While the Government was making about 14½ percent out of such transactions, the single exchange rate eliminated the profit. A 3 percent tax on exports was continued.

On September 17 the United States and Brazil signed a bilateral air agreement dealing with all phases of commercial aviation operations. The agreement granted an American airline free and unlimited access to the "cut-off" route via Baurias, between Balem and Rio de Janeiro and permitted Brazilian airlines to fly to New York. The Parnamirim airbase, largest in Brazil and used by the Allies during the war, was returned to Brazil by the United States on October 5. During the war the base handled an average of 800 planes a day.

Great Britain and Brazil concluded a major trade agreement on September 19 under which Brazil will spend approximately \$200,000,000 in blocked sterling on British machinery and equipment. In addition to the Brazilian purchases, the pact laid down principles for the reorganization of certain British railways and utility companies in Brazil, for the increase of British purchases in Brazil and for future discussions on a new civil aviation agreement.

On October 23 a five-year barter pact was negotiated between Brazil and Argentina which provided Brazil with Argentine wheat in exchange for crude and manufactured rubber, cotton, textiles and yarn, lumber and pig iron. Effective January 1, 1947, the agreement committed Argentina to supply Brazil with annual shipments of 1,000,000 tons of wheat, providing the exportable surplus is not less than 2,600,000 tons. If the surplus is less, Brazil will receive 45 percent of the surplus. Brazil promised to send Argentina its entire exportable surplus of tires, 3,000 tons of crude rubber in 1947 and 5,000 tons in each of the succeeding four years, 60,000,000 yards of cotton textiles in 1947 with increased shipments during the succeeding years, a billion square feet of lumber over the five-year span and an annual minimum of 15,000 tons of pig iron.

The die-hard elements of the Japanese population in Brazil, who never admitted that Japan was defeated, engaged in terroristic activities against those Japanese who faced the war's end realistically. Several prominent Japanese were murdered by the terroristic Shinto Rommei society. Reputed to have a membership of 130,000, the society was engaged in espionage activities during the war and had planned to bomb the Panama Canal shortly after Pearl Harbor. In April the police began rounding up the terrorists on charges of intimidating their fellow countrymen. The efforts of the police to stamp out the secret society only succeeded in increasing the gang's activities. A scheduled wave of assassinations on August 15 was broken up in a gun battle after which President Dutra ordered the deportation of 27 leading terrorists from São Paulo State.

**National Economy.** Agriculture constitutes the basis of Brazilian economy. It is estimated that over three-fourths of the total population derives its income directly from agriculture. Livestock and livestock products rank first in domestic importance, while coffee and cotton lead all other agricultural crops in foreign trade. Brazil now ranks fourth among cattle-raising nations of the world with some 42,000,000 head. In 1940 there were

over 6,000,000 goats; more than 25,000,000 swine; and about 15,000,000 sheep.

The most valuable agricultural crops are coffee, cotton, and corn. The country produces about one-half of the world's output of coffee; ranks third among world producers of corn; and leads the countries of the Western Hemisphere in production of rice. Other important agricultural crops include: sugar, manioc, beans, citrus fruits, bananas and other fruits, tobacco, wheat, oil-bearing seeds and nuts, and cacao. Intensive efforts are being made to increase the country's output of rubber. Brazil produced 9,400,000 bags (of 60 kilograms) of coffee in 1944; 470,000 metric tons of cotton in 1943-44; 1,790,000 metric tons of rice in 1944; 1,300,000 metric tons of sugar in 1943-44; 1,998,887 bags (of 60 kilograms) of cacao in 1943; and 76,762,473 bunches of bananas in 1942. For the past 10 years Brazil's annual corn crop has averaged about 5,500,000 metric tons.

Brazilian industry has been developing rapidly since 1900. In 1940 Brazil had 52,379 manufacturing plants; by 1943 the number had grown to 100,000, employing 1,500,000 workers; São Paulo is the leading industrial state. In 1943 the most important manufactures were: foodstuffs, comprising about 32 percent; textiles, 19.8 percent; clothing and toilet goods, 7 percent; chemicals, 6.7 percent. It is estimated that the total value of Brazilian industrial production reached more than 31,000,000,000 cruzeiros in 1943. Sericulture, with an annual production in 1944 of 300,000 kilograms of silk yarn, representing a gain of nearly 400 percent in four years' time, is a growing industry.

**Foreign Trade.** Brazil's foreign trade reached a high record in 1944. Exports totaled 10,711,338,000 cruzeiros, 80 percent of which was agricultural, livestock, and forest products. The largest single export item was coffee beans, valued at 3,879,343,000 cruzeiros. Cotton piece goods valued at 1,046,193,000 cruzeiros ranked second, and raw cotton valued at 667,941,000 cruzeiros, third. Rubber exports in 1944 totaled 365,389,000 cruzeiros, an increase of 135 percent over 1943, though exports of tires and tubes decreased. During 1944 Brazil exported 107,640 tons of raw cotton; 13,555,484 bags of coffee; 25,805 tons of preserved beef; 15,860 tons of other preserved meats; 24,253 tons of hides and skins; 298,000 metric tons of pine; 110,146 metric tons of cacao beans, and cocoa butter; and 48,692 metric tons of maté.

The total value of Brazilian imports for 1944 amounted to 7,885,836,000 cruzeiros, an increase of 29 percent over 1943. Foodstuffs, valued at 1,687,835,000 cruzeiros, made up the largest group of imports, of which wheat was the leading item. Manufactured iron and steel products, valued at 551,697,000 cruzeiros, ranked second. Imports of scientific instruments and accessories increased over 69 percent; imports of cutlery, tools, and utensils more than trebled.

Ninety-three percent of Brazil's total imports in 1944 came from the American republics, which took 76 percent of Brazil's exports. The United States took 53 percent of Brazilian exports, and provided 61 percent of its imports. Argentina was the principal South American customer, taking 13 percent of Brazil's exports and furnishing 21 percent of its total imports.

JOSEPH P. BLANK.

**BRENNAN, German Baptist (Dunkers or Dunkards).** A religious organization founded in Schwarzenau, Germany, in 1708 by a group of Pietists, led by Alexander Mack, and established in Germantown,

Pennsylvania, in 1719 under the leadership of Peter Becker. There are four denominations of Brethren in the United States, the largest and oldest group being the Church of the Brethren, with headquarters at 22 South State St., Elgin, Illinois.

**BRIDGES.** It is an ill wind that blows nobody good, and the winds that destroyed the suspension bridge at Tacoma, Washington, and the truss bridge over the Mississippi at Chester, Illinois, have had the good effect of starting a comprehensive study of aerodynamics or wind effects on long-span bridges in general and suspension bridges in particular. On rigid-truss structures the effects must be in sheer power of the wind to lift or overturn the bridge. But with the flexibility of a suspension bridge a comparatively light wind may set up cumulative vertical waves and lateral swaying that may culminate in vibration movements of serious or destructive force. The investigations included laboratory tests with models in wind tunnels, supplemented by instruments placed on the Golden Gate suspension bridge at San Francisco to record actual movements and stresses. Plans for the new Tacoma bridge, of 2,800 ft. span, have been adopted and construction is expected to start in 1947.

As to other suspension bridges, a report on the Brooklyn Bridge shows it to be in good condition, needing only some strengthening of the trusses on account of the heavy motor truck traffic. The George Washington Bridge, over the Hudson at New York, built in 1931, has two three-lane roadways, separated by an open space which is now being paved to make a total of eight lanes.

In a bridge built by the U.S. Army at West Point, N.Y., the stiffening of the 460-ft. span is effected by cables leading from the suspension cables to the chords of the floor framing. Traffic on the  $12\frac{1}{2}$ -mile suspension and cantilever bridge across San Francisco Bay is so heavy that already plans are being discussed for a second bridge. Wire cables of a 240-ft. suspension bridge built in 1856 over the Feather River in California were found in good condition in 1946.

There are several projects for bridges across the Mississippi, but most of them are in the early stages and the present financial conditions are not favorable for construction. The piers for the Memphis bridge are built, but the superstructure is delayed by the high cost of steel. At the Chain-of-Rocks, north of St. Louis, the course of the river is being diverted by a canal which is to be spanned by a bridge having a truss span of 465 feet over the channel. Other projects are at New Orleans, La.; Helena, Ark.; Carruthersville, Tenn.; Cape Girardeau, Mo.; East St. Louis, Ill.; and the reconstruction of the wrecked bridge at Chester, Ill.

The most serious bridge accident of the year was the wrecking of 300 feet of the two-mile, high-level Cooper River bridge at Charleston, S.C., by a steamer which dragged its moorings in a storm and drifted against one of the steel piers. The bridge had been purchased by the State and was to have been freed of tolls in July. An emergency ferry service was provided by the U.S. Navy until the State Highway Department built a temporary span of the Bailey military type, the new permanent structure being opened in June. Another Bailey bridge was built over the Patoka River near Jasper, Ind., when an old 114-ft. span was wrecked by a skidding motor truck.

To relieve congestion of street traffic at Washington, D.C., two four-lane bridges across the Potomac have been authorized by Congress in

preference to one very wide bridge. A bridge, 8,000 ft. long, with viaduct approaches, is planned to cross the Allegheny between Kensington and Tarentum, Pa. The highest bridge in Kentucky, 250 feet above the Kentucky River at Cleveland, Ky., was opened on August 17. Of movable bridges, the New York Central R.R. plans to replace the old swing bridge over the Harlem River by a vertical-lift bridge of 225-ft. span, to have a headroom of 25 feet when lowered and of 135 feet when raised for navigation. Chicago has the distinction of possessing 56 movable bridges, more than any other city. They include trunnion bascules, rolling bascules, vertical-lift, and horizontal swing bridges, and there have also been temporary pontoon spans.

An example of the utilization of old structures is the bridge over the Colorado River at Topock, Arizona. Abandoned by the railroad in 1945 when a new bridge was built, it has been converted into a highway bridge by putting in a steel floor-framing to carry a 20-foot concrete slab.

Skewed bridges, crossing roads or railways at a flat angle, are often difficult to design and costly to build, owing to obstacles in placing the supports and in adjusting the lengths of the several spans. In several cases the solution has been to support the spans on a single line of columns, each column having a T-head wide enough to carry lines of girders for a deck slab or floor. For such a structure crossing a highway and two railroads the columns were  $6\frac{1}{2} \times 3$  ft. in section, with heads 30 ft. wide. This peculiar design has been applied to railroad and highway bridges of both steel and concrete. An experimental novelty is a 100-ft. plate-girder span built entirely of aluminum alloy, even to the rivets, at Marion, N.Y. It weighed 53,000 lb., as compared with 128,000 lb. for identical steel spans in the same bridge.

A 10-mile causeway or embankment with an 800-foot channel span 145 feet above the water is planned by the Port Authority of St. Petersburg, Florida, across Tampa Bay southeast to Bradentown, and has been approved by the War Department. Several highway toll bridges have been approved by Congress, but in State highway departments the trend is to purchase or otherwise exempt bridges from tolls. West Virginia, for example, has freed three toll bridges in 1946.

In many States bridges were wrecked by floods in 1946. The failure of a bridge across the Manasquan River, near Brielle, N.J., is attributed to the dredging of the channel, thus exposing the wood piles to the attacks of teredos. Fire damage to the Ottawa River bridge at Ottawa, Canada, on March 29, is credited to the too-frequent cigarette.

Throughout Europe, bridge repairs and reconstruction are major items in post-war engineering. Military or sectional bridges are being used extensively for speed of construction, either as a complete structure or to span wrecked gaps. In France, of nearly 6,000 highway bridges destroyed or seriously damaged, 4,000 had been permanently rebuilt by October, 1946; and of 2,603 railway bridges, 1,065 has been permanently rebuilt and most of the others given temporary repairs. A curious feature of a welded steel bridge in spans of 100 feet and 48 feet over the Seine at St. Cloud, is the facing of the outer girders with copper sheets 10 feet deep. Another welded steel bridge crosses the Seine at Neuilly in spans of 269 feet and 219 feet.

The wrecked Rhine bridge at Dusseldorf was replaced by a suspension bridge having four spans of 312 feet, designed by an American engineer. At Cologne, the "Patton" bridge, opened on June 12,

has eleven spans of 120 feet and a draw span for navigation, using the Bailey type of construction for both piers and spans. Denmark has completed the Alexandrine bridge, having a steel arch span of 390 feet. On June 15, the kings of Norway and Sweden formally opened the international Swinesund highway bridge over the Idelfjord River, near Oslo, having a concrete arch of 570-foot span. Other long-span concrete arches are: Plougastel, France, 580 feet, in 1930; Traneborg, Sweden, 592 feet, in 1934; Esla, Spain, 672 feet, in 1942; Sando, Sweden, 886 feet, in 1943; Zurich, Switzerland, 442 feet, in 1946.

In England, ambitious bridge projects include a suspension bridge over the Severn, with a main span of 3,000 feet and two side spans of 1,000 feet, the entire length of bridge to be about eight miles. Other proposed suspension bridges include spans of 1,000 feet or more over the Humber and over Milford Haven. In Australia, the new railroad bridge over the Hawkesbury River was opened on July 1. It has two truss spans of 446 feet, four of 348 feet, and two of 147 feet. It supersedes the older similar bridge, two hundred feet downstream, which was built by American engineers in 1889, but which had become too weak for modern locomotives and traffic, and had also shown defects in the foundations. Canada converted a lift bridge at Winnipeg into a fixed structure, since there is now no navigation on the Assiniboine River. Another Canadian project is a St. Lawrence bridge between Prescott, Ontario, and Ogdensburg, N.Y. A causeway is proposed between Nova Scotia and Prince Edward Island.

\* Estimates for 1944 except for Zanzibar (1931).

In 1945 a British Government *White Paper* proposed a central legislature for the three territories and an executive organization with advisory boards dealing with questions of common concern. The area and population of the territories is shown in the accompanying table.

**BRITISH EMPIRE.** The world's largest empire, comprising an area of 14,435,000 square miles and a population of about 539,870,000. It consists of:

1. The United Kingdom of Great Britain and Northern Ireland. See GREAT BRITAIN; IRELAND, NORTHERN.

2. Self-governing Dominions—AUSTRALIA, CANADA, NEW ZEALAND, UNION OF SOUTH AFRICA.

3. NEWFOUNDLAND, a dominion whose constitution was suspended in 1933 and whose government is carried on by a Commission of Government responsible to the Government of the United Kingdom.

4. EIRE (IRELAND), a sovereign, independent state associated for certain purposes with the United Kingdom and the self-governing dominions, the group defined constitutionally at the 1926 Imperial Conference, as confirmed by the Statute of Westminster, 1931, as the British Commonwealth of Nations.

5. INDIA and BURMA, in transition to self-government.

6. Self-governing colonies—CEYLON and SOUTHERN RHODESIA.

7. Crown colonies and protectorates—ADEN, BAHAMAS, BARBADOS, BASUTOLAND, BECHUANALAND, BERMUDA, BRITISH GUIANA, British Honduras, BRITISH NORTH BORNEO, BRITISH SOLOMON ISLANDS, BRITISH SOMALILAND, BRUNEI, CYPRUS, FALKLAND ISLANDS, FIJI ISLANDS, GAMBIA, GIBRALTAR, Gilbert and Ellice Islands, GOLD COAST, HONG KONG, JAMAICA, KENYA, LEEWARD ISLANDS, MALTA, MAURITIUS, NIGERIA, NORTHERN RHODESIA, NYASALAND, Pitcairn Island, St. HELENA, SARAWAK, SEYCHELLES, SIERRA LEONE, STRAITS SETTLEMENTS, SWAZILAND, TONGA, TRINIDAD and TOBAGO, UGANDA, WINDWARD ISLANDS, ZANZIBAR.

8. Protectorates of a special nature—Federated Malay States, Unfederated Malay States, in transition to Malayan federation.

9. Mandates held by the United Kingdom—BRITISH CAMEROONS, PALESTINE, TANGANYIKA, TONGAND (British sphere).

10. Mandates held by Dominions—Nauru (administration by Australia), New Guinea (Australia), South-West Africa (Union of South Africa), Western Samoa (New Zealand).

11. Dependencies of Dominions—Labrador (Newfoundland); Ashmore and Cartier Islands, PAPUA, Norfolk Island, Australian Antarctic Territory (Australia); Union Islands or Tokelau and Ross Dependency (New Zealand).

12. Territories held under condominium—ANGLO-EGYPTIAN SUDAN (United Kingdom and Egypt); New HEBRIDES (United Kingdom and France); Canton and Enderbury Islands (United Kingdom and United States).

See the separate articles covering most of the above territories. Straits Settlements, Federated Malay States and Unfederated Malay States are dealt with under BRITISH MALAYA.

Before the Japanese occupation the chief city, Singapore (750,805), was one of the world's leading ports, as well as the principal British naval base and administrative center in the Far East. Malaya was conquered by the Japanese in 1941 and 1942. Singapore was re-entered on September 3, 1945, by Admiral Sir Arthur Power, Commander-in-Chief of the British East Indies fleet. The official surrender of Southeast Asia by the Japanese took place on September 12.

A union of the Malay States, a step frequently discussed in Britain before the Japanese surrender, was proposed in the British House of Commons on October 10, 1945. The whole of Malaya contained only three blocks of British territory: the settlements of Singapore, Penang (with Province Wellesley), and Malacca. The rest of the country was composed of the Federated States (Perak, Pahang, Selangor, and Negri Sembilan) and the Unfederated States (Johore, Perlis, Kedah, Kelantan, and Trengganu). Britain was pledged by treaty to uphold the position of the rulers of the respective states. The situation was complicated by the presence of large numbers of immigrants, including some 2,000,000 Chinese (almost equal to Malays in number) and approximately 750,000 Indians.

**Government.** Under the British administration, the Governor of the Straits Settlements also served as High Commissioner for the Federated and Unfederated Malay States and Brunei and as Agent for British North Borneo and Sarawak. The Straits Settlements constituted a crown colony which was administered by the Governor with the aid of executive and legislative councils. The other Malay States were all protectorates with varying degrees of British control. A British Resident advised the ruler in each of the Federated and Unfederated States.

After the return of the British to Malaya and the announcement of the plan for a Malayan Union the following appointments, dated January 29, 1946, were made: Governor-General of the Malayan Union and the Colony of Singapore, Malcolm MacDonald; Governor and Commander-in-Chief of the Malayan Union, Sir Edward Gent; Governor and Commander-in-Chief of Singapore, F. C. Gimson. For further developments in 1946 see below.

**Events, 1946.** A Government White Paper issued in London on January 22, 1946, proposed the re-grouping of the Straits Settlements and the Malay States to form two administrations, namely, the Colony of Singapore and the Malayan Union, which would comprise the nine Malaya States and the Settlements of Penang and Malacca. The Malayan Union and Singapore would have separate governors and executive and legislative councils and other advisory councils would be created within and among the States.

In the meantime the approval of the sultans of the States was being sought. The report of Sir Harold MacMichael, who from October, 1945, to January, 1946, had been on a mission to all the States to invite the cooperation of the rulers in the establishment of a Malayan Union, was issued as a White Paper on February 27. Sir Harold reported that he experienced difficulty with the sultans of only two States, both of whom eventually agreed to the proposal for union. His account mentioned the absence of racial tension on Malaya, in spite of the fear on the part of Malays lest they be gradually submerged by immigrant Chinese. In a British House of Commons debate on March 8 it appeared that there was some opinion, both on the part of Britons experienced in Malayan affairs and among the sultans, that the treaties by which the States had become protectorates were being abrogated by Britain, and that some of the sultans had been hurried by Sir Harold MacMichael into signing agreements which they did not fully understand.

On April 1 the Malayan Union was inaugurated and the administration handed over by the military to the civil authorities. At a meeting of protest on April 16 the sultans decided to ask the Malayan Government for facilities to send a delegation to London. The sultans abstained from attending the installation of Sir Edward Gent as Governor of the Malayan Union on April 1 and that of Malcolm MacDonald as Governor-General of the Malayan Union and Singapore on May 22.

**From Union to Federation.** An important change in the plans for Malaya was announced from Singapore on July 4, as the result of conferences between MacDonald and the Malayan rulers. A "Malayan Federation" was to be substituted for the "Malayan Union" and a "High Commissioner" for the "Governor." The term "Federation" was welcomed in Malaya because it avoided a break with the past and implied the preservation, at least in part, of the prewar constitutional basis by which each sultan was recognized as the sovereign ruler of his own state. Sir Edward Gent, first and last Governor of the Malayan Union, would become the first High Commissioner. Further discussion was planned of the proposed Malayan citizenship.

Towards the end of July a working committee of six Malays and five British officials was set up in Kuala Lumpur to discuss the alternative plan. Ultimately the United Malays' National Organization was represented on the committee. The thorny question of citizenship was settled by the committee by a formula which limited citizenship to those whose real home was in Malaya and who looked to

Malaya as the object of their loyalty. By the beginning of December the proposals were in the hands of the British Government in London.

The results of the working committee's deliberations were made public on December 24. The Federation idea was included as anticipated and citizenship was defined as birth or permanent residence in Malaya. The committee announced that it would open public hearings on January 28, 1947. Early opposition to the plans came from Chinese, Indians, and the "Pan-Malayan Council of Joint Action," which denounced the committee as unrepresentative of the people of Malaya.

**Economic Difficulties.** In 1946 Malaya was beset by inflated prices, food and cloth shortages, deteriorated plantations, flooded mines, and labor unrest. Food, especially rice, which Malaya customarily imports, was short throughout the peninsula and some hardship was experienced. Imports of wheat helped to maintain the diet above the danger level.

The cost of restoring rubber plantations and tin mines was high and dissatisfaction arose from the controlling of the prices of the products. Encouragement to rubber producers came at the beginning of October when an Anglo-American agreement was made for the purchase by the United States of 200,000 tons before the end of the year. The rubber trade was confident that Malaya could supply the whole amount without drawing on United Kingdom stocks. There was some disappointment in Malaya at the low price accepted by the British delegation in Washington.

**The People.** The declining proportion of Malays, which has showed no change in trend, caused great anxiety to the Malay population. They formed 51 percent of the population in 1911 and only 42 percent in 1941. In the same period the Chinese rose from 33 percent to almost the proportion shown by the Malays. The percentage of Indians rose slowly but perceptibly from the eleven percent shown in 1911. The great centers of alien population were in the Straits Settlements, but Chinese outnumbered Malays in the Federated States as well. In the Unfederated States Chinese were in the minority.

The Chinese, and to a lesser extent the Indians, had control of the country's trade, industry, and professions. Many Chinese businesses forbade the employment of Malay labor. The Chinese and Indians had their own schools and maintained a far larger educated class than the Malays. The Malays, who belonged to the peasantry, were pushed back from the more desirable lands and were in general at the mercy of the traders.

In the discussion of the common citizenship question, it was clear that politically conscious Malays were prepared to make trouble if their sentiments were ignored and state lines eliminated. The Federation plan represented an attempt to take cognizance of these difficulties and at the same time to give Chinese and Indians a voice in the affairs of the country. A further complication was the fact that the religion of Malaya is Mohammedanism, to which few Chinese adhere.

ALZADA COMSTOCK.

**BRITISH NORTH BORNEO.** The northern part of the Island of Borneo. Until 1946 the territory was a protected state administered by the British North Borneo Company. Area, 29,500 square miles. Population (1931 census) 270,223. Chief town, Sandakan (13,723). In 1946 the administration of the territory was put under the Colonial Office. Arrangements were made to compensate the British North Borneo Company and to provide money from the Colonial Development and Welfare Fund for

special development schemes. Edward F. Twinning, formerly administrator of St. Lucia, Windward Islands, was appointed governor and Commander in Chief.

The chief products are rubber, timber, copra and coconuts, fish, tobacco and other crops. Exports of these products pass chiefly through Singapore and Hong Kong and are destined mainly for Empire countries.

**BRITISH SOLOMON ISLANDS.** A large group of islands under British protection, lying in the Pacific east of New Guinea. The largest is Guadalcanal (estimated 2,500 square miles) and the most populous is Malaita, with an estimated population of 40,000. The total land area is estimated at 12,400 square miles and the area within the bounds of the protectorate at 375,000 nautical miles. The 1931 census gave the population as 94,105, of whom 93,415 were natives (Polynesians and Melanesians). Capital, Tulagi. Administration is in the hands of a resident commissioner, with headquarters on Guadalcanal, and a nominated advisory council. Chief products are coconuts, rubber, sweet potatoes and fruits.

**BRITISH SOMALILAND.** A British protectorate on the Gulf of Aden, near the eastern tip of the African continent. Area, 68,000 square miles. The nomadic population is estimated at 700,000. Capital, Berbera. The protectorate is administered by a military governor who exercises all executive and legislative functions. The country was invaded by Italian forces in 1940 and recaptured by the British in 1941. The economy is pastoral, with camels, sheep, and goats as sources of income. Where rainfall is adequate the land is cultivated. Frankincense and myrrh are produced in the east. Animal products are the chief exports and cotton goods and food products the chief imports. Military Governor, Col. G. T. Fisher, appointed in 1943.

**BRITISH WEST AFRICA.** A region comprising the following British territories: GAMBIA, GOLD COAST, NIGERIA and SIERRA LEONE, each of which is a colony and protectorate. For administrative purposes mandated TOGOLAND is attached to the Gold Coast.

#### BRITISH WEST AFRICA: AREA AND POPULATION

Territory	Sq. Miles	Population
Gambia.....	4,068	205,000 *
Gold Coast (with Togoland)....	91,843	3,962,692 <sup>b</sup>
Nigeria (with Br. Cameroons)...	372,674	21,329,328 *
Sierra Leone .....	27,940	2,121,100 *
Total.....	496,525	25,618,120

\* 1940 estimate. <sup>b</sup> 1942 estimate. • 1943 estimate.

and the CAMEROONS under British mandate to Nigeria. West African governors are members of the West African Council for the area. Currency is controlled by the West African Currency Board. The area and population of the territories is shown in the accompanying table.

**BROOKINGS INSTITUTION.** A non-profit corporation devoted to research and training in economics and government. The income of the Institution is derived from grants from foundations, its own endowment, and the sale of publications. Publications resulting from its research program in 1946 included the following: *Relief and Social Security*, by Lewis Meriam; *Regulation of the Security Markets*, by Harold G. Moulton, George W. Edwards, and Willard E. Atkins; *Americans in Persia*, by Arthur C. Millsbaugh; and *China's National Income*, by Ta-Chung Liu.

The home of the Institution is situated at 722 Jackson Place, Washington 6, D.C. Its officers for 1946-47 were: Chairman: Robert P. Bass. Vice Chairman: Dean G. Acheson. President: Harold G. Moulton. Vice President: Edwin G. Nourse. Treasurer, Henry P. Seidemann. Secretary: Elizabeth H. Wilson.

**BROOKLYN INSTITUTE OF ARTS AND SCIENCES.** One of America's oldest and largest institutions for informal education, located in Brooklyn 17, New York. Its public activities are conducted at four centers: The Department of Education at the Academy of Music, the Central Museum, the Children's Museum, and the Botanic Garden. Founded in 1824, the Institute was incorporated in its present form in 1890. Total membership is about 5,300 and is open to everyone.

The Department of Education at the Academy of Music presents an adult education program annually of concerts, lectures, forums in every major field of the arts and sciences. Approximate attendance at these events for the season 1945-46 was 250,000.

The Institute's Museums possess collections in art, ethnology, and natural science. During 1941, the Art and Photography Classes formerly conducted at the Department of Education at the Academy of Music were transferred to the Brooklyn Museum to form the new Art School of the Brooklyn Museum. Attendance at both Museums for the year 1946 totaled 537,877.

The Institute's Botanic Garden comprises more than 50 acres and plant houses containing tropical and sub-tropical species. Botanic Garden attendance during 1946 totaled 1,436,051.

Officers: Adrian Van Sinderen is the President of the Brooklyn Institute. Julius Bloom is Director of the Department of Education, Charles Nagel, Jr., Director of the Brooklyn Museum, and Dr. George S. Avery, Jr., Director of the Botanic Garden.

**BRUNEI.** A state on the northwest coast of Borneo, under the protection of Great Britain. Area, 2,226 square miles. Population (1931 census), 30,135. Capital, Brunei (12,000). The general administration of the state is in the hands of a British Resident, and the supreme authority is vested in the Sultan in Council, which includes the Resident and the Sultan as President. Brunei produces chiefly crude oil, mangrove extract and rubber. Rubber is a relatively new product in Brunei, and although there were 8,329 acres under rubber in 1940, the postwar rehabilitation of the area has been slow. Through June, 1946, the Borneo Rubber Buying Unit purchased 547 tons in Brunei, about one-half of the country's prewar capacity.

**BUDGET, Bureau of the.** A division of the Executive Office of the President, transferred from the Department of the Treasury in 1939, which assists the President in the preparation of the Budget and the fiscal program of the Government. Its chief branches pertain to Legislative Reference, Estimates, Administrative Management, Statistical Standards, and fiscal programs (the Fiscal Division). The Bureau has the authority to assemble, correlate, reverse, reduce, or increase the estimates of the Government. Under the Government Control Act of December 6, 1945, similar authority was given the Bureau with respect to the preparation and review of budgets of wholly-owned Government corporations. Director: James E. Webb.

**BUHL FOUNDATION.** A foundation established in 1928 by Henry Buhl, Jr. Capital assets were \$12,-

749,084 in 1946, and expenditures for the year totaled \$483,453. The Foundation's programs center in the Pittsburgh area, where it has sought to provide more adequate factual bases for social work and regional economic effort, to promote research in public health and the natural sciences, and to develop the community's resources in higher education. Another objective is the advancement of housing standards for American cities, as exemplified in large-scale, planned communities administered on a long-term investment basis. In demonstration of this last-named objective, the Foundation operates Chatham Village in Pittsburgh, built in 1932 at a cost of \$1,700,000. The Buhl Planetarium and Institute of Popular Science was built at a cost of \$1,100,000 in 1939 as a gift to the people of Western Pennsylvania. Director: Charles F. Lewis. Offices: Farmers Bank Building, Pittsburgh 22, Pennsylvania.

**BUILDING.\*** The fact that good dwelling units cannot be built at the \$10,000 figure in many sections of the country, and that new dwellings must be priced beyond the reach or desire of most veterans, may well bring about the belated realization of the fact that our economy demands the production of housing for *all* citizens. Certainly veterans should not be saddled with houses built at peak prices, especially as the majority prefer and need rental housing.

**Building Supplies Gain.** In the final quarter of 1946 a still spotted but improving picture on building materials was noted with National Housing Agency citing "impressive increases." Both National Housing Agency and Civilian Production Administration continued their efforts to channel more and more materials directly into veterans' housing. They added six more items to the priority list, bringing to 66 the materials covered. Added items are electrical service entrance equipment, furnace pipes and fittings, copper tubing and fittings, copper sheet, galvanized steel sheet, and building papers and sheathing papers.

Civilian Production Administration restricted the \$15,000 "small job allowance" on industrial building to structures of 10,000 sq. ft. or more; it extended controls over swimming pools, boardwalks, roller coasters, drive-in theaters, parking lots and tennis courts. More lumber, millwork, hardwood flooring and construction plywood were made available.

While all this was going on there was much concern over the growing black market on nails. In a related series of actions, National Housing Agency Chief Wyatt approved a premium payment plan on nails and nail rod, leading nail manufacturers took steps to boost production goals to the record high of 77,000 tons a month by December, and nails were put on the critical list for HH ratings.

Further continuing his stimulus to building materials production, Wyatt issued the tenth premium payment regulation—for sand lime brick. Plants whose output is affected by winter weather will be allowed special adjustments on quotas.

**Guaranteed Contracts.** The Housing Expediter also began putting guaranteed market contracts into play. Nearly 30,000 factory-built homes are called for under the first two such contracts. One with the Homeola Corporation of Chicago calls for 19,400 plywood structures, and the other with the William H. Harman Corporation of Philadelphia is to cover 10,000 steel houses. A third contract was entered into with American Fabricators of Louisville for

\* This article is reprinted by courtesy of the *Architectural Record*.

7,500 plywood houses. Homeola expects to step up production to 100 houses a day while the Harman group plans to start with 50 houses in December and to increase output to a peak of 1,000 by next May. Reconstruction Finance Corporation will purchase at 90 percent of the factory price any house that the producers cannot sell.

Negotiations were placed under way with Andrew J. Higgins of New Orleans regarding a "package" of panel units for the walls, partitions, and ceiling of a house but not including the roof, floor, doors and trim, cabinets, plumbing, heating and electrical work. The panels include two steel sheets faced with a mat-surface vitrified enamel with a core of expanded concrete.

In connection with the emphasis on prefabrication, the Prefabricated Home Manufacturers' Institute advises of progress in the South in modernizing building codes to provide workable regulations for the construction of prefabricated homes.

Official hopes for the prefabricated home program were hit heavily in November by the Reconstruction Finance Corporation refusal to grant initial requests for credit in this field. The cases involving an estimated 100,000 houses, were considered bellwethers with potentially wide indirect effects.

**Lumber Steps Taken.** With the lack of lumber sending shivers up the governmental hierarchy clear to the White House, President Truman temporarily waived duties on imported timber, lumber and lumber products. Included among the products are flooring, plywood, red cedar shingles, and packing boxes. Reason for the move, say those in the know, is that competitive bidding on world markets could swing potential imports away from this country.

Coincident with this, lumber imports passed prewar highs, coming in at the rate of 1.4 billion board feet a year or twice the average prewar figure. Inflow of some scarce building materials also increased, including plywood, wood shingles, plaster rock and gypsum, and building brick. Official word is that Finland and Sweden may ship us wooden prefabricated houses.

Another official note on lumber is an estimate that 1946 production may reach 33 billion board feet, or 5 billion above last year. As to 1947, Expediter Wyatt anticipates that the total will be swelled by 1.6 billion board feet due to the 2,700-mile access road program.

**Surplus Sales Slanted.** The federal government's surplus property sales during the fall were slanted heavily to the veterans' housing program. In fact, the War Assets Administration promised that "vir-

tually all" war surplus building materials and equipment would be made available for veterans' housing by the start of winter. Its streamlined sales plan was expected to get rid of all such surplus goods before Christmas, possibly by December 1.

In another field, War Assets Administration moved to boost the output of pig iron for housing. It leased the blast furnace at Gadsden, Alabama, for production under the National Housing Administration premium payment program. National Housing Administration announced further that three other blast furnaces would produce for housing under premium payments. A Civilian Production Administration order provides for allocations of pig iron for bathtubs, sinks, and lavatories, cast iron soil and pressure pipe, builders' hardware, etc.

**Labor Still Short.** Labor shortages continue to be a problem in construction. These are expected to show up even more as materials bottlenecks are broken. The United States Employment Service reports major labor markets encountering shortages in skilled building crafts, especially carpentry and bricklaying.

The Labor Department reported that a million and a quarter construction employees were added to the work force in the 12 months following the war's end, bringing August 1946 employment to 2,321,000.

**From Many Sources.** With construction playing an increasing role in the national economy, numerous federal agencies contribute to the over-all mosaic on construction. Here are items:

The Home Loan Bank System expects home financing credit by member associations to approach the record volume of \$7 billion for the 1946-47 period—\$4 billion for houses under Veterans' Emergency Housing Plan (VEHP).

Public Health Service advises that preliminary surveys under the new Hospital Construction Act are progressing in many states. Twenty had completed their surveys in October and 20 more were doing so.

Department of Justice was expected to appeal the Federal Circuit Court decision in Chicago which threw out the Federal Trade Commission's order against basing point prices for cement.

National Housing Administration in an analysis of HH authorizations for the January 15-March 29 period advises that eight out of ten were single-family detached houses. One-story houses were most popular, representing about 70 percent. About 40 percent of the dwellings were five-room and another 40 percent were divided between four- and six-room structures.

<sup>b</sup> Nine months actual, 3 months estimated.

Commerce Department's Office of Technical Services has a 154-page report on two successful solar heat collectors developed under a War Production Board sponsored wartime research which bring "effective use of the sun's heat for residential heating closer to realization."

**BULGARIA.** A Balkan republic (proclaimed September 15, 1946; see *Events* below) in southeast Europe. Area: 39,825 square miles. Population (estimate of January 1, 1940): 6,308,000. Chief towns: Sofia (capital) 401,300 inhabitants in 1942, Plovdiv (Philippopolis) 113,000, Varna 78,000, Ruse (Ruschuk) 52,000, Burgas 41,000. Vital statistics (1943), based on prewar boundaries: living births, 21.1 per 1,000; deaths, 14.2; marriages, 12.5; infant mortality, 144 deaths under one year per 1,000 live births.

**Education and Religion.** In 1938-39 there were 252 kindergartens with 12,702 pupils, 4,743 public elementary schools with 596,111 pupils, 2,044 secondary schools with 360,786 pupils, and one State University (at Sofia) with 6,030 students.

**Events, 1946.** The central factor in the history of Bulgaria during 1946 was the strain, never fully relaxed and frequently reaching the bursting point, between the Communist dominated Fatherland Front Government and the opposition parties. The Government enjoyed the support of Moscow, to which it owed its existence. The opposition looked for support to Great Britain and the United States in asserting its claims for its views to be represented in the Government and its protests against the oppressive discrimination which it claimed to suffer at the hands of the Government. Both Great Britain and the United States were represented in the Allied Control Commission which was designed to oversee Bulgarian affairs, but almost as soon as the Commission was set up, shortly after the country was free of Axis forces, these representatives began to complain that their views, especially as regarded democratic representation for opposition parties, were virtually ignored. It had been the policy of the Fatherland Front Government, which was nominally a coalition, but in fact Communist-dominated, to weaken opposition groups by setting up in each group a rival leadership favorable to itself, which then sought to wrest control of the group from its former leadership and thus neutralize its opposition to the Fatherland Front. By the end of 1945 British and American dissatisfaction had issued in a number of protests, as a result of which a conference was held in Moscow at the end of December 1945. On December 26, 1945 an agreement was reached which provided for substantial representation of opposition parties in the Government. Disagreements concerning the implementation of this provision occupied most of 1946.

On January 4, 1946 the ministerial council met to discuss the results of the Moscow conference and to receive the friendly advice of Soviet representatives in Bulgaria. The council requested Prime Minister Kimon Georgiev, Minister of Interior Anton Yugov, and Minister of War Damian Velchev to contact duly authorized representatives of democratic groups not in the Fatherland Front with a view to their joining the Government. The Government submitted certain proposals which the opposition representatives must accept before being admitted to the Government, to wit: They must approve the foreign and internal policy of the Fatherland Front, comply with the basic principles of Fatherland Front policy, and agree that Parliament remain in session until March 28, the date previously determined, so that it might give its approval

to the budget and to the municipal election and other laws and decide on summoning the Grand National Assembly to consider constitutional changes. For its part the Government agreed that future elections would be held with separate lists for individual parties or free coalitions of parties (instead of the single lists to which the opposition had taken exception), but stipulated that opposition parties entering the Government must end their animosity towards the Government. These terms were rejected by the opposition, who made certain counter-proposals, to wit: The Ministries of Interior and Justice must go to any party except the Communist; past internal policy could not be approved because it had been drafted by a Government and Parliament that was unrepresentative and undemocratic; the army must be national and not partisan; all parties must have access to radio broadcasting; and Parliament must be dissolved and new elections held. On January 7 Georgiev, Yugov, and Foreign Minister Petko Stainov proceeded to Moscow to seek guidance for resolving the impasse. Upon Stalin's order Deputy Foreign Minister Andrei Vishinsky went to Sofia and invited Kosta Lulchev and Nikola Petkov, leaders respectively of the Social Democrat and Agrarian Parties, to enter the Government. These leaders refused, on the ground that the Government proposals did not constitute sufficient improvement. Soviet comment was that this attitude was absurd and showed disloyalty to the Bulgarian Government and people. The Government continued its attacks and threats against the opposition, the opposition grew more obdurate, and the Moscow agreement became a dead letter. On March 21 the Fatherland Front Government of Kimon Georgiev resigned, but the new Government formed by Georgiev on March 31 was again without representation of the opposition, which persisted in its demands that (1) the Parliament be dismissed and new deputies elected; (2) the single list ballot be abandoned; and (3) the Communists relinquish control of the Ministries of Interior and Justice.

Despite Government efforts to undermine it, allegedly involving even acts of violence, the opposition seemed to grow more united, stronger, and more outspoken. It profited by the restiveness of Zveno, the largest non-Communist component of the Fatherland Front, which it had joined only for reasons of expediency, by the dissatisfaction of the Church, and by the activity of certain student groups and of certain Macedonian activists; and in its principal spokesman, Nikola Petkov, it found a vigorous leader. After his refusal to join the Government Petkov published an open letter to Prime Minister Georgiev condemning Fatherland Front attacks upon him and demanding an investigation, and was sharply rebuked in the Government's organ, *Otechestven Front*. Zveno openly disapproved of Fatherland Front measures and tactics. It opposed confiscation of "illegally acquired property," which the Fatherland Front favored, and Vasil Yurukov, a member of Zveno's Executive Committee and editor of its *Izgrev*, spoke out against "the fierce political struggle and the destruction of political enemies." Yurukov was a close associate of Minister of War Damian Velchev and represented the Zveno view which held that Prime Minister Kimon Georgiev, fearful of the consequences of his former ill-treatment of the Communists, was now grown wholly subservient to them. Velchev himself veered from his former neutrality and incurred the anger of the Communists by testifying on June 7 that Dr. Georgi M. Dimitrov was an outstanding Bulgarian patriot and had not sought to

subvert Bulgaria's military effort against Germany, which was the principal charge against Dimitrov. Dr. Dimitrov, who had taken refuge in the United States, was sentenced to life imprisonment in absentia on July 10. Nevertheless the opposition continued to attack Zveno for its opportunism. A principal issue was the restoration of the old constitution, which the opposition desired, while Zveno favored the Fatherland Front view that its restoration would be tantamount to restoring the old regime.

At the celebration of the thousandth anniversary of the foundation of the Rila monastery on May 26 Government spokesmen first flattered the clergy by references to the glorious past of the Bulgarian Church and then criticized their continued prayers on behalf of the dynasty. The Bulgarian Orthodox Church, they declared, must become the People's Republican Church in fact as well as name. Dimitrov and the Russian Patriarch Alexei called upon the Bulgarian clergy to show greater comprehension of political realities than had the Russian Church after the 1917 revolution. On June 5 opposition papers carried a short appeal to the Exarch Stefan, advising him that the whole Bulgarian nation "expected him to defend the Bulgarian Church." Stefan made no reply and maintained a formally correct attitude. He continued public prayers for Tsar Simeon, however, and otherwise showed sympathy for the opposition. In Sofia it was said that the Fatherland Front and the Soviets would promote Stefan's desire to be elevated to the Patriarchate in return for his support.

Opposition to the Fatherland Front was also involved in certain aspects of the activity of IMRO (Internal Macedonian Revolutionary Organization, founded in 1896 to liberate Macedonia from the Turks). IMRO "nationalists" were displeased with the "federalist" position taken by the Macedonian Congress which met at Sofia on April 4. Besides deploring atrocities in Greek Macedonia, that Congress had approved a People's Republic of Macedonia within a Federated Yugoslavia and supported Slav unity under U.S.S.R. Anti-Government activities on the part of student organizations provoked a decree of (Communist) Minister of Interior Anton Yugov, with the concurrence of the Prime Minister, that none but members of the Fatherland Front might be admitted to institutions of higher learning. Government spokesmen and organs continued to threaten those opposed to the Fatherland Front. They insisted that the army and state institutions must be purged of fascists and traitors, and admonished vigilance against repetition of the coup of June 9, 1923, when the Stambolsky regime was overthrown. Communists did in fact control the army. Party members were in key positions, and non-Communist generals gave full cooperation. The system of political commissars, most of whom were Communists, ensured party regularity. Measures were also taken against the press. The Democratic Party's *Zname*, which had harshly criticized the Government, the economic policy, and the Soviet "occupation" was suspended for two months. Printers' and other unions dealing with newspapers took steps against Petkov's *Narodno Zmedelsko Zname* and the Socialist *Svoboden Narod*. The elderly and respected writer Trifun Kunev was beaten up. Petkov complained to the Prime Minister that violence was being used by the militia against members of the Agrarian Union.

At the instance of Vasil Kolarov, after Georgi Dimitrov the most important Communist figure in Bulgaria, the Sobranie voted approval of all Fatherland Front legislation enacted after September

9, 1944, and recommended further social and political legislation. Among these was the Land Reform bill, which had been approved by the Ministerial Council on January 25, calculated to provide land for peasants and create large cooperatives. Of Bulgaria's 41,450,000 decare (2,471 acres) of arable land, 38,900,000 were privately owned, 2,050,000 belonged to institutions, and 500,000 to the state. Average holdings were 72 decare in 1897, 40 in 1945. Approximately 15% of holdings were over 100 decare, 60% 30 to 100, and 24% under 15; that is, some 86% were at or below subsistence level, which was reckoned at 90 decare. Government measures as projected would seem able to provide only 4,500,000 of the 10,000,000 decare needed to give each peasant the minimum. In the September 8, 1946, plebiscite 92% of the vote was against the monarchy, and the boy king, Simeon II and his mother, Princess Ioanna, retired to Egypt. On September 15 Bulgaria was formally proclaimed a People's Republic.

In foreign relations Bulgaria was concerned to refute territorial claims put forward by Greece and to obtain British and American recognition for its Government. After long and vehement attacks on Bulgaria, including charges of repeated aggression and atrocities in the past and of currently fostering the "autonomist" bands which were allegedly responsible for violence in Greek Macedonia, the Greek Government in April submitted to the Council of Foreign Ministers meeting in Paris claims for Bulgarian territory north of Aegean Macedonia. Bulgaria rejected the claim and submitted counter claims for an outlet on the Aegean. The draft treaties which were made known at the end of July provided for reparations to Greece but left the border question undecided. In May the Sofia radio claimed that reparations to Greece had been completed; British and Greek representatives declared the statement untrue. In May also, Greece demanded the extradition, for trial as a war criminal, of General Ivan Marinov, who had commanded the occupation troops in Macedonia but had helped the Fatherland Front and was now Bulgarian Minister in Paris.

British and American recognition of Rumania made their failure to recognize Bulgaria more pointed and more irksome to the Bulgarians. American recognition was withheld because of Bulgarian failure to implement the Moscow agreement by accepting opposition representatives in the Government upon terms mutually acceptable, and American feeling was exacerbated by the cavalier treatment accorded its representation on the Allied Control Commission. The American position was communicated to General Stoichev, Bulgarian Political Representative in Washington, in an aide-memoire of February 22, with which the British associated themselves. Further exchanges failed to improve the situation. In regard to the Allied Control Commission, the United States representative, Major General John A. Crane, complained that the United States had no effective participation in the Commission, that it was not informed of decisions issued in the name of all three Allies, and that the privileges of American personnel had been arbitrarily curtailed by the Russians.

In the elections of October 27 the Government parties won 374 seats and the united opposition 101. British Foreign Office spokesmen declared the elections were fraudulent because of intimidation and other irregularities. The opposition *Narodno Zmedelsko Zname* printed obituaries of Agrarian Party members killed during the election, and the Government issued a communiqué listing those of

its adherents who had been killed. As a result of the elections Communist strength was slightly increased in the third Fatherland Front Government, formed by Georgi Dimitrov on November 22. The Government included ten Communists, five Agrarians, two Socialists, two Zveno, and one Independent, portfolios being distributed as follows: Prime Minister: Georgi Dimitrov, Communist; Deputy Prime Ministers without Portfolio: Georgi Popov, Socialist, Traycho Kostov, Communist, and Alexander Obbov, Agrarian; Sub-Prime Minister and Foreign Affairs: Kimon Georgiev, Zveno; Interior: Anton Yugov, Communist; War: Georgi Damyanov, Communist; Finance: Ivan Stefano, Communist; Education: Mincho Neychev, Communist; Agriculture: Georgi Traykov, Agrarian; Electrification: Manol Sekelarov, Communist; Industries: Khristo Lilkov, Zveno; Trade: Yurdan Bojilov, Communist; Public Works: Georgi Dragnev, Agrarian; Social Affairs: Zdravko Mitovsk, Social Democrat; Health: Racho Angelov, Communist; Railroads: Stefan Tonchev, Agrarian; Information: Dimo Kazassov, Independent; Supreme Economic Council: Dobri Tarpichev, Communist; Justice: Radi Naydenov, Communist.

**Production.** Agriculture is the most important occupation of the people—the chief products being cereals, potatoes, tobacco, rose oil, cotton, beet sugar, and grapes. Livestock (1945): 1,367,928 cattle, 714,576 goats, 837,931 pigs, 471,000 horses, and 6,614,899 poultry. The output of raw silk in 1943 amounted to 159 metric tons. Mineral products include coal, lignite, cement, and salt.

**Finance.** Budget estimates (1946): revenue 42,910 million leva and expenditures 42,910 million leva. The total public debt on Sept. 1, 1943, was estimated at 53,000 million leva.

**Foreign Trade.** In 1942, including bullion and specie, imports were valued at 12,929,000,000 leva; exports, 13,418,000,000 leva. For the period Jan. 1 to Aug. 31, 1943, imports were valued at 9,663,000,000 leva, and exports at 10,185,000,000. The main exports were tobacco, fruit, eggs, wheat, hides, and wine.

MOSES HADAS.

**BURMA.** A British possession in southeastern Asia with a population of 16,824,000 and an area of 261,610 square miles, comprising Burma proper, the Chin Hills and Kachin Hill Tracts, Shan States and unadministered territory. Burma was separated from India in 1937 under the Government of Burma Act, 1935, and given its own constitution and government. Before the Japanese occupation in 1942 the executive power was vested in a Governor (appointed by the British Crown) who was advised by a council of ministers. The Governor had control of foreign affairs. Domestic affairs were administered by a Burman ministry responsible to a Burman legislature. Large districts in the northern and eastern hill districts were excluded from the legislature's control and placed under the jurisdiction of the Governor.

Upon the Japanese invasion the British Governor, the Burmese Premier and certain other Burmese officials set up headquarters at Simla, India. The constitution was suspended. On August 1, 1942, the Japanese set up a form of government made up of a joint Burmese and Japanese administration under the nominal leadership of U Ba Maw, a former premier of Burma. With the defeat of the Japanese the country reverted to its former status. Civil government was resumed in October, 1945, when Sir Reginald Dorman-Smith, who first became governor in 1941, returned to Rangoon.

**The People.** At least two-thirds of the population, most of whom live in rural districts, are of Burmese origin. Indians and Chinese form large groups in the otherwise extremely diversified population.

The standard of education in Burma remains low, with only one-half of the male and fourteen percent of the female population literate. Buddhist monasteries in the villages furnish a certain amount of elementary education. Approximately eighty-four percent of the people are Buddhists. Nearly all the rest belong to Animist, Mohammedan, Hindu, or Christian sects.

**Government.** Pending the holding of a general election and the restoration of government under the Government of Burma Act, 1935, administration was in the hands of the Governor with direct responsibility to the British Government. On August 4, 1946, it was announced in London that Major-General Hubert E. Rance would succeed Sir Reginald Dorman-Smith, who had been absent from his duties because of illness and for whom Sir Henry Knight had served as Acting Governor. After September 26 the Executive Council assisting the Governor became a coalition body with 11 members.

**Events, 1946.** The year 1946 was one of political and social unrest in Burma, which the British Labor Government's offer of independence on the same terms as India, made public on December 20, was intended to allay. The preceding British Government's White Paper of May 17, 1945, had stated the Government's intention to assist Burma "to attain a status similar to that of the Dominions and this country" (see YEAR BOOK for 1945, p. 92). The early establishment of an Executive Council was envisaged, but it was announced that the existing system of administration by the Governor directly responsible to the British Government would be continued to December, 1948.

The dissatisfaction with the offer expressed by many Burmans, including the well-organized Anti-Fascist People's Freedom League (AFPFL) which refused to participate in the Executive Council named in November, 1945, unless it could have 11 of the 15 members and allocate portfolios, persisted in 1946. Early in the year the AFPFL, meeting in Rangoon, formulated criticisms of the British Government which won ready Burmese approval partly because of that Government's refusal to afford facilities for a deputation from the League to go to London and place its proposals before the British authorities. The League adopted a resolution demanding complete independence for Burma.

The League, which was in general composed of young Burmans, included members of the Communist and Socialist parties, the Communist Peasant party, trade unions, and others. As the year progressed there was a tendency for older men to join. The President was General Aung San, former Commander in chief of the pro-Japanese Burmese forces, and the General Secretary was Thakin Tan Tun, leader of the Communist Party.

The leader of the Myochit Party, U Saw, took part in the protests in February when he sent a letter (made public on May 16) to the Secretary of State threatening to withdraw the three members of his party from the Executive Council unless a satisfactory reply was received. The letter protested against the terms of the White Paper and asked for the transfer of Burmese affairs from the Burma Office to the Dominions Office.

**Disorder in the Country.** In the meantime much of Burma was torn by robbery, murder, and violence, with dacoity (armed robbery), always endemic in Burma, on the increase. It was reported in the

British House of Commons that in March there were in Burma (excluding the Rangoon area) 246 murders, 558 robberies with attempted murder, 785 robberies, and 347 cases of cattle theft. The decline in rice production was directly related to the increase in dacoity. Cultivators refused to live in their temporary huts near their distant fields and tended to work only those fields which could be conveniently cultivated from the villages, for fear of risking their lives. Cultivators and traders were afraid to take goods to market because the roads were not safe. It was observed that dacoits and other thieves preferred to take consumer goods, particularly cloth, of which there were serious shortages.

The police, to whom the maintenance of order was largely left instead of to the military forces, were inadequate and undermanned. In September there was a strike of the Rangoon police, soon reinforced by one of postal workers, which was on the surface, a strike for higher pay but which won public and press support and developed into a protest against the terms of the 1945 White Paper.

**Coalition Executive Council.** After Sir Hubert Rance, succeeding Acting Governor Sir Henry Knight, arrived in Burma, the Executive Council resigned. On September 28 it was announced from Rangoon that the Governor had been successful in forming a coalition cabinet, with 6 of the 11 seats going to members of the Anti-Fascist People's League. Aung San, the President of the League, was allotted the portfolio of Defense and External Affairs. The five seats allotted to those who were not members of the League went to U Saw, leader of the Moyo-chit Party; Thakin Ba Sein, leader of the Dobama Party; U Ba Thein, representing the Sinyetha Party; U Tin Tut, who was independent; and a Karen representative to be selected later. In a radio speech, Sir Hubert said it was intended that the Council should have the position that its ministerial predecessor had under the Act of 1935.

In a three-day session of the Anti-Fascist League at the beginning of November it was demanded that the Government take immediate steps to gain a seat for Burma in the United Nations. The League also adopted a resolution expelling the Communists from their ranks. Communist leader Thakin Tan Tun observed that the expulsion was "immaterial" and that "On With the Revolution" would continue to be the Communists' policy.

**Offer of Independence.** In spite of the improvement in the political situation after the formation of the coalition Executive Council, economic and social conditions in Burma remained disturbing and the British Government was obviously concerned about the general unrest. On December 20 Prime Minister Clement Attlee announced in the British House of Commons an offer of independence to Burma on the same terms as that to India. Attlee took cognizance of the necessity for reconsidering the White Paper plan in view of the impatience of the Burmese people and said that Britain did not desire to retain within the Commonwealth and Empire any unwilling peoples. The Prime Minister invited a Burmese delegation to come to London for a conference.

The offer was sharply criticized by Winston Churchill, Leader of the Opposition, on the grounds of its extraordinary haste. He spoke with some bitterness of the "decline and fall of the British Empire" and "the steady and remorseless process of divesting ourselves of what has been gained by so many generations of toil, administration, and sacrifice."

**Economic Problems.** It proved impossible to repair

the economy of Burma in 1946. The devastated cities and transportation facilities could not be restored until labor, money, and materials were available. Consumer goods, used almost to the vanishing point during the Japanese occupation, remained critically short. The most serious economic problem however, was the decline in rice production.

Before the Japanese occupation Burma produced 6,000,000 to 7,000,000 tons of rice a year. About one-half of this was exported, chiefly to India. In the spring of 1946 many of the fields remained uncultivated. War damage, difficulties with marketing and prices, fear of marauding deserters or dacoits, loss of draft animals and difficulties of transportation fostered the habit of raising little more than home needs. Crop reports showed that the yield would just about suffice for those needs, leaving no exportable surplus, and that in 1947 Burma, the world's chief rice-exporting country, might itself become a deficit area. Government grants for bringing land back into cultivation and agricultural loans appeared to have little quantitative effect.

By the end of the year Burma had achieved a measure of independence in its banking and currency system, including freedom from the former tie with the Indian rupee. The Financial Adviser to the Government of Burma announced that beginning on April 1, 1947, Burma would have its own currency, managed by a currency board established in London for operation as of October 1, 1946.

**Production and Trade.** The chaotic economy of 1946 showed little reflection of Burma's prewar organization. Before invasion two-thirds of the people were dependent on agriculture, which was dominated by rice, both in production and export. A little rice was exported in 1945-46, but all from old stock. Ordinarily teak was the second export, and petroleum was also sold abroad in considerable quantity. Lead, tin, tungsten, and silver were important products.

ALZADA COMSTOCK.

**BUSINESS REVIEW.** American business experienced a postwar boom during 1946, despite a record wave of strikes. While production was retarded to some extent by labor troubles, particularly during the first half of the year, and shortages of a number of materials and parts, it was far higher than in any previous peacetime year. Rising wages and prices and larger profits for most industries were other boom phenomena. Inventory accumulation proceeded at a record pace, so that stocks of goods in the hands of manufacturers and distributors attained peak levels by the end of the year. Only here and there did consumer resistance and price reductions make their appearance, giving rise to uneasiness over the longer-term outlook.

Business developments during the year bore elements of similarity to 1919, when the post-World War I boom was in full swing. At that time also wages and prices rose sharply above wartime levels, inventory accumulation proceeded rapidly and profits were large. But that era of prosperity proved short-lived, and a severe deflation in prices and production followed in 1920. Expectations that a post-World War II recession would be of a milder character were based upon the more acute shortages of goods prevailing, the far larger purchasing power possessed by the population and the more limited extent of the rise in commodity prices that had occurred.

Comparisons of 1946 gross national product,

national income, retail sales, inventories, and other statistics stated in dollars with those of the year before are of limited significance because of the rise in commodity prices that took place during the year. With the general wholesale price level more than 30 percent higher, larger dollar figures evidently do not mean that a corresponding increase occurred in physical quantities. As during inflationary periods in the past, dollar totals were inflated by mere price changes. The rise in national income well above the wartime peak in the latter part of 1946 primarily reflected the inflationary trend of wages and prices. The physical volume of production, as measured by the index of industrial output compiled by the Board of Governors of the Federal Reserve System, at best remained some 25 percent below the all-time peak established in October, 1943, when a huge war production was superimposed upon the civilian economy.

**Government Controls.** While the year was marked by the liquidation of most wartime Government controls over business in existence at its beginning, including nearly all price controls, a few new business regulations were imposed to cope with particular problems. The most significant of these were issued in connection with the veterans' housing program. VHP-1, issued at the end of March, severely limited non-residential construction in order to free materials and labor for the construction of low-cost homes for veterans. The Veterans' Emergency Housing Act, enacted in May, gave veterans purchase priorities on new houses, allocated scarce building materials and provided subsidies to hold down prices of building materials. Restrictions were tightened on exports of lumber and other scarce materials.

Following the sweeping Republican victories in the November Congressional elections, which indicated overwhelming public desire to speed termination of war controls, a large number of remaining restrictions were removed and even the veterans' housing program was drastically modified in December. The Civilian Production Administration was replaced by the Office of Temporary Controls. On the final day of the year, President Truman issued a proclamation announcing the termination of hostilities, which automatically ended several wartime measures and executive powers of the President, while others were scheduled to end six months later on June 30. By the year's end, remaining controls were those affecting scarce imported materials, like rubber and tin, and several domestic materials in short supply required for building or other essential uses.

**National Product and National Income.** The value of the gross national product, or all goods and services produced in the course of the year, was \$194,000,000,000 in 1946, according to preliminary estimates of the Department of Commerce. This represented only a slight decline from the total of \$199,000,000,000 in 1945. However, the decline in the volume of goods and services produced from the wartime level was considerably greater, because of the rise in prices that occurred during 1946. In terms of 1944 prices, the Department of Commerce estimated the gross national product for 1946 at \$170,000,000,000, as compared with \$192,000,000,000 in 1945. Allowing for the virtual disappearance of war production, however, these figures clearly indicated a record output of civilian goods and services.

Income payments to individuals in 1946 were estimated by the Department of Commerce at \$183,000,000,000, as compared with \$160,000,-

000,000 in 1945 and \$92,000,000,000 in the record prewar year 1941. Disposable income of individuals, after taxes, reached the record total of \$144,000,000,000 for the year. Savings dropped to little more than half the 1945 level, and consumer expenditures jumped to \$127,000,000,000, as against the previous record of \$106,000,000,000 achieved in 1945.

**Impact of Price Rise.** Prices held reasonably stable until the expiration of the Price Control Act on June 30. Although controls were temporarily reimposed under a modified measure signed by the President on July 25, they were never truly effective again. The new law required items unimportant to living or business costs to be freed of price control. The termination of meat price controls in October was followed on November 9 by termination of all ceilings except on rents, sugar and rice. During the second half of the year, wholesale prices rose 24 percent and the consumers' price index of the Department of Labor advanced 15 percent. Farm products, foods, textiles and chemicals showed the sharpest price advances. These price increases outstripped the increase in national income by a considerable margin. The tendency for the actual purchasing power of the population to decline because of the increase in prices is illustrated by the following table translating per capita disposable income into 1944 dollars (taken from the Economic Report of the President):

PER CAPITA DISPOSABLE INCOME

Year or Quarter	Actual Dollars	1944 Dollars
1935-39 (average).....	497	623
1944 .....	995	905
1945 .....	1,000	978
1946 .....	1,026	925
Seasonally Adjusted Annual Rates		
First quarter.....	983	950
Second quarter.....	1,008	958
Third quarter.....	1,054	921
Fourth quarter.....	1,060	880

**Construction.** Building activity expanded at an unprecedented pace during the year. From a total of \$476,000,000 in January, the value of new construction increased month by month to a peak in August of \$1,075,000,000, a level never reached before in peacetime. A seasonal decline in activity, exaggerated to some extent by resistance to higher construction costs, brought about a decline from this high level in the final months of the year. Increased production of building materials relieved bottlenecks that had greatly added to building costs by holding up completion of projects, so that actual construction costs tended to decline somewhat even though wages and material prices remained high.

Residential construction showed the sharpest increases under the spur of the veterans' housing program, but industrial and other non-residential building also were expanded greatly, despite restrictions. Industrial building for the year established a new high record as numerous projects held back during the war were started. Plant and equipment expenditures by industry dwarfed the previous peaks of 1941 and 1929.

The high level of building activity, as during the 1920's, was reflected throughout the economy. It resulted in greatly increased demands for numerous materials, as well as for labor. But residential construction fell short of the goals set by the Federal housing program, originally 1,200,000 dwelling units to be started, of which 838,000 were to be permanent. Prefabricated housing especially fell short of the mark. But more new dwellings were started than in any year since 1928, except 1941. It

BILLIONS OF DOLLARS

EXPENDITURES FOR NEW PLANT AND EQUIPMENT

was evident that several years of expanded construction would be needed to relieve the very acute housing shortage left by the war.

**Durable Goods Industries.** Output of durable goods industries was hardest hit by the wave of major strikes in the first half of the year. With the restoration of industrial peace, production climbed and during the last half of the year it reached the highest level since V-J Day. Aggregate output of durable goods, however, remained far below the abnormal wartime level, for most munitions were classified as durable goods for statistical purposes.

Production of minerals compared favorably with that of the war period, except for the late spring when coal and copper strikes reduced output. Removal of price controls emphasized the inadequate domestic supplies of most non-ferrous metals, and it was necessary for consumers to bid for imports at rising prices.

Production of producers' durable goods was severely handicapped by materials shortages intensified by the steel and other strikes. Railroad equipment output, for example, was only about 50 percent of the 1941 level. Despite a critical car shortage, manufacturers were not able to step up their schedules until the Civilian Production Administration in the third quarter intervened to help secure needed steel. Agricultural machinery output also was hampered by strikes in plants making these products and in factories of suppliers, but a substantial increase in production was achieved in the last half of the year, so that for 1946 as a whole gains in output of 10 percent as compared with 1945 and 35 percent as compared with 1941 were achieved. In other branches of machinery manufacture, a similar pattern prevailed, with production increases shown for the second half of the year.

The automobile industry, the most important of consumer durable goods lines, was bedeviled by strikes, work stoppages in plants of suppliers and unbalanced inventories of materials that limited output and compelled many factories to close down sporadically for short periods. Production in 1946, the first full year in which the industry could produce for civilian use, aggregated 2,155,924 passenger cars and 940,583 trucks. Even at the end of the year, however, materials shortages were limiting production to a level well below capacity, although the industry was in position to sell every vehicle it could turn out. Output of other consumer durable goods increased sharply in every case, so that by the end of the year it was far above the prewar rate in radios, electric ranges, washing machines and vacuum cleaners, at the prewar rate in mechanical refrigerators, but well below that rate in sewing machines.

The progress made in expanding durable goods output is shown in the following table comparing output for October, the best month of the year as regards industrial production, with the same month of 1945:

DURABLE GOODS PRODUCTION  
(1935-39 average = 100)

	Oct. 1945	Oct. 1946
Iron and steel . . . . .	146	183
Machinery . . . . .	232	268
Automobiles . . . . .	120	190
Lumber . . . . .	76	126
Furniture . . . . .	120	154
Plate glass . . . . .	50	168
Cement . . . . .	108	156
Clay products . . . . .	116	147
Gypsum and plaster products . . . . .	177	215
Abrasive and asbestos products . . . . .	218	251
Durable Manufactures—Total . . . . .	186	214

## INDUSTRIAL PRODUCTION

**Consumer Non-durable Goods.** Production of consumer non-durable goods held at a high level during the year, well above that of the second half of 1945. The textile and other industries were benefited by some improvement in the volume and quality of available labor, as well as by larger supplies of certain materials and fuel. Termination of Government controls in the latter part of the year also helped to increase output of many items.

Production of non-durable manufactures in October, 1946, as compared with the same month of 1945, is shown in the following table:

NON-DURABLE GOODS PRODUCTION  
(1935-39 average = 100)

	Oct. 1945	Oct. 1946
Textile fabrics	131	156
Cotton consumption	128	155
Rayon deliveries	215	242
Carpet wool consumption	93	143
Apparel wool consumption	191	230
Woolen and worsted cloth	149	181
Leather tanning	107	97
Shoes	116	130
Wheat flour	129	135
Butter	72	79
Cheese	155	164
Canned and dried milk	156	142
Meat packing	129	115
Pork and lard	99	116
Beef	159	107
Veal	197	140
Lamb and mutton	134	131
Processed fruits and vegetables	128	167
Confectionery	108	123
Alcoholic beverages	201	208
Cigars	111	127
Cigarettes	216	226
Pulp	164	163
Paper	137	144
Printing and publishing	115	132
Gasoline	129	146
Coke	116	67
Paints	139	148
Soap	124	111
Rayon	238	271
Industrial chemicals	371	403
Rubber products	191	228
Non-durable Manufactures—Total	154	171

**Retail Trade.** An unprecedented demand for consumer goods and services lifted retail trade to the highest level ever recorded. While a large part of the increase in sales reported by retailers reflected higher prices, there was also an increase in the physical volume of goods sold, particularly of durable goods and other items that were not available in wartime. Consumers financed this buying rush chiefly through reducing current savings. Near the close of the year, there was some tendency for consumers to shift their purchases from non-durable goods to the durables which were in short supply, with the result that retailers found it necessary to mark down prices of some products. This was particularly true of sub-standard goods and those in the high price ranges.

Department stores, like other groups of retailers, enjoyed a record year. Indices for both sales and inventories for each month of 1946, with comparisons for 1945, follow:

DEPARTMENT STORE SALES AND INVENTORIES  
(1935-39 average = 100)

	Sales		Inventories	
	1945	1946	1945	1946
Jan.	198	227	148	167
Feb.	211	251	149	171
March	220	260	148	177
April	182	252	156	189
May	188	258	165	200
June	202	275	181	211
July	218	273	189	223
Aug.	200	290	187	221

Nov.	222	273	165	255
Dec.	218	274	168	274
Average for year	207	263	166	213

The widest gains were enjoyed by mail order houses and other retailers serving the agricultural population, whose income was boosted quite sharply by the upturn in farm prices during the later months of the year. Increases in sales of almost 100

Sources: Department of Labor

\* Except sugar, syrup, rice, and rents.

#### MOST OF PRICE RISE OCCURRED AFTER JUNE

percent were reported during the fall months by mail-order organizations.

**Inventory Expansion.** A striking development of the year in all fields of business was the expansion of inventories. In part, this increase stemmed from the increased availability of goods and the ability to rebuild stocks that had been depleted by the war. In part, it reflected the rise in prices, which both increased inventory values and made it attractive for business to carry a larger stock of goods in order to benefit from price increases. A third factor was shortages of "bottleneck" materials and parts, which caused a marked expansion of inventories of goods in process that could not be completed until the items in short supply could be received.

When the war ended, about \$5,000,000,000 of inventories of war materials were turned over by contractors to the Federal Government. In the period following V-J Day, business not only replaced these termination inventories with civilian products, but also expanded inventories by an additional \$7,000,000,000 between V-J Day and October, 1946. This meant that manufacturers', wholesalers' and retailers' inventories were stepped up by \$12,000,000,000 during this fifteen months' period. About half the increase was due to price increases, and the other half to an expansion in the size of stocks on hand.

The great increase in the volume of turnover made larger inventories necessary, but a good deal of concern developed over this problem nevertheless. In the first place, these inventories were unbalanced, chief increases occurring in raw materials and goods in process. Inability to secure certain raw materials and component parts resulted in expanding goods in process to uncomfortable proportions for many manufacturers. Secondly, it was recognized that this increase could not go on indefinitely, and that a point would be reached at which inventories would at best become stabilized. At that point, production could be maintained only if all current output were sold to consumers. Expansion of inventories, or "filling the pipelines" as it was commonly termed, provided a strong but necessarily temporary stimulus to business.

**Commodity Prices.** The very gradual rise in whole-

sale prices that occurred during the war was continued at a somewhat faster pace during the first half of 1946, with growing pressure upon the Office of Price Administration to lift ceilings because of higher costs. When the grant of a wage increase of 18½ cents an hour to steel workers in February established a pattern for wage rates, it became evident that the OPA would have to grant numerous upward adjustments in price ceilings, even if the price control law would be extended. When the law lapsed on June 30, there was a spurt in prices, and reimposition of controls late in July merely slowed down the pace of the rise. When meat price ceilings were ended in October, the whole structure of price regulation collapsed and was terminated by the President's proclamation of November 9 which stated that "the law of supply and demand operating in the market place will, from now on, serve the people better than would continued regulation of prices by the government."

The consequences of the termination of price controls were neither as limited as many advocates of such action had claimed, nor as drastic as more enthusiastic advocates of a continuing OPA had predicted. While the index of wholesale prices rose 24 percent during the last half of the year, and the consumers' price index advanced 15 percent, part of this rise was illusory because many buyers could not previously purchase goods at ceilings, but had to pay premiums on the black market. Furthermore, a part of the increase reflected elimination of subsidies, which was of small concern to the consumer but did involve savings to the Government.

Foods and farm products showed the sharpest

Source: Journal of Commerce, quotations for New York City unless otherwise indicated.

The cost of living index lagged behind the wholesale price index, as usual when price fluctuations occur. In the first place, some component elements were not affected by the advance in wholesale prices. For example, rents and public utility rates remained practically unchanged to the end of the year. Secondly, retail prices of many products were not marked up as rapidly as wholesale, particularly where distributors had large stocks of goods on hand acquired at lower prices. Furthermore, consumer resistance brought sharp declines in a number of individual commodities from high levels established immediately after the end of controls. Meats, lard and butter are examples of commodities that were quoted at the close of the year substantially below the high prices reached in October.

A striking development in the commodity markets was the break in raw cotton following a spectacular rise brought about by the very short crop

and the keen consumer demand for cotton goods, causing record domestic consumption of the fiber. Cash cotton was quoted in New York at almost 40 cents a pound on October 2, a rise of 70 percent over the price of the year before. Late in October, however, a rush to sell raw cotton developed that forced the cotton futures exchanges to close on three occasions. By October 29, the quotation had fallen to somewhat under 30 cents a pound, and recovered only to a limited extent subsequently. This break in the price of cotton contributed to the feeling of uneasiness over the inventory situation in other industries as well. However, the gyrations of the cotton market did not interfere with sustained production of textiles and the ability of manufacturers to sell their high output of standard textile products at prevailing prices.

**Business Profits.** Elimination of the excess profits tax and price increases raised business profits to record levels. Corporate profits after taxes were estimated by the Department of Commerce at \$12,000,000,000, which compared with a previous record of \$9,945,000,000 in 1943, and profits after taxes of \$9,080,000,000 in 1945. Profits before taxes were estimated at \$20,000,000,000 for 1946, little changed from \$20,875,000,000 in 1945. Profits of leading corporations in major industries compared as follows during the first three quarters of 1945 and 1946:

NET INCOME OF LEADING CORPORATIONS FOR THE  
FIRST NINE MONTHS  
(In thousands of dollars)

Industrial Groups	1945	1946	% Change
Food products.....	\$ 58,655	\$ 84,382	+43.9
Pulp and paper products.....	18,898	44,242	+131.6
Chemicals, drugs, etc.....	135,028	201,516	+49.2
Petroleum products.....	182,345	190,340	+4.4
Cement, glass and stone.....	26,474	40,803	+52.2
Iron and steel.....	122,338	174,580	+42.7
Electrical equipment.....	66,332	19,953	-69.9
Machinery.....	20,589	23,126	+12.3
Auto and equipment.....	165,450	22,360	-86.5
Other metal products.....	65,142	75,488	+15.9
Miscellaneous mfg.....	47,677	107,603	+127.6
Total manufacturing.....	908,928	983,873	+8.2
Mining and quarrying.....	44,224	50,320	+13.8
Trade (whol. and retail).....	21,181	54,340	+157.1
Service.....	7,959	11,619	+46.0
Total.....	\$982,292	\$1,100,152	+12.0

**Foreign Trade.** Foreign trade of the United States shifted during 1946 to a large extent from Government to private channels. Though exports declined sharply from the wartime level, when they reflected huge shipments of munitions and supplies abroad to our Allies under lend-lease, they were far higher than in the prewar years. A considerable part of the export total represented donations, including UNRRA shipments and supplies sent to areas occupied by American troops. Approval by Congress of a \$3,750,000,000 credit to Great Britain and loans made by the Export-Import Bank helped to maintain sales abroad.

During the first year following V-J Day, American exports aggregated \$8,800,000,000, while imports totaled \$4,400,000,000. As in domestic trade, the figures were affected by higher price level. Demand for American goods was particularly keen owing to pressing needs for reconstruction and re-equipment abroad. The United States was the one major source of supplies for a number of manufactured goods, so that this country's exports were limited chiefly by inability of manufacturers to satisfy needs and limited dollar resources of some countries abroad.

JULES I. BOGEN.

**CAMEROONS, British.** A territory in British West Africa, administered by Great Britain under a League of Nations mandate conferred on July 20, 1922. The mandated territory was one of the three African territories proposed for United Nations Trusteeship in the British *White Paper* of June 24, 1946. Area, about 34,081 square miles. Population, 831,103. On lowland plantations, cacao, rubber, fruits, and nuts are grown. Uplands produce mahogany and other timber. The mandate is administered as a part of Nigeria.

**CANADA.** A dominion of the British Commonwealth of Nations, comprising nine provinces and two territories, with a land area of 3,695,189 square miles. Population (estimated) in 1945, 12,119,000. Capital, Ottawa.

**Government.** Executive authority is exercised in the King's name by the Governor General of Canada acting through a responsible ministry. Legislative power rests in two houses: a Senate of 96 members appointed for life on a geographical basis by the Governor General, and a House of Commons of 245 members elected for five years (unless dissolved earlier) by popular male and female suffrage, on a basis proportional to the population. The nine provinces have a large measure of local autonomy, with a separate parliament and administration for each. A lieutenant governor, appointed by the Governor General, heads each provincial executive. Governor General, Field Marshal Sir Harold Alexander, assumed office April 12, 1946.

The Liberal Government returned to power as a result of the election of 1945 was headed by William Lyon Mackenzie King, Prime Minister, President of the Privy Council and Secretary of State for External Affairs. Other important portfolios included the following: Minister of Justice and Attorney General of Canada, Louis St. Laurent; Minister of Finance, James L. Ilesley; Minister of Munitions and Supply and Minister of Reconstruction, Clarence D. Howe; Minister of Agriculture James G. Gardiner; Minister of Trade and Commerce, James A. MacKinnon; Minister of Labor, Humphrey Mitchell. For changes in 1946, see below.

**Events, 1946.** Because of heavy international demands on the energies of Canadian leaders and on the resources of the economy the year was one of readjustment as well as one of the anticipated reconversion. Canada's prestige as a middle power was at its highest. By the end of the war the country had risen to fourth place among industrial nations and had so strengthened its financial position that it was possible to extend credit to a number of foreign nations.

Diplomatic and trade representation in foreign countries was being extended. Participation in Commonwealth conferences, in the sessions of the organs of the United Nations and in the first peace conference kept Canadian officials traveling and required the discovery of new men who gave promise of skill in international negotiations.

Prime Minister King had been at home only a month after the sessions of the Commonwealth prime ministers when he left again for the Paris Peace Conference, accompanied by Brooke Claxton, Minister of National Health and Welfare, and by several other officials. The Prime Minister's stay in Paris was brief, but Claxton, who remained at the conference, made clear Canada's position on the terms for Italy. Canada stood against over-harsh conditions and in favor of provisions that would give Italy a chance to recover and take her place in the world economy.

**Participation in United Nations.** Many of Canada's efforts at the meetings of the United Nations General Assembly and the committees and commissions in New York in the closing months of the year had to do with efficiency of operation, relief, disarmament and atomic energy. The leader of the Canadian delegation at the opening of the sessions was Louis St. Laurent, who had been appointed Minister of External Affairs, replacing Prime Minister King in that capacity, early in September.

On October 1 and again on December 1 Canada requested the United Nations to consider all possible means of saving time at the meetings of the General Assembly which opened on October 23. As the most important middle power, Canada apparently saw no necessity for making speeches for home propaganda purposes of the kind that large and small powers found desirable. Expenses of the delegation in New York were heavy and home duties pressed the delegates. On December 1 Canada offered a specific plan, which included the elimination of repetitious arguments, selection of the most qualified delegates to serve as committee and commission chairmen, and careful drafting of resolutions, amendments, and conventions by an expert central drafting bureau.

Canada supported the Union of South Africa in the latter's demand that India's complaint against South Africa for racial discrimination be referred to the International Court of Justice. St. Laurent made an extended speech on the subject, arguing that the South African discriminatory legislation concerned matters within the country's domestic jurisdiction.

Canada's contributions to world relief needs were praised on December 5 in the Economic Committee by Fiorello La Guardia, Director General of UNRRA, with the suggestion that Canada serve as a committee of one to draw up a plan for future action. Responding to the challenge, Canadian delegate Paul Martin offered such a plan in an amendment asking for committee study and report. In the matter of arms Canada offered a resolution calling for the reduction of armaments.

Canada was especially active in connection with the question of the control of atomic energy, as it was discussed in the Atomic Energy Commission (which included all Council members and Canada) at Lake Success. In attempting to work out a practicable compromise between the American Baruch proposal that the veto be abolished for punishment for violating the agreement and the opposing program upholding the veto, Canadian member General A. G. L. McNaughton patiently and persistently backed mediation with the offer of compromise resolutions.

**Aid to Britain.** In February, 1946, not long after the American loan to Britain was negotiated, a delegation headed by Sir Wilfred Eady of the British Treasury and Deputy Governor C. F. Cobbold of the Bank of England came to Canada to discuss the terms of a possible loan by that country. They were successful in making arrangements for a loan of \$1,250,000,000 at two percent, which was approved by the House of Commons on May 7 by a vote of 167 to 6 and by the Senate a few days later without a recorded vote. This action brought Canada's aid to Britain since the beginning of the war to more than \$5,000,000,000.

By the end of the first half-year of 1946 Canada had also made loans amounting to \$577,500,000 to France, Belgium, China, Czechoslovakia, the Netherlands, the Netherlands East Indies, Norway and Russia. The largest of the loans, all of which were made under the Export Credits Insurance Act, was

the sum of \$242,500,000 to France. Sums granted in these instances were to be used for the purchase of goods in Canada.

**Commodity Contracts.** In the early months of 1946 negotiations were going on for a long-term wheat contract with Britain. The negotiations were difficult and protracted, largely because of opposition from American wheat growers, but the three countries involved were successful in avoiding the handling of formal protests. The agreement, the completion of which was announced on July 25, provided for the purchase by Britain of Canadian wheat over a four-year period beginning August 1, 1946, on the following terms: 160,000,000 bushels for each of the first two years at a fixed price of \$1.55 a bushel; 140,000,000 bushels in the third year at a minimum price of \$1.25, with actual price to be negotiated by December 31, 1947; and 140,000,000 bushels in the fourth year at a minimum price of \$1.00, with the actual price to be negotiated by December 31, 1948.

The contract was actively opposed by Canadian wheat growers, who hoped that the 1946 high price of wheat would be permanent. In their campaign against the agreement they attempted through newspaper advertisements to make use of any existing Canadian prejudice against "British Socialism" and "colonial status" for Canada. Even after the settlement the contract was under criticism. The president of the Winnipeg Grain Exchange, George S. Mathieson, told the Empire Club of Toronto on November 7 that the contract had been entered into by the Liberal Government as a means of "weakening the forces of political opposition in the West."

Replying to such charges as these, the Minister of Agriculture, James G. Gardiner, dealt with the wheat price question in an address to the Agricultural Institute of Canada in Montreal on December 17. Gardiner showed the low returns to growers under such control schemes as those in force in Argentina and Australia and reminded his audience of the price drop from \$2.22 to 93 cents after World War I, the distress of the growers at that time and the heavy burden laid upon the nation's taxpayers for subsidizing the wheat growers in the depression.

An Anglo-Canadian beef contract providing for the sale to Britain of a minimum of 120,000,000 pounds of Canadian beef in 1947 was announced by the Agriculture Department on October 9. The agreement covered a maximum at the same amount in 1948. Other special contracts for the sale of commodities to Britain included flax, eggs, apples, peas, beans, raspberry pulp, plum pulp and newsprint.

**Relations with the United States.** The dissolution of the joint United States-Canada War Production Board, which since 1941 had coordinated the industrial output of the two countries for war purposes, was announced on January 12 in a joint statement by Prime Minister King and President Truman. On April 8 announcement was made of an agreement authorizing the sale to Canada for \$12,000,000 of defense installations and equipment placed in Canada by the United States. The list was made up of installations and equipment along the Alaska Highway, weather stations in north-eastern Canada and surplus movable property, including naval and air equipment provided to Britain under lend-lease arrangements and left in Canada. The United States agreed to make available to Canada additional surplus equipment costing not more than \$7,000,000 to be used in training Canadian armed forces.

Prime Minister King arrived in Washington on October 27 for his first conference in more than a year with President Truman. Reporting on the conference, as well as on his visit to the General Assembly of the United Nations in New York, King declined to give his cabinet on October 29 details of the Washington meeting except to say that it was "long and interesting."

**Espionage Investigation.** Through much of the year the government and the courts were occupied with an espionage investigation concerning Canadian citizens acting in behalf of the Russian Government. Little news reached the public until February, 1946, but detailed information as to earlier events was contained in the reports of the Royal Commission on Espionage established at that time.

According to the 733-page report of the Taschereau-Kellock Royal Commission published in June, 1946, it was on the night of September 5, 1945, that Igor Gouzenko, a cipher clerk in the Soviet Embassy in Ottawa, took to Canadian authorities a series of documents to prove that "public officials and other persons in positions of trust or otherwise have communicated, directly or indirectly, secret and confidential information, the disclosure of which might be inimical to the safety and interests of Canada, to the agents of a foreign power." Gouzenko, who had been favorably impressed by the democratic methods used in Canada, told the Commission that the fact that Russia was preparing for a third world war was freely talked about at the Russian Embassy in Ottawa.

Texts of two orders-in-council dealing with espionage were made public on February 28, 1946. The first, dated October 6, 1945, stated that the Canadian Government had knowledge of such activities and ordered detention of persons involved according to the discretion of the Acting Prime Minister or the Minister of Justice. The second, signed on February 5, 1946, empowered the Royal Commissioners to make interim reports on matters related to the subject, together with the evidence and the findings on that evidence. The Royal Commissioners were Justice Robert Taschereau and Justice R. L. Kellock.

Counsel for the Royal Commission announced on February 23 that oral and documentary evidence confirmed the serious nature of the disclosures, and that eleven men and two women were under detention in connection with the leakage of information to a foreign mission. In the course of the year persons found to be implicated were charged and appeared before various courts in Canada.

Dr. Alan Nunn May, a British temporary civil servant who was in a research group that came to Canada and worked at a Montreal laboratory, was tried in Britain and sentenced to ten years in prison. He was known in the communications with Moscow as "Alek." James Benning, an official of the Canadian Department of Munitions and Supply, was given a five-year term by the Ottawa Supreme Court. Benning was credited with supplying the Russians with seventy documents including notes and reports on the North American Coordinating Committee.

Other persons charged included Fred Rose, Labor-Progressive member of Parliament for Montreal-Cartier, who lost an appeal and on December 20 was sentenced to six years in the penitentiary on the charge of violating the Official Secrets Act; Agatha Chapman, Bank of Canada economist and English-born great-granddaughter of Sir Charles Tupper, one of the fathers of Confederation, who was acquitted, and Harold S. Gerson, employed in

the Department of Munitions and Supply, who received a five-year sentence. Eighteen persons in all were charged in 1946, nine were sentenced and five were acquitted.

The Royal Commission found that a "Fifth Column" existing in Canada was organized and directed by Russian agents in Canada and Russia and that within it there were several spy rings. It found that the major part of the information transmitted to the Russians was through the agency of Canadian public servants, highly educated men and women, working under oaths of allegiance. Persuasion was accomplished in most cases, as in the case of scientists employed at the National Research Council in Ottawa, by inducing them to join discussion groups for the study of Communism.

**Ministerial Changes.** A number of important changes in cabinet and diplomatic posts were made in 1946. When the King's New Year's honors list was published at the beginning of the year the names of J. L. Ilsley, Minister of Finance, and Louis St. Laurent, Minister of Justice, were added to the small and select list of Canadian members of the Imperial Privy Council.

On April 2 the House of Commons approved a bill to establish a separate Ministry of External Affairs, to which Louis St. Laurent was appointed as Minister on September 4, succeeding Prime Minister King, who had served both as Prime Minister and External Affairs Minister. Announcement was made at the same time of the appointment of Norman Robertson, Under-Secretary of State for External Affairs, as High Commissioner to the United Kingdom, of Ambassador to Washington L. B. Pearson to succeed Robertson, and of Hume Wrong, Associate Under-Secretary for External Affairs, to succeed Pearson.

Further changes were made early in December. Finance Minister J. L. Ilsley was made Minister of Justice, a move which made it possible for St. Laurent to give all his time to External Affairs; and Defense Minister Douglas Abbott was appointed Finance Minister. National Health and Welfare Minister Brooke Claxton succeeded Abbott as Defense Minister and Secretary of State Paul Martin was transferred to National Health and Welfare. Air Minister Colin Gibson was named Secretary of State. The defense forces, army, navy, and air, were unified under the Ministry of Defense headed by Claxton. In the course of the year many changes were made in the higher posts of the foreign service.

**Parliamentary Session.** The second session of the 20th Parliament, opened on March 14 by the Duke of Athlone (shortly to be succeeded as Governor General by Viscount Alexander) and ended on August 31, was long and fruitful. Its achievements included the approval of the loan to Britain, the establishment of Canadian citizenship and preparations for the adoption of a Canadian flag, work on the extension of foreign exchange control and application to the United Kingdom Parliament for a constitutional change involving the redistribution of seats in the House of Commons.

Prime Minister King's Liberal Party had a slender majority in the House of Commons, but this was raised to five with the victory of a Liberal candidate in the by-election in Richelieu-Verchères (Quebec) in December. The unique position occupied by King in Canadian public life was emphasized at a dinner given him on June 18 by members of Parliament and the Parliamentary Press Gallery on June 18. Between December 29, 1921 and June 10, 1946, King was in office for nineteen years, passing by a few days the record formerly held by

the Conservative leader, Sir John A. MacDonald.

**Flag and Citizenship.** Early in the 1946 session of Parliament a joint Commons and Senate Committee was set up to deal with the design for a Canadian flag. The committee handled more than 2,000 designs, meeting opposition, especially from Quebec, on those which included the Union Jack. The flag recommended contained the Union Jack "covering between one-fourth and one-ninth of the total flag area," and the matter was finally put over until the next session of Parliament.

The status of Canadian citizenship was at last clearly defined in the 79th year of Confederation by the 1946 Parliament. The law provided that beginning on January 1, 1947, citizens of Canada would be officially known as "Canadians" and their passports would bear the words "Canadian citizen" instead of "British subject."

**Dominion-Provincial Relations.** By means of a shift of plan some progress was made in the field of Dominion-Provincial fiscal relations, although many difficulties were met and considerable friction was engendered. The background was the publication of the Report of the Royal Commission on Dominion-Provincial Relations (the "Rowell-Sirois Report") in 1940, the agreement announced on January 15, 1942, by which the Dominion Government had a monopoly of personal income and corporation taxes, as well as succession duties, until a year after the end of the war, paying compensation to the provinces (see YEAR BOOK for 1942, p. 114), and a series of unsuccessful conferences.

In August, 1945, the Dominion proposed a three-year agreement with the provinces, under which the Dominion would keep these taxes and reimburse the provinces with a \$12 per capita subsidy, to rise with increases in the population and national income. The Coordinating Committee of the Dominion-Provincial Conference, established in the preceding August, met in Ottawa in January, 1946, to work out revisions. The Committee consisted of Prime Minister King and the premiers of the nine provinces. The conference was not regarded as a failure, although Premier Drew of Ontario continued to insist on autonomy for Ontario, Premier Duplessis of Quebec appeared to take a somewhat similar position, and the rest of the provinces presented a far from solid front.

Another in the lengthy list of Dominions-Provincial conferences expired on May 3, after five days of meeting, because of the failure of the ten governments even to approach agreement. The Quebec premier left earlier, and a flare-up between Premier Carson of Manitoba and Premier Drew of Ontario followed. Ontario and Quebec were still obdurate and the demands of the other provinces were still varied. The conference adjourned *sine die* and neither Prime Minister King nor Finance Minister Ilsley would answer a query as to whether there would be other attempts at agreement.

Shortly after this adjournment Drew began to plead for further conferences, but without result. Premier Carson of Manitoba, speaking before the Council of Social Agencies of Winnipeg on June 3, said that Drew's large demands from the Dominion were the "immediate occasion" of the suspension of the conference.

**Revised Dominion Proposals.** In the budget put before the House of Commons on June 27 a revised Dominion offer of \$15 per capita, first made in the preceding January, was the highlight of the otherwise undramatic financial statement. Payment would be adjusted to changes in population and gross national production. Income and corporation taxes (with some slight exceptions for the latter)

would go to the Dominion, and such provinces as levied succession duties would accept appropriate reductions in payments from the Dominion. The term of the agreements would be five years.

In reply to further attacks on the central government by Premier Drew of Ontario, Prime Minister King made public on October 18 a letter he had sent to Drew, saying that the people of Canada had not forgotten the circumstances which occasioned the adjournment of the conference in May, and that it was the situation revealed there which caused the Dominion to feel that it would be inadvisable to have a conference until the provinces indicated their attitude towards the proposals.

The Dominion therefore proceeded to make agreements with the separate provinces, a process which drew further attacks from Premier Drew. Manitoba, Saskatchewan and New Brunswick concluded agreements early, and by December terms with Alberta, British Columbia, Nova Scotia, and Prince Edward Island were ready, so that it appeared that when Parliament opened in January, 1947, only Ontario and Quebec would be left.

**Reconversion.** By the closing quarter of the year Canada appeared to have passed beyond the stage of reconversion unemployment. In the preceding March, when demobilization was at its height, the unemployment index was also carried to its post-war peak. By November 1, however, unfilled vacancies had caught up with the number of applicants. Employment set a peacetime high in September, 1946.

The intervening months were stormy. With respect to strikes Canada had the worst summer in her history, leaving 1919 in second place with respect to the number of man-hours lost. The most disrupting strikes were in basic steel plants, aggravating the already acute shortage of steel and slowing the production of cars, farm machinery and houses. The strikes in three important steel plants lasted from July 15 to the first week in October. A maritime strike, beginning in late May, tied up ships for four weeks and strikes occurred in a number of other key industries.

**Relaxation of Controls.** In spite of the relaxation of some of the war controls, Canada took steps in 1946 to protect her price levels as far as possible from the influence of rising prices in the United States. The outstanding action was the announcement in the House of Commons on July 5 of the restoration of parity between the Canadian and the American dollar, together with the presentation of related measures for the safeguarding of Canadian prices.

Wage and salary controls were removed on November 30. A number of price increases were approved during the year and a number of subsidies removed. The increase in the cost-of-living index during the year was held to about 7 percent.

**Agriculture.** Canada is an important agricultural country, with an estimated value of field crops in 1946 of \$1,238,000,000. Wheat, estimated at 418,000,000 bushels in November, 1946, is the leading crop. Other important products of the land are the remaining staple grains, animal products, lumber, and furs. The country is an important producer of water power.

**Industry.** Manufacturing increased rapidly in the war years and by 1944 mechanical transport and aircraft had become the leading war industries. Non-ferrous smelting and refining (\$511,000,000), chemicals, meat products, shipbuilding, iron and steel products, automobiles, pulp and paper, and aircraft were in that order the leading groups of

industries in 1943. Gold and copper, to the value of \$118,000,000 and \$65,000,000 respectively in 1944, are mined in considerable amounts.

**Foreign Trade.** In the ten months ended with October, 1946, total foreign trade (\$3,437,000,000) was higher than for any comparable period before 1943. Exports amounted to \$1,890,000,000 and imports to \$1,547,000,000, producing an excess of exports of \$343,000,000. A conspicuous factor in the trade of the year was the return to an unfavorable balance of trade with the United States. There was still a favorable balance of trade with countries other than the United States and exports to the West Indies and the countries of South America were on the increase. A sizeable proportion of Canada's exports to countries other than the United States was financed by export credits, while imports from the United States were paid for in cash, so that the deficit with the United States created a problem of careful financial management for the future.

**Characteristics of the Population.** Canada is a bilingual country, with 50 percent of its people of British origin and 30 percent of French origin at the time of the 1941 census. The French-speaking people live largely in the Province of Quebec, where they maintain cohesion of custom, religion, and language. The other leading national stocks are German, Ukrainian, and Dutch. Ninety percent of the people live within 250 miles of the Canadian-American border. Ontario (3,787,655) and Quebec (3,331,882) were the most populous provinces in 1941, and Montreal (903,007) and Toronto (667,457) the largest cities.

The chief religious affiliations in 1941 were Roman Catholic, United Church, Anglican and Presbyterian. The provinces have control of education, which is largely in the hands of state authorities, except in Quebec. There are six state-controlled and twelve independent universities in the Dominion.

ALZADA COMSTOCK.

**CANADA, The United Church of.** The designation applied to the single body formed by the union, in 1925, of the Congregational, Methodist, and Presbyterian churches in Canada; the Methodist churches of Newfoundland and Bermuda are also included. In the year of 1945 there were in Canada, Newfoundland, Bermuda, 6,784 preaching places (including home missions) in 2,710 pastoral charges; 749,374 communicant members; and 1,771,966 persons under pastoral care. A total amount of \$16,021,138 was raised for all purposes. At the Twelfth General Council held in Montreal, Quebec, in September, 1946, the Rev. T. W. Jones, D.D., was chosen moderator for the ensuing biennium. Rev. Gordon A. Sisco, M.A., D.D., is general secretary. Headquarters: 521 Wesley Building, Toronto 2B, Ontario, Canada.

**CANTON ISLAND.** An atoll of the Phoenix group (3° to 5°S. and 170° to 175°W.) in the central Pacific which with Enderbury Island of the same group is under the joint control of Great Britain and the United States (Anglo-U.S.A. Pact of Aug. 10, 1938, and Notes of Apr. 6, 1939). Canton is 29 miles in circumference and has a land mass of from 50 to 600 yards wide which encloses a lagoon 9 miles in diameter. Enderbury is 2.5 miles long and 1 mile wide. Canton was a port of call on Pan American Airways' transpacific air service from Honolulu to Auckland, New Zealand, which commenced on July 12, 1940. Early in 1942 United States armed forces were stationed on the island,

which became an important link in the air transport route to the battle fronts of the southwestern Pacific and a base for air patrol operations.

**CARNEGIE ENDOWMENTS.** Carnegie Corporation of New York. Established by Andrew Carnegie in 1911 for the advancement and diffusion of knowledge and understanding among the people of the United States and the British Dominions and Colonies, this Corporation has a basic endowment of more than \$135,000,000, of which \$10,000,000 is applicable in the British Dominions and Colonies. Its income only is subject to appropriation by the Trustees.

During the year ended September 30, 1946, the Corporation appropriated \$3,086,385 for other Carnegie agencies, for research, study, and publication, and for various purposes of colleges and universities. Of this amount, \$212,500 was devoted to activities connected directly with the war effort, thus making a total of \$2,984,367 granted for such purposes during 1940-46.

The Trustees of the Corporation are: Thomas S. Arbutnot, W. Randolph Burgess, Vannevar Bush, Oliver C. Carmichael, William Frew, Henry James, Devereux C. Josephs, Nicholas Kelley, Russell Leflingwell, General George C. Marshall, Margaret Carnegie Miller, Frederick Osborn, Arthur W. Page, and Elihu Root, Jr.

The officers of administration are: Devereux C. Josephs, president; Robert M. Lester, secretary; C. Herbert Lee, treasurer; and Ernest A. Farintosh, comptroller. Office: 522 Fifth Avenue, New York 18, New York.

**Carnegie Endowment for International Peace.** Founded by Andrew Carnegie in 1910, the endowment consists of a trust fund of \$10,000,000, the revenue of which is to be administered to hasten the abolition of international war. The work is carried on in three Divisions: (1) Division of Inter-course and Education; (2) Division of International Law; (3) Division of Economics and History.

A special library containing 75,000 volumes on all aspects of public international relations is maintained in Washington. During the fiscal year ended June 30, 1946, the Endowment's income amounted to \$555,475, which included a grant of \$100,000 from the Carnegie Corporation of New York. During this period, the Endowment expended \$550,072, which included expenditures from balances brought forward from previous years. The officers are: President Emeritus: Nicholas Murray Butler; Acting President: John W. Davis; Secretary: George A. Finch; Treasurer: Eliot Wadsworth. Administrative offices and the Division of International Law are at 700 Jackson Place, Washington 6, D.C. The other Divisional offices are at 405 W. 117 St., New York 27, New York.

**Carnegie Foundation for the Advancement of Teaching.** The foundation established in 1905 by Andrew Carnegie, who gave an endowment of \$10,000,000 for paying retiring allowances and widows pensions in the United States, Canada, and Newfoundland and for various other purposes in the field of higher education. Incorporated by Act of Congress in 1908, the Foundation received a further gift of \$5,000,000 from Mr. Carnegie and appropriations totaling \$13,250,000 for endowment and reserves from Carnegie Corporation of New York. On June 30, 1946, its resources amounted to \$16,272,269. In 1945-46, it disbursed \$1,879,686 for allowances and pensions. It awards no scholarships or aids of any kind. The Foundation's Annual Reports and Bulletins deal with many phases of higher education. In 1946 its principal studies concerned the educational appraisal of individuals

through new-type tests and testing, particularly at the graduate level. Oliver C. Cromwell is President of the Foundation, and Howard J. Savage Secretary and Treasurer, with offices at 522 Fifth Avenue, New York 18, New York.

**Carnegie Hero Fund.** A Fund established in 1904 by Andrew Carnegie to help those who have risked their lives to an extraordinary degree to save human life or to aid dependents of rescuers who have lost their lives in the performance of their acts. The original endowment was \$5,000,000; the amount expended to September 30, 1946, \$6,815,405. Dr. Thomas S. Arbutnot is President and Mr. C. B. Ebersol is Assistant Secretary and Manager of the Fund, the address of which is 2307 Oliver Building, Pittsburgh 22, Pennsylvania.

**Carnegie Institute,** located in Schenley Park, Pittsburgh 13, Pennsylvania, founded and endowed by Andrew Carnegie in 1896, houses under one roof the central branch of the Carnegie Library of Pittsburgh, with special departments covering technology, art, and music; the Department of Fine Arts, with a representative and growing collection of modern painting and sculpture, and with the distinction of having the only annual international exhibition of paintings in the world; the Carnegie Museum, covering the natural sciences and applied arts; and the Carnegie Music Hall, where from October to July free organ recitals are given on Saturday evenings and Sunday afternoons. The Carnegie Institute building, a modification of the Italian Renaissance style, covers about four acres, and stands among the world's great works of architecture. Officers: President: William Frew. Vice President: Roy A. Hunt. Secretary: Augustus K. Oliver. Treasurer: Thomas L. Orr.

**Carnegie Institution of Washington.** An organization founded in 1902 by Andrew Carnegie "to encourage in the broadest and most liberal manner investigation, research, and discovery, and the application of knowledge to the improvement of mankind." Income on investments for the year 1945 amounted approximately to \$1,300,000.

Organization of the normal research program of the Institution remains much as described in YEAR BOOK for 1941. Due to the war emergency, however, the entire resources of the Institution including laboratory facilities and personnel have been made available to the U.S. Government, and most of the Institution's long-time projects have been temporarily deferred in lieu of war research contracts with the Government. The President of the Institution is the Director of the Government's Office of Scientific Research and Development. Now that the war is over the Institution expects to return to normal ways as soon as possible, preceded by discussion and formulation of future research programs.

Walter S. Gifford is Chairman of the Board of Trustees of the Institution, and Vannevar Bush is President. Other Trustees are: James F. Bell, Robert Woods Bliss, Lindsay Bradford, Frederic A. Delano, Homer L. Ferguson, W. Cameron Forbes, Herbert Hoover, Frank B. Jewett, Ernest O. Lawrence, Alfred L. Loomis, Roswell Miller, Henry S. Morgan, Seeley G. Mudd, Henning W. Prentiss, Jr., Elihu Root, Jr., Henry R. Shepley, Richard P. Strong, Charles P. Taft, Juan T. Trippe, James W. Wadsworth, Frederic C. Walcott, and Lewis H. Weed. Headquarters: Sixteenth and P Streets, N.W., Washington 5, D.C.

**CATHOLIC CHURCH IN THE UNITED STATES.** Statistics. Membership in the Catholic Church in the United States in 1946 totalled 24,402,124, according to fig-

ures given by the *Official Catholic Directory*. A record total of 18,667 Catholic parishes are in operation, with 13,667 of them having resident pastors. There are, in addition, 5,124 chapels, and 5,084 mission churches.

There were 166 members of the American hierarchy presiding over 101 dioceses and 22 archdioceses. These also include for statistical purposes as American dioceses: The Vicariate-Apostolic of Alaska; Honolulu, Hawaii; the Abbatia Nullius of Belmont Abbey, N.C., as well as the Pittsburgh (Greek Rite) and the Ukrainian Greek Catholic Diocese.

The number of ordained clergymen—38,980—is the highest on record. There are 25,567 diocesan priests and 13,060 religious order priests. Among professed religious, the number of Sisters has increased to 139,218 and the number of Brothers to 6,721.

Elementary parish school pupils have increased by 41,190 to 2,070,202. Parish high school enrollments are 301,339, an increase of 22,720 over 1945. The number of seminarians has increased by 1,427 to 22,950.

A total of 87,430 converts entered the Church during the year. Infant baptisms numbered 792,987, and the total number of deaths as 256,433, a decrease of 8,314.

The total number of American youths under Catholic instruction was 3,451,735, an increase of 245,931. One hundred and ten new institutions bring the total of Catholic general hospitals to 794, with a total bed capacity of 86,919.

The number of patients treated annually in general hospitals totals 3,339,239, an increase of 43,418 over 1945 figures, and those treated in special hospitals and sanatoria, 58,687.

There are 45,219 children in 365 Catholic orphanages and infant asylums, and 19,308 children in foster homes.

**Bishops' War Emergency and Relief Committee.** The Bishops' War Emergency and Relief Committee was organized in 1940 as a centralized agency to meet war emergencies as well as relief needs of people suffering the devastation of war. A total of \$2,500,000, raised in Catholic Churches throughout the United States, and distributed mainly through the Vatican on the basis of greatest need, continued to provide general relief to war victims, prisoners, refugees, and the homeless. Allotments were made to help relieve suffering and distressed victims of war, men, women, and children, from Poland, China, Belgium, France, Holland, the Scandinavian and Baltic countries, Greece, and a dozen other war-torn lands. Grants were also given toward the maintenance of Montezuma Seminary located near Las Vegas, New Mexico, where Mexican candidates for the priesthood are being educated. Aid was given to refugees here and abroad through the Catholic Refugee Committee in New York.

**War Relief Services.** War Relief Services—National Catholic Welfare Conference administers a program of relief and assistance to refugees, victims of war, prisoners of war, and merchant seamen in the United States and more than forty foreign countries. Records show that nine campaigns conducted by War Relief Services—N.C.W.C. from this date to May 1946 enabled the organization to administer over \$70,000,000 worth of relief goods during this period. Efforts were redoubled during 1946, in response to a plea of Pope Pius XII that the entire Catholic world mobilize to save Europe's war-stricken, especially the young.

In May, again in response to a plea from the Vatican to combat famine in war-ravished lands with-

out discrimination, a "Food For Children of Europe and the Far East" campaign was conducted in 15,000 Catholic parishes throughout the United States. This drive resulted in the collection of thirty million cans of food—ten million excess of the original goal. Over 8,900,000 pounds of this were shipped to twelve countries in Europe and the Far East during a six-week period ending in July, and one million and two hundred thousand pounds of canned foods were dispatched later to Poland, Greece, and Italy—countries where destitution was reported to be most widespread.

Relief channels to Germany were opened early in the year by authorization of President Truman, and War Relief Services arranged to supply one shipment a month, each consisting of 2,000 tons of food, clothing, and medical supplies for needy German civilians. Relief for Austria was also inaugurated with the shipment of 1,028,987 pounds of supplies. To aid India's starving millions, War Relief Services expedited the shipment of 1,000,000 pounds of flour.

Supplies in the amount of 3,900,000 pounds were reported en route to Germany in July 1946, and in the following month, War Relief Services announced the assignment of 250,000 pounds of whole wheat flour for the relief of people in North Africa. By October, more than 6,000,000 pounds of goods in all had been consigned to Germany, for distribution in the American, British and French zones.

A nation-wide campaign was launched in October 1946 for a minimum of \$5,000,000 to carry on foreign relief work, as well as the allied activities of the Bishops' War Emergency and Relief Committee. A "Clothe the War Stricken" campaign was held during December in twenty-five dioceses in areas most readily accessible to New York and San Francisco warehouses of War Relief Services. During the fiscal year October 1945—September 30, 1946, relief shipments weighing 55,187,224 pounds and valued at \$15,325,388 were made. At that time War Relief Services—N.C.W.C. had made 678 shipments to 36 countries—a total of 71,231,855 pounds, with a total value which amounted to \$21,963,051.

**Annual Meeting of the American Hierarchy.** On November 13, 1946, 124 members of the Hierarchy in the United States assembled at the Catholic University in Washington, D.C., for their 1946 general meeting, and continued in session for three days. At the close of their meeting the Bishops issued a statement entitled "Man and the Peace," which was signed in their names by the Administrative Board of the National Catholic Welfare Conference.

**The Catholic Press.** The Catholic Press showed a total circulation of 10,654,918, a gain of 1,500,000 in three years. Special projects of Catholic news coverage included the consistories at Rome in February 1946, the work of special foreign correspondents, syndicated material, and the inauguration of more popular features. Seven new Catholic publications were launched during the year. Publications in 34 countries now subscribe to the NCWC News Service, while "Noticias Catolicas," the Spanish-language news service, serves over 60 papers in 18 countries.

Compilation of war records shows notable service on the part of Catholics, both in the armed forces, and in civilian industries in World War II. The first chaplain in the nation's history to receive the country's highest honor, Father Joseph T. O'Callaghan, S.J., of the Navy, received the Congressional Medal of Honor from President Harry S. Truman.

**CENSUS, Bureau of the.** A branch of the U.S. Department of Commerce which serves as the fact-finding agency of the Government. It conducts the decennial census of population, the quinquennial census of agriculture, foreign trade and vital statistics reports, data on local governments, etc. Director: James C. Capt.

**CEYLON.** A British self-governing colony, south of India. Area, 25,232 square miles. Population (1944 estimate), 6,384,000. Capital, Colombo (310,000 in 1936). Although a change of government was imminent, Ceylon was still administered in 1946 by a Governor assisted by a State Council of 61 members, 50 of whom were elected.

**Population.** More than one-half of Ceylon's population of approximately 6,384,000 are Sinhalese (3,500,000). Immigrant Tamils from southern India were estimated in 1944 at 642,540. There were also 325,000 Moors, 35,000 Dutch and Portuguese mixed with native strains, and 10,000 Europeans. Buddhism is the religion of the majority of the inhabitants. Education is free in Sinhalese and Tamil schools, but fees are paid for the English schools. In 1944 the enrollment was 768,134, of whom about two-fifths were girls. The University of Ceylon, established in 1942, has an associated medical college of long standing.

**New Constitution.** In conformity with the recommendations of the Commission on Constitutional Reform in Ceylon (the Soulbury Commission) the British Government issued a *White Paper* on October 31, 1945, offering a new constitution. This was accepted by the ministers of state, and on May 15, 1946, the King made an order in council embodying the new constitution. The plan provided that the State Council should be replaced by a Parliament consisting of a Governor, representing the King, and two chambers, a Senate and a House of Representatives. A Cabinet, one member of whom is to be Prime Minister, will be charged with the general direction and control of the island and will be collectively responsible to the Ceylon Parliament. Certain matters relating to defense, external affairs and serious racial or religious conflicts are reserved for decision by the British Government.

The announcement had a better reception in Ceylon than the discussion at the time of the visit of the Soulbury Commission to Ceylon had led observers to expect. The only serious signs of disaffection came from the indigenous Tamils of Indian origin and Indians resident in Ceylon. The president of the Indian Mercantile Chamber of Ceylon issued a statement saying that the arrangements sanctioned the discriminatory treatment already accorded by Ceylon to the Indian community. The Sinhalese majority welcomed the Constitution and hoped for dominion status within a short time, as the order in council suggested.

**Economic Difficulties.** Tea and rubber, the mainstays of the Ceylonese economy, caused some anxiety in 1946. In June some 86,000 Indian tea workers struck, under the direction of the Ceylon Indian Congress, against an alleged denial of civil rights to Indians. Under a new village expansion scheme the Ministry of Agriculture was buying tea estates and giving them to landless Ceylonese villagers on a cooperative plan. Indian laborers already on the first estate bought refused to leave, and Indians on private estates struck in sympathy. The strike appeared to be political, for it began on rubber estates but was transferred to tea where the crop could be more easily harmed by neglect.

The Ceylon Government was unwilling to renew

for 1947 the agreement with the British Ministry of Food for the bulk purchase of tea. Sir Oliver Goonetilleke, Financial Secretary of Ceylon, told the State Council in November that "for the first time in history the Ceylon Board of Ministers stood up against imperialism and vested interests" in refusing the agreement. Ceylon intended to renew free auctions and to levy a heavy duty on all exports of tea.

The rising costs of labor in Ceylon, springing in part from a desire for a higher standard of living, hampered Ceylon's competitive position in rubber as well as in tea. Malayan rubber could be produced more cheaply and the threat of synthetic rubber was always in the background. Sir Oliver Goonetilleke argued in the State Council in November that Britain and the United States fixed rubber prices wholly without reference to the human element in production.

**Production and Trade.** Although tea (£20,715,379) and rubber (£14,852,763) were the chief exports in 1944, copra, coconut oil, and a number of other vegetable products were also important. The United Kingdom is Ceylon's chief tea market. Cotton manufactures, rice, sugar, coal, and coke were the large imports.

The island has about 3,650,000 acres of land under cultivation, with coconuts (1,238,000 acres), rice, rubber, and tea using a high proportion. In recent years the Department of Commerce and Industry has been active in establishing factories, in an attempt to process on the island many of Ceylon's products.

ALZADA COMSTOCK.

**CHEMISTRY.** The year 1946 will stand out in chemical circles as one in which great advances have been recorded. These unusually fruitful developments have resulted from a combination of circumstances. First, there has been a flood of information concerning the advances which have been made behind the curtain of war-time secrecy. Many of the products and processes about which there were only vague hints have been revealed in full and their adaptation to peace-time uses have been suggested. Second, the various Commissions which have been sent to Europe to study new developments have made preliminary reports and many of the processes and much of the equipment will be useful in American practice. A third influence of no small importance is the stimulation to research resulting from the experiences of the previous five years. Many concerns which formerly supported no research laboratory have come to realize that some organization of this kind is necessary if progress is to continue. A recent estimate has stated that the annual expenditure for chemical research in this country is now \$500,000,000. As a result of these influences and the general stimulation to trade which has followed the war, there has been a bewildering deluge of new products and processes, as well as new developments in well established industries. One result of this increased activity is to stress the shortage of trained chemists. Mr. William S. Richardson, President of the B. F. Goodrich Chemical Company, estimates that "we have need on this continent for a minimum new crop of 10,000 men with degrees in chemistry per year." It is hoped that the increased enrollment in the colleges will, in time, supply this need.

**Metals.** The metals and their compounds have continued to be important. Nearly all of the metals have been removed from priority requirements, but some are still in short supply and probably will continue to be scarce for some time to come.

**Magnesium and Aluminum.** These light metals have been very plentiful. All the magnesium-producing plants were closed during the early part of the year. The Dow Chemical Company announced its intention of resuming production in the early fall, and reports from the Pacific Coast indicate that Permanente is determined to resume production of magnesium metal in spite of the cost of the process. Some improvements have been made with the purpose of decreasing the cost of production.

A new type of magnesium blasting powder is being developed and tested by the Permanente Metals Corp. It is claimed that the new explosive is insensitive to shock, is not ignited by a spark, and is not detonated by a flame. The magnesium dust in the blasting powder is obtained from Permanente's carbothermic process. It has been used successfully in the company's limestone quarry where it is claimed that it is more economical than the usual blasting powders.

The problem of obtaining aluminum from clay continues to attract attention of Western producers since bauxite is not available in this area, and excellent deposits of clay are at hand. It is thought that aluminum may be produced on the West Coast by extraction from clay. A number of plants have produced high grade alumina. One of the most promising methods uses ammonium bisulfate as the active agent. The process, however, involves several distinct steps, and its success seems still to be somewhat doubtful.

A new aluminum oxide abrasive has been announced by the Norton Company, Worcester, Mass. The process consists of the fusion of pure aluminum ores in an electric furnace in such a way that separate crystals of aluminum oxide in commercial sizes are formed in a fluid matrix. The crystals are removed from the matrix by a continuous chemical process; they do not require crushing, but after screening for size they are bonded as desired for use. On account of the purity of the crystals the bond is secure and the favorable angles give the wheels high efficiency in cutting and long life in use.

**Tin.** Tin continues to be scarce and although the outlook for relief is good, efforts are still being made to conserve the supply. The Chrysler Corporation has announced methods of saving tin which involve the use of tinless body-solder and reduction in the amount of tin in the other body parts of their cars. A device which has been popular with British manufacturers of radio and electrical equipment uses a coat consisting of 80% tin and 20% zinc for sheet metal. This coating is said to give excellent satisfaction. There is still much interest in the use of aluminum as a replacement for tin in food containers, cigarette packages, collapsible tubes, and wrapping foil. The American Can Company has announced the successful manufacture of aluminum cans for many food products, paints, and cleansers.

**Lead.** Lead continues to be one of the most difficult metals to obtain. For the last quarter of 1946 the allotment of lead was cut a little more than 8% under that of the third quarter. The shortage of lead is felt particularly in the manufacture of tetraethyl lead, insecticides, and lead storage batteries. Supplies of lead have been refused to newcomers in any lead-using industry.

**Cobalt.** Cobalt, ordinarily regarded as a metal of little interest, became critical early in the War because it was needed to make certain types of hard grinding tools. Nearly all the cobalt obtained in the United States was imported from the Belgian Congo and Northern Rhodesia. The supplies were

cut off, and for a time the resulting critical shortage, together with the increased price of silver, brought to life the mining interests in Cobalt, Ontario, where much of this valuable metal is now obtained. It is used as a pigment, as a steel hardening alloy in electrical appliances, permanent magnets, internal combustion motors, and jet propulsion engines.

**Cesium.** Cesium vapor lamps were prepared by the Westinghouse Lamp Division for the United States Navy during the war. The lamps permitted a two-way telephonic conversation by an invisible light beam, and were particularly useful for convoy duty and in landing operations. The device permitted secret communications and was not subject to jamming by infrared beams or static, and was unaffected by weather conditions except dense fog or smoke.

**Lithium.** Lithium, whose developments during the war have been among the most closely guarded of our war secrets is now being released for peacetime uses. Much effort has been expended on the production of the metal itself. Research was carried out under the direction of the National Research Council in an effort to supply the Army Signal Corps with lithium for the production of lithium hydride. A detailed study was made with a view to producing the metal by the use of thermic reactions instead of by the electrolytic methods which formerly had been employed.

Three new methods have been developed for the production of lithium from the native ore spodumene. In one method a reaction mixture consisting of 65% lime, 5% ferrosilicon, and 30% spodumene was reduced directly in a vacuum furnace. The product obtained gave lithium, which, on redistillation was very pure, but the yield was low because of the small amount of lithium present in the charge.

The second method consisted in calcining a mixture of lime and spodumene, then leaching the product to obtain an impure lithium hydroxide solution. Lithium hydroxide was obtained by evaporation, and was then used in a mixture of 20% lithium hydroxide, 15% ferrosilicon, and 65% lime. This mixture was briquetted and reduction was obtained in a vacuum at 1100° C. When the product was distilled, a lithium of at least 90% purity was obtained.

The third method consists in treating the lithium hydroxide solution with sulfur dioxide followed by evaporation which gives solid lithium sulfite. This was then calcined with lime and reduced in a vacuum with ferrosilicon. Group figures were prepared at prices current when the research was carried out. They estimated the cost per pound of pure lithium by the direct reduction of spodumene to be \$4.20, by the reduction of lithium hydroxide, \$2.80, by the reduction of lithium oxide and calcium oxide, \$2.50. These figures are based upon the cost of materials, overhead, and amortization for the production of one ton of lithium each twenty-four hours. Since the present market price of lithium is approximately \$15 a pound, all of these prices are considerably below the present market price for this material. The first two methods have been investigated on the pilot plant scale and all of them are considered feasible.

At a recent meeting of the American Institute in New York City, Dr. Hans Osborg of the Litalloy Corp. told of some of the interesting developments which have taken place during the war years. Lithium and its compounds are now in much demand in such processes as the heat treatment of steel, (see 1945 YEAR BOOK, pages 113, 355). In addi-

tion, lithium is now used in the electrical, chemical, glass, ceramic, and optical industries as well as in aircraft and airconditioning. Dr. Osborg makes the interesting suggestion that lithium may play an important part in the development of nuclear physics. Since it lies at the opposite extreme from uranium, lithium can be used in the synthesis of other elements. The reaction of lithium and hydrogen produces lithium hydride with the evolution of appreciable quantities of heat. Dr. Osborg predicts, "when lithium is bombarded by a proton or combined with hydrogen much energy could be produced—in the order of half a million kilowatt hours for 8 grams. Otherwise stated, it would give 38,800 billion b.t.u." Several new lithium products are now available for industrial use. Lithium peroxide is a stable solid which provides approximately 35% of free oxygen by weight. Lithium borohydride is a solid which is stable in dry air, but in contact with water it generates 66 cubic feet of hydrogen per pound. Lithium diborane is a gas at ordinary temperatures and in contact with water it liberates 78 cubic feet of hydrogen per pound.

Lithium aluminum hydride,  $\text{LiAlH}_4$ , is not yet available for general use but it is promised soon. It was first made by H. I. Schlesinger and A. E. Finholt at the University of Chicago. It is readily prepared from lithium hydride and aluminum chloride. It is a white crystalline powder which has remarkable reducing effect especially upon organic compounds. The reductions take place rapidly at room temperature and the yield is excellent. Aryl nitro compounds are reduced to the corresponding azo compounds; nitriles to amines; ketones, aldehydes, esters, anhydrides, and acid chlorides to corresponding alcohols. It does not appear to attack the carbon-to-carbon double bond so it will be of particular value in the reduction of unsaturated compounds. It is also expected to be of value in the preparation of compounds containing the radioactive isotope  $\text{C}^{14}$  for use in the applications of tracer elements. In inorganic chemistry lithium aluminum hydride may be used for the direct substitution of a hydrogen atom for a halogen atom, as for example in the preparation of alkyl silanes from alkyl silicon chlorides which are available in commercial quantities. This new reagent is expected to become a valuable chemical tool in many ways.

Lithium chloride, long valued in air conditioning units, has recently found a new application of importance. During the early days of the war, the armed services felt the need for a dry cell which could operate at the low temperatures encountered in cold climates and high altitudes. The ordinary Leclanché cell is distinctly inferior at temperatures as low as  $0^\circ\text{F}$ . and is entirely unsatisfactory at  $-10^\circ\text{F}$ . By adding a solution of lithium chloride to the electrolyte in the dry cell they could be used at temperatures as low as  $-40^\circ\text{F}$ . At these low temperatures, their efficiencies were from 10% to 20% of the  $70^\circ\text{F}$ . capacity, but they were obviously superior to the old form of dry cells.

**Uranium.** Uranium and its developments have attracted much attention. New deposits of uranium ore have been reported from a number of localities, notably that in Arkansas and in France. A new plutonium process has been reported from the Hanford Works at Richland, Washington. It increases the yield of plutonium and decreases the consumption of reagents used in the process. As a result of the combined research in this field radioactive isotopes have been available in experimental quantities. Of major value so far have been  $\text{C}^{14}$ ,  $\text{P}^{32}$ , and  $\text{S}^{35}$ . The use of these as tracer elements has

already begun to give promising results, especially in the field of Biochemistry. Phosphorus 32 has been used successfully in the treatment of two types of cancer. Superficial skin tumors are destroyed by exposure to a solution of this isotope. This isotope gives off cell-killing rays of low penetrating power which are safer to use than either x-rays or radium. Iodine 131 has half life of eight days. It is used in medicine in doses in the order of millicuries, thus making it possible for several million people to be treated with a single milligram of radioactive iodine. In like manner a milligram of carbon 14 is sufficient to "tag" a ton of organic material.

The production of four transuranium elements has been reported by Glenn T. Seaborg and his associates. These include neptunium, No 93, and plutonium, No 94, which have been prominent in the discussion of the atom bomb. In addition, elements No 95, americium, and No 96, curium, have been identified. Americium has an atomic weight 241, is represented by the symbol Am, emits alpha particles and has a half-life of 500 years. Curium, Cm, has two isotopes with weights 240 and 242, and half-life periods of one month and five months, respectively. The atomic structures of these elements shows that they are built up by increasing the number of electrons in the 5f shell where americium has 6 electrons and curium has 7. This relates these new elements to the corresponding members of the rare earth group, a similarity which suggests the name "actinide" elements for the series beginning with actinium, No. 89, since they are closely analogous to the "lanthanide" elements of the rare earth group.

**Metallurgy.** Powder metallurgy of iron products should receive marked stimulation by the erection of an iron powder plant on the Mesabi range of northern Minnesota. The plant is to operate on a process developed by the late Charles V. Firth at the mines experiment station, University of Minnesota. Utilizing iron carbonate slate, an abundant waste product which overlies the iron ore of this region the plant will produce iron powder of high purity, at a stated capacity of five tons per day. The process is continuous and consists in removing the iron by acid, precipitation of iron sulfate, preferential roasting to iron oxide, and reduction under conditions which permit control of the physical properties of the product. It is claimed that uniformity and purity of the product can be guaranteed. Both these factors are important in the use of iron powder in powder metallurgy processes.

During the war a new transformer steel was needed for the improvement of radar equipment, in order to reduce the energy loss in the core and thereby to increase the range of radar and to give sharper definition of the image on the oscilloscope. The problem was solved by the production of a steel with less than 0.01% carbon and with 3-3.5% silicon. The engineers succeeded in rolling this new steel into sheets as thin as 0.003 inch and from these sheets coils were made which greatly increased the efficiency of the radar instruments. This new steel will have great influence in the development of such things as television high-frequency heating, sonic detection, and airborne electrical power systems, as well as devices needed in long-range navigation of planes, control of aircraft position by ground-based radar, the ground control of the approach of a plane in zero ceiling weather, anti-collision devices, and in many other peace-time uses.

**Alloys.** Alloys suitable for use in the most severe corrosive conditions have been necessary in war-

time activities. Two new alloys are being exploited for peace-time use: chlorimet 2 containing nickel 63%, molybdenum 32%, iron 3%, and chlorimet 3 containing nickel 60%, molybdenum 18%, chromium 18%, and iron 3%. They are claimed to be suitable for handling all concentrations of sulfuric acid, hydrochloric acid, moist chlorine, sodium chloride, acetic acid, bleach solutions, and many other corrosive chemicals. Both alloys are machinable and chlorimet 2 can be readily hardened by heat treatment. They are expecting to find their most important uses in pumps and valves.

**Corrosion.** Corrosion of the metals, especially iron, has been studied intensively during war years because of the necessity of shipping steel machines long distances into the tropical areas. Much progress has been made in preventing the corrosion of steel both in storage and in transit. Some objects have been protected from corrosion by thorough cleaning and dipping in wax and a hot bath of orthophosphates, ethylcellulose, or some similar material. The protection is effective for an indefinite period and the coating is easily removed when the machine is needed for use. Larger units like sewing machines are successfully protected against corrosion by sealing in waterproof, vapor-proof, transparent bags.

At the close of the war, the Navy was confronted with an unusually difficult problem in rust-proofing some 2,200 vessels which it was desired to keep in stand-by condition. After thorough cleaning, metal parts were wrapped in a film of plastic, which was built up by the use of spray guns. It is expected that methods developed under the stress of war-time conditions will be very useful in marketing many commercial products.

**Silicone.** Silicone derivatives are continuing to show increased usefulness because of their varied and interesting properties. Silicone lubricants for high-vacuum stopcocks are successful in holding a pressure of less than  $10^{-6}$  mm and can be maintained at a wide range of temperatures. It is claimed that there is no tendency for the stopcock to freeze. Successful use of silicone for insulation purposes permits the material to be cured at temperatures ranging from 300° F. to 500° F. Silicone paints are said to give superior service for finishes on automobiles, refrigerators, electric ranges, and hospital equipment. They are highly resistant to severe weather conditions, to acids and alkalies, and other troublesome chemicals as well as to heat. Silicone rubber is proving to be very resistant to heat and is particularly valuable for making gaskets and for electrical equipment of various sorts. Severe tests of silicone rubber which was aged for a year in a hot dry circulating oven did not appreciably change the surface hardness of the material, which also retained its flexibility and resilience for several months at 400° F. and for several days at 500° F. A new factory at Waterford, New York, is expected to reduce the costs of the silicone rubber.

A silicone compound, known commercially as D C Antifoam A, has been developed by the Dow-Corning Corp. for reducing the tendency to foam in aqueous solutions and emulsions. This material is said to be successful in eliminating or reducing foaming even when used in connection with steam or vacuum distillation. Only very low concentrations are needed, ranging from 1 part in 10,000 for badly foaming materials, to 1 part in a million for materials less likely to foam.

An extremely fine form of silicon dioxide is reported from Germany. Formed by the combustion of silicon tetrachloride, the product is useful as a

substitute for carbon black in the production of rubber as well as for thickening corrosion preventives and lubricating greases designed for high temperature use. Rubber which is compounded with the new form of silicon is not as resistant to abrasion as rubber compounded with carbon black, but in other respects is said to be equal or superior to the usual rubber product.

**Mica.** Mica, one of the most critical shortages in the early periods of the war, has been successfully produced artificially in Germany. The process, recently reported by United States investigators, consists in heating silicon dioxide with a mixture of the oxides of aluminum, magnesium, iron, manganese, chromium, zinc, and vanadium, and the silicofluorides and fluorides of sodium and potassium. The mixture is heated in graphite crucibles, either by electric means or in a gas-fired furnace. In order to produce large sheets of mica, the cooling process must be carefully controlled, especially at the critical range 1,270° to 1,230° C. At right angles to the vertical axis of the crucible, a magnetic field of 13 gauss intensity may be used to induce crystallization.

**Synthetic Sapphire.** Synthetic sapphire, formerly imported from Europe, was badly needed during the war for the manufacture of watches and other precision instruments. A new industry has been developed since the war in the preparation of suitable synthetic sapphires. The product obtained has a combination of hardness and toughness which is superior to that of any other artificial material. The sapphires are used in the production of gauges, guides, and various other wear-resisting parts. Because sapphire is said to transmit ultraviolet ray better than any other material, it is used in the ultraviolet treatment of blood plasma and serums. The industry promises to flourish because of the numerous ways in which this product can be utilized.

**Fluorine.** Fluorine, a long neglected element, has attracted much attention within recent months. At the September meeting of the American Chemical Society in Chicago, there were some 52 papers presented on various phases of fluorine chemistry. The supply of the native ore of this element has been increased by the application at the United States Bureau of Mines of a flotation process for the production of high grade fluorite. The element itself is now produced by several methods and it is available in commercial quantities. The use of Freon in refrigeration units has been popular for some time. More recent developments include the application of anhydrous hydrogen fluoride in the preparation of aviation gasoline and the use of boron trifluoride in the petroleum industry. Many fluorocarbons have been prepared and their properties studied. The use of some of these compounds as coolants has attracted a good deal of interest. Particular interest centers around polypolyfluorovinyl chloride which has advantages as a lubricant. A hydrogen fluoride torch has been developed at Columbia University. It produces a temperature of over 6,000° F.

**Chlorine.** Chlorine has always been an essential material in modern chemical industries, especially in modern warfare. As a result, much attention has been paid within recent years to the increased production of chlorine. Greatest interest in this direction attaches to the reports which have been brought back from Germany concerning the use of mercury cathodes in several types of chlorine cells. These have been studied by American electrochemists with a view to their adaptation to American industry. It is reported that the German cells have

a current efficiency of 94% to 95% and are believed to have the largest chlorine capacity of any cell now in use. An interesting report from General MacArthur's staff at Tokyo indicates that the Japanese chemists have used mercury-type chlorine cells for some time. Half of the cells used in the Japanese chlorine industry had been converted from the diaphragm type to the mercury cell. Two general types of cells were used in Japan, but they were similar in performance characteristics, such as current, voltage, and power efficiency. Both types of cells were constructed with glass or porcelain lining.

Chlorates and perchlorates are now being manufactured on the West Coast at a rate which is said to be 100 times greater than the original pre-war installation. The demand for these materials has increased tremendously during the war years.

**Seawater.** Desalting seawater has been reported during the war years, but little information has been available as to the methods by which this practical problem was solved. Recently, complete details have been published from the laboratories of the Permutit Company, New York. Under the process, which was most successful during the war, chlorides were removed from seawater by allowing a small bag of water to remain in contact with silver zeolite which was reinforced by a small amount of silver oxide. If it was desired to remove sulfates, barium hydrate was used for this purpose. The softening agents were compressed in briquet form along with a small amount of powdered activated charcoal. The desalting kit supplied to aviators and others included a vinylite-resin desalting bag. After the water had stood in the bag in contact with the softening agents for an hour or so, clear water was obtained by sucking through a filter in the bottom of the bag.

**Explosives.** Explosives naturally demanded much attention during the war. The one which has been characterized as the world's most powerful chemical explosive is known as RDX or cyclonite. It is manufactured by the nitration of hexamethylenetetramine. It is said to have 50% more power than T.N.T. and was used in the super block busters in the European operations. A peace-time use for the explosive was found in the manufacture of the smallest blasting caps ever developed. They are made of aluminum and are safer to handle than ordinary blasting caps. The stock of hexamethylenetetramine which remains is being utilized in the manufacture of plastics and medicines.

**Alkalis.** Soda ash and other alkaline materials including sodium hydroxide, sodium silicate, and sodium phosphate have been in short supply, especially during the latter part of 1946. Late in the year it was stated that the production of soda ash was about 15% below the requirements of the essential users. Therefore, steps were taken to limit new users and to produce increases where possible. The shortage of soda ash seriously affected the aluminum industry, which was attempting to meet the intense demand for material to carry out the housing program. Plans have been made to increase the capacity of the soda ash plants at Baton Rouge, La., Detroit, and Wyandotte, Michigan. But these increases cannot be expected immediately.

**Hydrogen Peroxide.** Hydrogen peroxide continues to attract favorable attention following the successful production of concentrated product both in Germany and in the United States (see 1946 YEAR BOOK, Page 107). During the current year reports from Italy describe a method of using 39% hydrogen peroxide for the sterilization of milk under

circumstances which make pasteurization difficult. For this work hydrogen peroxide was prepared by the familiar method of electrolytic oxidation of ammonium sulfate in sulfuric acid solution. The method of sterilizing milk is simple, efficient, and leaves no taste or harmful byproducts.

**Petroleum.** Petroleum has been one of the most essential materials during the war years. The petroleum industry's monumental contribution to the war effort has been called the best civilian job of the critical war period. Much of the change has been in the fields of catalytic cracking, alkylation, superfractionation, and the production of essential chemical materials in large volume. These production records have been called by Bruce K. Brown, Vice-President of the Standard Oil Company, "the largest single task in organic chemical synthesis which has yet been undertaken." The fuel product obtained was a skillfully prepared blend of which 30% consists of the synthetic hydrocarbons of the iso-octane family. The aviation gasoline produced during the war was known as grade 100-130. In the summer of 1945 the industry began the production of a super-fuel which was known as 115-145. These numbers are an extension of the original octane rating system, and they indicate the superiority of the new fuel. In the latest types of engines, this gasoline permitted a faster take-off and a longer cruising range than had ever been possible before.

Another important contribution was the production of butadiene for the manufacture of rubber. There has been rivalry between alcohol and petroleum as a raw material for the large scale production of butadiene.

Another material supplied in large volume was toluene which was used for producing fog as a protection against air raids and as a raw material in the manufacture of T.N.T. Toluene was produced from petroleum materials by distillation and catalytic dehydrogenation of methyl cyclohexane.

The petroleum industry also was called upon to produce large quantities of jet gasoline which was most effective in incendiary bombs and as fuel for the deadly flame throwers.

The drain upon our natural petroleum resources has been great during this intensive war effort. At the peak of production in July, 1945, the United Nations, excluding the U.S.S.R., reached a total production only a little less than 600,000 barrels per day. This amount was ten times the prewar capacity. The refineries in the United States produced over 87% of this total. Such an enormous drain upon one of our most important natural resources leads us to wonder how long the industry can continue on the present basis. Fears have been expressed frequently that the nation is wasting its precious raw materials and will soon face a genuine famine in petroleum and its products. Reasonable conservation is obviously essential, but some petroleum experts have called attention to the possibility of obtaining liquid petroleum products by synthesis from natural gas or from gas producible from coal. Pioneer plants have already been planned and may be expected to go into production within a few years.

**Bombs.** Incendiary bombs have been described by Dr. Ralph W. Hufferd who served as Lieutenant Colonel of Chemical Warfare Service. Various types of bombs were used. They were usually small and carried in clusters of about forty. One B-29 was able to carry as many as 4,400 bombs. Early in the war a thermite mixture was used, but later petroleum products were substituted for the incendiary material. One of the most successful thick-

ening agents used was known as "napalm." This was a peculiar aluminum soap which could be dispersed in gasoline. This material proved very useful in making incendiary bombs, and it was also extensively used as the fiery material in flame throwers and expendable gasoline tanks. Fine grain magnesium was distributed through the napalm gels and white phosphorus was added to insure ignition and reignition after being extinguished. In order to insure the most destructive use of these materials, sample villages, using the German and Japanese type of construction were built upon the desert area of Utah. The dropping of expendable tanks became quite a common practice and is credited with having protected landing troops effectively, especially at Tinian. The results of incendiary warfare were successful as is shown by the statement that "before the first atom bomb was dropped on Japan, approximately 160 square miles of the area of the leading cities had been destroyed by fire raids." The remaining stock of napalm has been transformed into soap which is useful in the Army hospitals and camps. It is somewhat germicidal in its action.

Helium has been used as a tracer gas by engineers of the United States Bureau of Mines and representatives of the petroleum industry. The purpose of the work is to determine the length of time required for helium to travel from one well to others in the neighborhood. About 100 cubic feet of natural gas are injected into the well for a week with pure helium which was added at intervals so as to produce waves of helium laden gas. Analysis of the gas in adjacent wells determines the length of time required for the helium to travel between the two wells. This permits an estimate to be made of the nature of the underground reservoir which is being flushed by the injected gas. Successful tests of this method have been carried out in the Elk Hills Field of the Naval Petroleum Reserve in Kern County, California. Other tests are being carried out in Texas.

**Alcohol.** Alcohol continues to be one of the problems of the manufacturing chemist in spite of the fact that the decrease in the wartime demand for butadiene has relieved the pressure materially. On June 27, 1946, it was announced that nine industrial alcohol plants had been closed because of a lack of molasses. Because of this continued critical situation, there has been sustained interest in the production of alcohol from other sources than grain or molasses. The plant at Bellingham, Washington, is said to be the only one in the United States which is producing alcohol from sulfite waste liquors. This plant has been in operation since 1945 and is producing about 6,500 gallons of industrial alcohol daily. Twenty-two gallons of alcohol are produced from a ton of wood pulp. Fusel oil is another product of the process. The plant at Springfield, Oregon, is designed to obtain alcohol from wood waste and is at last ready for operation after a series of delays. The raw material to be used will be sawdust and other wood waste. Some 220 tons of dried waste will be used daily which, it is estimated, will produce about 1,150 gallons of 190 proof alcohol. In addition, there will be valuable by-products. The plant uses a modified Scholler process which hydrolyzes the wood by means of sulfuric acid under pressure of 50 to 150 pounds per square inch. The resulting sugar is fermented at 86° F. The process is still expensive although under present market conditions, it is able to compete with grain alcohol. If the utilization of by-products can be developed, it may be able to continue production under ordinary market condi-

tions. The completion in 1946 of the United States Department of Agriculture's semi-commercial plant at Peoria, Illinois, gives promise of successful production of alcohol from corn cobs and other cellulosic farm wastes. It is expected to produce 90-95 gallons of liquid motor fuel from a ton of farm waste, the material being digested with sulfuric acid and the resulting sugar subjected to fermentation. The ultimate aim in the production of motor fuel is not to displace gasoline but to make an inexpensive blending material which can be used in internal combustion engines. In addition, the Peoria plant is expected to produce from farm wastes in an eight-hour day 2,000 pounds of glucose in a 10% solution, 1,600 pounds of xylose in a 15% solution, 200 pounds of furfural, and 1,000 pounds of lignin. An important question concerning this process is the cost of operation.

There is keen interest also in a new plant at Eagle Grove, Iowa, designed to produce alcohol by the use of mold instead of malt. As a result of experimental work begun nearly ten years ago in the Iowa State College, it was concluded that mold has a slight advantage over malt and can produce alcohol at a somewhat lower cost. It is believed that the development of this process will result in appreciable saving in the alcohol industries.

**Glycerin.** Glycerin is normally produced in the manufacture of soap, from which 85% of our usual supply of glycerin is obtained. Because of the shortage of fats and oils, soap manufacturers have not been able to supply the increased demand for glycerin. As a result, attention has been directed to synthetic methods of producing glycerin. One possible method is to prepare glycerin from propylene, an abundant product from the petroleum industry. The cost of the process is high, but further research and quantity production may reduce it. A plant using this method is under consideration, but has not yet been built. It is not expected that synthetic glycerin can replace the by-product from soap, but it should be able to supply any deficiency which may arise. Future demands for glycerin look promising, especially in the manufacture of alkyl resins, as a moistening agent in the manufacture of tobacco, in making dynamite, nitroglycerin, cosmetics, dentrifices, toilet articles, pharmaceuticals, adhesives, candies, beverages, and in many other applications.

**Methionine.** Methionine is one of the ten amino acids which are considered essential for growth and repair of animal tissue. The best natural sources are dairy products, fish, and liver. The medicinal form has been very expensive. A new process for the synthesis of this compound has recently been announced by the United States Industrial Chemicals and is expected to cut its cost about 97%. It will then be available for much wider use including treatment of burns, shock, exposure, serious wounds, and for all types of poisons in which the liver is involved, such as carbon tetrachloride, T.N.T., arsenic, phosphorus, and chloroform. Two French investigators have recently reported that the injection of methionine or its administration by mouth has caused a rapid increase in the red blood cells in rats which had been made anemic by carbon tetrachloride or by a diet deficient in methionine.

**Fabrics.** Mildewproofing of fabrics is claimed for chemical treatment described by the B. F. Goodrich and the Treasdale Laboratories of Pittsburgh. The material is known commercially as Perma-proof. It is claimed to render all fabrics mildew-proof, waterproof, and flameproof. It does not weaken the fabric or destroy bright colors. It may

ening agents used was known as "napalm." This was a peculiar aluminum soap which could be dispersed in gasoline. This material proved very useful in making incendiary bombs, and it was also extensively used as the fiery material in flame throwers and expendable gasoline tanks. Fine grain magnesium was distributed through the napalm gels and white phosphorus was added to insure ignition and reignition after being extinguished. In order to insure the most destructive use of these materials, sample villages, using the German and Japanese type of construction were built upon the desert area of Utah. The dropping of expendable tanks became quite a common practice and is credited with having protected landing troops effectively, especially at Tinian. The results of incendiary warfare were successful as is shown by the statement that "before the first atom bomb was dropped on Japan, approximately 160 square miles of the area of the leading cities had been destroyed by fire raids." An important question concerning this process is the cost of operation.

There is keen interest also in a new plant at Eagle Grove, Iowa, designed to produce alcohol by the use of mold instead of malt. As a result of experimental work begun nearly ten years ago in the Iowa State College, it was concluded that mold has a slight advantage over malt and can produce alcohol at a somewhat lower cost. It is believed that the development of this process will result in appreciable saving in the alcohol industries.

**Glycerin.** Glycerin is normally produced in the manufacture of soap, from which 85% of our usual supply of glycerin is obtained. Because of the shortage of fats and oils, soap manufacturers have not been able to supply the increased demand for glycerin. As a result, attention has been directed to synthetic methods of producing glycerin. One possible method is to prepare glycerin from propylene, an abundant product from the petroleum industry. The cost of the process is high, but further research and quantity production may reduce it. A plant using this method is under consideration, but has not yet been built. It is not expected that synthetic glycerin can replace the by-product from soap, but it should be able to supply any deficiency which may arise. Future demands for glycerin look promising, especially in the manufacture of alkyd resins, as a moistening agent in the manufacture of tobacco, in making dynamite, nitroglycerin, cosmetics, dentrifices, toilet articles, pharmaceuticals, adhesives, candies, beverages, and in many other applications.

**Methionine.** Methionine is one of the ten amino acids which are considered essential for growth and repair of animal tissue. The best natural sources are dairy products, fish, and liver. The medicinal form has been very expensive. A new process for the synthesis of this compound has recently been announced by the United States Industrial Chemicals and is expected to cut its cost about 97%. It will then be available for much wider use including treatment of burns, shock, exposure, serious wounds, and for all types of poisons in which the liver is involved, such as carbon tetrachloride, T.N.T., arsenic, phosphorus, and chloroform. Two French investigators have recently reported that the injection of methionine or its administration by mouth has caused a rapid increase in the red blood cells in rats which had been made anemic by carbon tetrachloride or by a diet deficient in methionine.

**Fabrics.** Mildewproofing of fabrics is claimed for chemical treatment described by the B. F. Goodrich and the Treesdale Laboratories of Pittsburgh. The material is known commercially as Permaproof. It is claimed to render all fabrics mildewproof, waterproof, and flameproof. It does not weaken the fabric or destroy bright colors. It may

be applied by dip, spray, or paint to awnings, tents, draperies, slip covers, upholstery, and rugs. Rohm and Haas, Philadelphia, also have a new mildew-proofing agent which is known as Hyamine 3258. It is quaternary ammonium pentaphenate, so it combines the antifungal properties of both the quaternary ammonium salts and the chlorophenates. A 10% water solution of the Hyamine 3258 with a little isopropanol and a wetting agent like Triton X-155 is effective in arresting fungus growths on cellar and closet walls. Tests have shown it to be particularly useful in preventing fungus growths on leather. It is being tested also for use in the protection of storage bins and containers for foods and in many other places about the home and farm. It had extensive war-time use for protecting army equipment against destructive fungi of the tropics.

Hartex Duofol L is a new and effective wetting agent which is recommended in dyeing operations and sanforizing. It is a sulfated ester which mixes with water in all proportions and is not affected by hard water, salt, alkali, all weak acids or elevated temperatures. It gives a uniformity of shade and acts as a softening agent. It is effective at concentrations as low as one ounce per two hundred gallons of solution.

**Synthetics.** Hydroquinone, the popular photographic developing medium, is now produced synthetically by a method developed in Germany and reported by United States commissioners. The process starts with aniline sulfate, which is transformed by various steps to hydroquinone. This is then purified by vacuum distillation, solution, and crystallization.

The shortage of sugar has insured a continued and intensified interest in compounds with a sweet taste. Consequently, unusual interest has attached to the reports made before various groups of American Chemists by Professor Pieter Edward Verkade of the Delft Technische Hoogeschool. During the war many compounds were studied with regard to their sweetening power. The sweetest compound reported is 1-n-propoxy-2-amino-4-nitrobenzene which is more than 4,000 times sweeter than a 1% solution of sucrose and about 8 times as sweet as saccharine. This compound was prepared by Professor Verkade who obtained it as pure orange crystals. It is stable in boiling water and weak acids. It possesses no secondary or after-taste and has been shown to be harmless when taken with the food. When used as a sweetening agent, it is recommended that it be diluted with some substance like lactose which permits the preparation of a mixture which is about 500 times sweeter than cane sugar. The new sweetening agent is being manufactured in Holland and used in several European countries. It is to be introduced into the United States.

**Drugs.** A member of the Vitamin B complex, p-Aminobenzoic acid, basis for the production of local anesthetics such as novocaine, has shown its ability as a drug in the treatment of fevers transmitted by ticks and other related insects. These include forms of typhus fever and Rocky Mountain spotted fever which are caused by the presence of small bacteria-like bodies found in lice and ticks and in the blood and tissues of patients suffering from typhus and other similar diseases. These organisms are known as Rickettsia. These rickettsial diseases are all dangerous, acute, infectious, and resist the attack of such remedies as the sulfa drugs and penicillin. They are spread by rats, mites, lice, and fleas. Laboratory tests with para-aminobenzoic acid, the name of which has been abbreviated to

"paba," show that it inhibits the growth of rickettsiae. Field tests in Egypt and India have shown that patients suffering from typhus are relieved to some extent by the use of paba. Guinea pigs inoculated with spotted fever were protected by paba.

Vitamin B<sub>6</sub>, pyridoxine hydrochloride, is to be manufactured by Merck and Company at Elkton, Virginia. The plant which is being built will cost in the neighborhood of \$1,500,000.

Penicillin has received intense study during the year 1946. The production has increased phenomenally. It is estimated that in April, 1946, the production was 300% above that of December, 1945. The estimated amount available in April was more than two million billion units, of which nearly 60% was allocated for civilian use and more than 30% for export. The manufacture of penicillin in England has kept pace with that in this country. It is reported that in May of this year, England would be able to begin the export of penicillin. The production had reached a point where a price war upon the sale of penicillin was in evidence.

The efficiency of the mold in producing penicillin has been increased surprisingly since the first British workers secured two units of the remedy from each milliliter of broth in which the mold is cultured. At the Northern Regional Laboratory in Peoria, Illinois, the yield was increased to 169 units by improving the medium in which the mold was grown. At the Carnegie Institution in Cold Spring Harbor, N.Y. the yield was further increased to an average of 369 units by treating the spores of the mold with x-rays. Some recent work at the University of Wisconsin, in which spores of the mold have been exposed to ultraviolet light, has produced strains of mold which have given as high as 904 units per milliliter. It is believed that even this high degree of productivity may be exceeded as the result of further work.

It is now recognized that the penicillin as originally prepared by broth culture was a mixture of several compounds of similar structure. As a result of the study of the structure of penicillin, at least seven different types of penicillin are now recognized, four of which are important. These four are known, respectively, as Penicillin F, G, K, and X. They all have a similar structure and differ from each other by the nature of a side chain. The general formula for all these types of penicillin may be represented:

When "R" in the above formula is represented by  $\text{CH}_2\text{CH}_2\text{CH}=\text{CH}-\text{CH}_3$ , we have the formula for penicillin F. For penicillin G, the side chain is  $\text{C}_6\text{H}_5\text{CH}_2$ ; for penicillin X, R is replaced by  $\text{HOC}_6\text{H}_4\text{CH}_2$ . Penicillin K has the side chain  $\text{CH}_3(\text{CH}_2)_6$ .

The potency of each of these forms of penicillin upon various disease germs has not yet been determined definitely, but work is continuing along these lines. One of the difficulties in the use of penicillin is the rapidity with which the drug is excreted from the body. Penicillin K is also rapidly destroyed in the body. Physicians are looking eagerly for the time when they will be able to prescribe specific forms of penicillin for any given disease.

The administration of penicillin has received considerable attention. One of the most effective methods approved for delaying the absorption and excretion of penicillin is by intramuscular or sub-

cutaneous injection of the compound suspended in sterile peanut oil and beeswax. The slow absorption of penicillin may be accomplished by administering the drug in an oil-water emulsion using as a vehicle a lanolin-like substance known commercially as "solvecillin."

The most spectacular development during the year in the chemistry of penicillin was the announcement in November, 1946, of the successful synthesis of penicillin G. This announcement was made by Dr. Vincent duVigneaud and his associates at the Cornell University Medical College, New York City, who were reporting the results of the study of a large group of investigators from many institutions, both in this country and in England. Dr. duVigneaud and his co-workers have succeeded in preparing and isolating a small quantity of material which they proved to be penicillin G. The mechanism of the reaction is still obscure, but the product was proven to be analogous to the penicillin produced by broth culture, both by its decomposition products and its clinical activity. The use of radioactive sulfur as a tracer element has also been employed for the confirmatory identification of the product. The immediate result of this outstanding contribution will probably not mean a cheaper production of penicillin or a product of greater uniformity although these results may follow at a later time. The first result undoubtedly will be the preparation of other forms of penicillin which it is hoped may have the ability to control certain forms of infection that are now thought to be immune to penicillin treatment. Perhaps a penicillin will be made which behaves more effectively in the human body than the penicillin which we now know.

Streptomycin has also received close attention during 1946 (see 1946 YEAR BOOK, p. 105). It was discovered in 1944 and has advanced to large scale commercial production with amazing rapidity. It is not a rival of penicillin but is a supplement to it in the fight against disease. Penicillin is primarily effective against gram-positive bacteria, while streptomycin is useful in the control of infections of gram-negative bacteria.

The manufacture of streptomycin is by a fermentation process which is very similar to that used in the production of penicillin. A nutrient medium is inoculated with *Streptomyces griseus*. The final product after fermentation contains 0.005% of streptomycin which is removed by filtration, absorption in carbon, washing, evaporation, precipitation, and drying. The product is then very carefully purified for the removal of any toxic compounds which may be present. The final handling consists of high vacuum sublimation, weighing into vials and packaging. The entire process is conducted under the most strict sterile conditions. The main production of streptomycin comes from Merck's \$3,500,000 plant at Elkton, Va. and Rahway, N.J., which is just being completed. Production in this plant began in May, 1946. In September, more than 100,000 grams per month were being produced and by November, it was expected the production would be twice this amount.

A study of the structure of streptomycin is now actively progressing. Some of the decomposition products of streptomycin have been identified but complete knowledge of the structure has not yet been worked out. The condensed formula for streptomycin is given as  $C_{41}H_{78}N_7O_{14}$ . During September certain hospitals were designated as distributing points for the use of streptomycin, but later in the year all hospitals were allowed to buy the drug directly, and some streptomycin was available for

scientific research, both in this country and abroad. The administration of streptomycin is similar to that for penicillin. Streptomycin, suspended in peanut oil and beeswax, is not absorbed so readily as is penicillin. The drug has been found useful in the treatment of many diseases such as peritonitis, liver abscesses, bile duct infection, wounds, tuberculosis, certain types of inflammation of the heart valves, and pneumonia. Particular interest attaches to its use in connection with the treatment of tuberculosis. It is not a cure for this malady, but it gives considerable protection against it, and has helped more than any remedy previously tried. The disease returns when the streptomycin treatment is withdrawn. It is hoped that further study will reveal a remedy related to streptomycin which may be useful in checking the ravages of tuberculosis. Studies at the Squibb Institute, New Brunswick, N.J. have shown that streptomycin is not as efficient as penicillin in the treatment of syphilis. These studies have led to the conclusion that penicillin G is more than 3,000 times as effective as streptomycin in the treatment of syphilis.

Leprosy, caused by a germ which is similar to the one which produces tuberculosis, has long been considered incurable, but it seems to be yielding to some of the modern drugs. Chalmogra oil has been given up but streptomycin looks promising and three of the sulfa drugs (promin, diasone, promizole) have been successful in actually curing cases of leprosy. In the leper colony at Carville, La. 37 patients were discharged as cured in 1945 and there will be about 40 cures in 1946. Recovery is slow and daily treatments are needed but "even the most hopeless cases" may be suppressed in five years or less.

Metopryl is the trade name given to the new anesthetic which is n-propyl-methyl ether. It is reported that it gives great muscular relaxation and longer effect together with less irritation and less disagreeable after-effects than the anesthetics in common use.

High blood pressure is effectively reduced by a new drug being developed by Frederick Sterns and Company of Detroit, Michigan. The compound is designated as O-4, 277. Chemically it is 1-(p-hydroxyphenyl)-1-2-isopropylamino-ethanol. It may be administered orally, intravenously, or intramuscularly. The drug is more effective in lowering high blood pressure than the nitrites which are commonly used, and the effect lasts from one to four hours. It is believed that the result is produced by the stimulation of the vaso-depressor mechanism. If this explanation is confirmed, the later use of this new compound will be successful in furnishing relief for many ailments which are caused by high blood pressure.

Ergosterol has been isolated and identified in the sterol fraction from a strain of *penicillium notatum* grown by submerged culture. Identification was made by a study of the physical properties of the ergosterol as well as those of the benzoate. This work was done by Kenneth Savard and Galdon A. Grant at the laboratories of Ayerst, McKenna, and Harrison, Ltd., St. Laurent, near Montreal, Canada.

Desoxycorticosterone acetate is a remedy which is being investigated at the Long Island College of Medicine to check the intoxication which is known commonly as "radiation sickness." This intoxication is produced by x-ray and radium radiation and has limited the success in the treatment of cancer especially when a large portion of the body is exposed to the radiation. This radiation sickness is believed to be due to substances which resemble histamine or to histamine itself. Desoxycorticosterone counter-

acts the effects of histamine and experiments have shown that it produces a striking reduction in the fat content of the liver. There was no striking difference in the radiation effect on the bone marrow and spleen. The effect upon the liver is expected to increase the efficiency of radioactive substances in the treatment of leukemia and cancer.

Aralen is the commercial name given to a new anti-malarial drug which is one of the results of the extensive anti-malarial campaign conducted during the war. The production of the anti-malarial SN7618 is described in the 1946 YEAR BOOK on page 108. Associated with it is aralen, which chemically is described as 7-chloro-4(4-diethyl-amino-1-methylbutylamino) quinoline diphosphate. This compound was synthesized in 1944 and has been tested clinically under the direction of the National Research Council. It is claimed to be a cure for certain types of malaria and to be able to suppress the common type, known as vivax, which recurs under normal conditions. Aralen may replace atabrine and quinine. It requires only two tablets a week, whereas atabrine requires 1 tablet per day. Aralen does not discolor the skin. Quantities of the new drug are being sent to the malarial areas for field tests.

**Insecticides.** Insecticides have advanced extensively during recent years. The United States Tariff Commission shows that the production of synthetic organic insecticides in 1945 amounted to 42,963,000 pounds, valued at \$21,903,000.00. Of this amount, more than 75% is the chemical known commercially as DDT, chemically as 4,4'-dichloro-diphenyl-1,1,1-trichloro-ethane. This insecticide (see 1946 YEAR BOOK, page 106) is now available in desired quantities, and its use has extended widely. Much of the recent development in its use has been in the direction of methods of application and studies in its selective action. It is not effective against all forms of insect life. For example, DDT is said to be powerless against the cotton boll weevil, and it is not as effective against flies as pyrethrum. It is likely that the general insecticide of the future will consist of a mixture of materials. DDT has been found to be effective for the destruction of the codling moth in some fruit-growing areas. An emulsion of DDT prepared by the Pennsylvania Salt Manufacturing Company is recommended for use on the walls of hospitals, hotels, laundries, and other service buildings. When the solvent evaporates, the residual DDT crystals are effective in killing most insects which are found in these places. The Sherwin Williams Co. of Cleveland, Ohio, has prepared a suspension of DDT crystals in a synthetic resin. When this suspension is brushed upon screens, porch ceilings, floors, and light fixtures, the material dries quickly, leaving an almost invisible film which is deadly to flies, mosquitos, fleas, ants, and other insects which are affected by DDT. As the surface insecticide is worn away, it is claimed that crystals migrate to the surface prolonging the toxicity, and as a result lasts three months when exposed indoors, and a month for outdoor exposure. Attention has been called again to the danger accompanying the indiscriminate use of DDT. Work done in the Veterinary Laboratory, Ministry of Agriculture, in England, shows that when a 5% solution of DDT in acetone is rubbed on the ears, head, and feet of rabbits, severe poison is produced which is generally fatal. So weak a solution as 0.5% will cause poisoning of young rabbits. These observations emphasize the danger of applying preparations of DDT for the treatment of mange in small animals.

Hexaethyl tetraphosphate is a new insecticide which is being produced by the Monsanto Chemical Company of St. Louis, Mo. The formula is one which has been in use in Germany. It was brought to this country by the American scientific teams. The new insecticide is particularly effective against aphids and mites, both of which are not destroyed by DDT. The new remedy will supplement nicotine sulphate, the supply of which is inadequate for present needs. It is expected that this new material will be used in conjunction with DDT.

Research on an intensive and extensive scale is being conducted on the insecticidal properties of many other compounds such as benzene hexachloride, hexaethyl tetraphosphate, azobenzene (an analog of DDT), TGE (the fluorine analog of DDT), hydroxypentamethylflavan, and ethylene dibromide.

A fungicidal dusting compound has been prepared by the Du Pont Company. It is effective in preventing black spot, powder mildew, and rust on the leaves of roses. The insecticide kyrocide is a dust powder from the natural cryolite ore which is obtained from Greenland. It has been used successfully and extensively in combating the ravages of velvet bean caterpillar which threatened to destroy nearly a million acres of the peanut crop in Alabama, Georgia, and Florida.

**Weed Killers.** Weedone is the commercial name applied to the weed killer known chemically as 2,4-D (2,4-dichloro-phenoxyacetic acid). This material is recommended for the killing of poison ivy, bindweed (wild morning glory), and other broad leaf plants. It is much less harmful to grass and similar plants, such as wheat.

**Ship Paint.** The development of a successful barnacle-proof paint is claimed by the Battelle Institute, Columbus, Ohio. The paint contains metallic copper which renders the painted surface poisonous to barnacles and similar forms of marine life. It has been tested in various localities and has been given service tests in various sections of the Atlantic Ocean, the Pacific Ocean, and the Caribbean Sea.

The new ship paint has prevented barnacle infestation for as long as two years. This is said to be about four times the service life of ship hull paints meeting ordinary specifications.

**Lignin.** Lignin, which has been called the greatest waste in industry, is available in very large amounts under present manufacturing conditions. It makes up from 20% to 30% of the weight of wood. It must be removed in the production of cellulose for the manufacture of fabrics, paper, nitrocellulose, and other products. The removal and disposal of lignin is an expensive process. A recent use for at least part of this material has come from the rubber industry. When lignin is linked with either synthetic or natural rubber in latex form, and then coprecipitated or coagulated, there is formed a material which has increased strength and toughness. This rubber is lighter than that which is prepared with the usual carbon black. It is possible also to produce bright colored articles by mixing pigments with the lignin. The tensile strength of lignin-reinforced rubber compares favorably with rubbers prepared by the best known methods. Other proposed uses for lignin include the manufacture of phenols, cresols, liquid motor fuel, wood sugar, alcohol, and many other products. It is estimated that all the methods now proposed for the utilization of lignin would not consume more than 38% of the enormous amount of lignin which is available.

B. SMITH HOPKINS.

**CHESS.** The death of Dr. Alexander A. Alekhine, long the world champion, left that title vacant and 1946 drew to a close without a successor having been selected.

Considered among outstanding candidates for the crown are Dr. Max Euwe of Amsterdam and Mikhail Botvinnik, Russian champion, both of whom turned in major triumphs during the year. Dr. Euwe, world champion from 1935 to 1937, triumphed in Section B of the international masters' play at London and was second to Botvinnik at Groningen in the Netherlands. Botvinnik added to his laurels when he led a Russian team to a 12½-7½ victory over a group of United States stars at Moscow.

Mendel Najdorf of Poland, the only contestant to gain a decision over Botvinnik at Groningen, also proved a leader among masters, winning tournaments in Argentina and Prague.

The open championship of the United States Chess Federation was captured by Herman Steiner of Los Angeles, who also triumphed in Section A of the masters' tourney at London. Samuel Reshevsky of Boston won the national laurels for the fifth time and annexed the Frank J. Marshall Trophy, which had been held by Arnold S. Denker of Forest Hills, Long Island, since 1944. Reshevsky regained the honors in New York last fall after Denker had successfully defended the title in a Spring tourney at Los Angeles. The women's national crown was won by Miss N. Mary Karff of Boston.

THOMAS V. HANEY.

**CHILDREN'S FUND OF MICHIGAN.** A Fund established by James Couzens with a gift of \$10,000,000 in 1929 to promote the health, welfare, happiness, and development of children in Michigan, primarily, and elsewhere in the world. During the fiscal year ending Apr. 30, 1946, a total of \$759,870.26 was expended. Total assets on that date were \$5,996,243.14. Chief officer: Wm. J. Norton, 660 Frederick Street, Detroit 2, Michigan.

**CHILE.** A republic of South America. Area: 286,396 square miles. Population: 5,237,432 (1943) Capital: Santiago.

Chile varies from 45 to 250 miles in width and its length of 2,660 miles is more than ten times as much as its greatest width. The Andes, a central valley, and coastal ranges divide the country longitudinally, while it is separated latitudinally into the northern mining region, the central agricultural area, and the southern forest and grazing lands. The climate is extremely arid in the north, temperate in the central part, damp and cold in the south.

**The People.** The Chileans are predominantly of European descent, with some Indian strains. About 15 percent are mestizos and about 5 percent Indians. The largest foreign element is Spanish, but there are sizable numbers of Germans in the south-central area. Population density per square mile varies from 0.5 in the Province of Aysen to 256.3 in the Province of Valparaiso. More than 80 percent of the people live in the central valley. The largest cities are: Santiago, 984,500; Valparaiso, 263,200; and Concepción, 86,000.

Spanish is the official language, but German is spoken and taught in some communities of the country. The predominant religion is Roman Catholic.

According to official estimates, 76 percent of the adult population in Chile is literate. In 1945, 452,826 students were enrolled in primary schools and

55,000 in secondary schools. During 1942 a total of 6,402 students were enrolled in the country's five universities.

Chile has advanced social legislation which provides pensions for sickness, maternity, and old age, as well as for invalids and survivors. The cost is borne by employers, employees, and the State. The Chilean Social Security Fund, established in 1924, handles the funds, and has accumulated capital of more than 54,000,000 pesos. This is a state corporation, which invests in social welfare projects, workers' houses, model farms, apartment houses, etc.

**Government.** Under the Constitution of 1925, Chile is a centralized republic of 25 provinces. The constitution provides for a bicameral Congress: a Senate of 45 members and a Chamber of Deputies of 147 members. Members of both houses are elected by proportional representation. Congress convenes on May 21 of each year and adjourns on September 18. The President is elected for a 6-year term, and is assisted by a Cabinet of 12 members, of whom one is without portfolio. President Juan Antonio Ríos Morales was elected on February 2, 1942, in a special election made necessary by the death in office of President Pedro Aguirre Cerda, and was inaugurated on April 1 of that year.

**Events, 1946.** A Presidential election and unusual labor difficulties marked 1946 as a crucial year for Chile. President Juan Antonio Ríos, whose recurrent ill-health forced him to withdraw from the Government in November, 1945, was replaced by Radical Party leader Alfredo Duhalde on January 17.

Acting President Duhalde touched off a serious crisis on January 28 when he issued a decree outlawing the Mapocho and Humberstone nitrate unions in Tarapacá Province for carrying out an illegal strike. The Chilean Confederation of Labor (CTCH), bulwark of the Socialists and Communists, called an immediate protest meeting in Santiago which ended in a skirmish between unionists and police, killing six and wounding at least seventy. As a cabinet crisis was precipitated, and the 300,000 members of the CTCH went on strike the next day, President Duhalde placed the country under a state of siege and ordered the arrest of sixteen CTCH leaders, including Bernardo Ibañez, Secretary General of the Federation.

On January 30 the unions called off the strike after the President lifted the state of siege and released the arrested labor leaders in partial compliance with the CTCH's manifesto, which also demanded the formation of a leftist Cabinet and a break in relations with Spain and Argentina. The Cabinet was partially reorganized on February 1 to include several Socialists and non-partisan military men. The Communist faction of the CTCH, dissatisfied with the reshuffled Cabinet and awaiting Government recognition of the nitrate unions and unionization of farm workers, called another general strike. The Socialist wing of the CTCH, which long had struggled for CTCH leadership, joined the Government and withdrew support of the strike, which it termed a political maneuver. The Communists, however, carried out their promise of a strike, which was most successful in the nitrate plants, ports, copper mines, and coal mines. Complete polarization of the two CTCH groups was accomplished when the Government recognized the Socialists as the "legitimate representative organ of the working classes," while the Communists refused to recognize the incumbency of Secretary Ibañez. At the end of February it was estimated

that fifteen percent of Chile's workers were on strike.

The Communist party, the best organized in Latin America, constituted a powerful force in the presidential elections scheduled for September. In addition to its control of unions in essential industries, the party was represented in the Chilean Congress by fifteen Representatives and five Senators. Their supremacy in leftist politics was seriously combatted by the end of spring by the Socialists, who held the advantage of having four Ministers in the Government. In union activities, however, the Communists gradually succeeded in achieving overwhelming control. In the May elections for local trade-union boards the Socialists practically disappeared from power. Communist control of unions in coal fields, nitrate plants, and copper mines was supreme. By July the 60-40 ratio between Communists and Socialists that existed in the CTCH at the beginning of the year had changed to about 80-20.

With the death of President Rios on June 27 the groupings in the political campaigns for the Presidential elections became more distinct. Roughly, the struggle was between the right and the left. In 1942 Rios had been elected by a powerful coalition of the left, known as the Popular Front and consisting of the Radical, Socialist, Communist, and Democratic parties and a faction of the Liberal party. Since the Rios victory, however, the Popular Front slowly crumbled as interparty quarrels replaced concerted action. By the summer, the left consisted of the Radicals, Socialists, Communists, and Social Catholics as opposed to the rightist parties which included the Conservatives, Liberals, and Labor-Agrarians.

At the end of July the Presidential campaigns resolved into a four-man race. The hope of the rightists that the defection in the Popular Front would splinter the leftist coalition into a number of minor parties, each with its own candidate, was blasted when Gabriel González Videla of the Radical Party received the united backing of the Radicals, Communists and a good portion of the Socialists. During the formation of this Videla coalition, Acting President Duhalde, whom dissident Radicals supported in the hope of effecting a combination with Ibañez Socialists, was expelled from the Radical party "for doctrinary, political and administrative reasons."

The rightists failed to achieve any coalition. After a joint convention of Conservatives, Liberals, and Agrarians, ended on July 14, with no progress toward a reconciliation of differences each party selected a candidate. The Conservatives picked Senator Eduardo Cruz Coke, the Liberals decided on veteran politician and Senate President Arturo Alessandri and the Agrarians chose Jaime Larraín. Within a few days the conservative Agrarians dropped Larraín and adopted Alfredo Duhalde, who resigned as Acting President to accept the nomination. Duhalde also gained the support of the Socialists who had rejected Videla.

Within a week of the September 4 election, the line-up of the rightists candidates abruptly changed. Coke retained the support of the Conservatives but Alessandri and Duhalde withdrew in favor of Alessandri's son, Fernando, who received the support of the Liberals and some Radicals. The dissident Socialists broke away from any combination and ran Bernardo Ibañez, their party Secretary and Secretary General of the CTCH.

The election results gave Videla a clear-cut victory. The final tabulation showed: 191,351 for Videla; 141,134 for Coke; and 129,092 for Ales-

sandri. Despite this victory, Chilean law prohibited the inauguration of Videla because he had not received as many votes as all his opponents. According to the law, Congress would have to meet within fifty days of the election and select one of the two leading candidates as President. In a meeting of the joint session of Congress on October 24, Videla was confirmed as President by a vote of 138 to 46.

In fulfilling his preelection pledges to the Communist party, the President-elect gave three of the eleven Cabinet posts to Communists on October 31. This established a new mark in hemispheric political life; for the first time Communists were assigned to participate officially in the Government of a Latin American country. In many quarters, the appointment of Communists to important ministerial duties was interpreted as an indication that Videla intended to carry out a Communist-supported plan to organize agricultural labor unions and reduce absentee landlordism. Both Liberals and Conservatives had previously opposed the plan strenuously. The Ministries allotted to Communists were: Communications and Public Works, Carlos Contreras Labarco, leader of the Communists; Agriculture, Miguel Concha; Lands and Colonization, Victor Contreras.

Other appointments to the Cabinet were: Interior, Luis Alberto Cueva, Radical; Foreign Relations, Paul Juliet, Radical; Education, Alejandro Rios Valdivia, Radical; Labor, Luis Bossay, Radical; Economy and Finance, Roberto Wachholtz, "Technician"; Defense—Manuel Bulnes, Liberal; Justice, Guillermo Fuenzalida, Liberal; Public Health, Fernando Salas.

President-elect Videla began his term in office at a time when Chilean economy was caught in a web of inflation and lagging production. The cost of living index rose from 176.4 in 1937 to 445.9 in February, 1946. Since more than half the cultivated land was owned by some 600 landlords, most of the agricultural workers were tenant farmers. In this economy the average worker, who earned about a \$1.00 a day, found difficulty in purchasing eggs at \$.60 a dozen, or an ordinary shirt at \$6.00.

On the eve of his November 3 inauguration, President Videla outlined his national program with the introduction that no one party would dominate his Government. The course of his "National Government" would be guided by four points: (1) the battle against inflation, "the most serious difficulty facing Chile today"; (2) the widening of Chile's industrialization, "with the idea of exporting manufactured items"; (3) the raising of the economic and cultural level of the people, "for the sake of eliminating class division and rates"; (4) the development of education under a less costly system.

After inviting foreign capital to invest in Chilean resources, President Videla explained that the growth of communism in Chile had been caused by a sharp division between the three classes—the rich, the middle class, and the poor. He pointed out that extreme inflation had driven towards the left not only the poor but large segments of the middle class as well. The Communist party in Chile was organized "democratically as a legal and constitutional party," he said.

Condemning an armaments race as incompatible with the principles laid down at the San Francisco meeting of the United Nations, President Videla said, "I don't much like any idea that means an increase in our spending on armaments, which for Chile would mean a heavy load. Almost one-

quarter of our budget now goes for national defense. The armaments race has been one of the bad factors in Latin America. I think the Government should impede an armaments increase. We're too poor to bear the load and need the money to raise the public standard of living."

In his first official address as President, Videla on November 16 called upon his country to wholeheartedly cooperate with the Government and make sacrifices if necessary, in curbing the wild inflation. On the day of the Presidential appeal, inflation had reached its highest level, with the peso worth only 10 percent of its 1939 purchasing power. Earlier in the month, Finance Minister Wachholtz attempted to put a brake to the inflation by suddenly prohibiting all banking advances. The restriction of credits caused a minor panic on the Valparaiso stock exchange, but the crisis passed. The more moderate members of the Cabinet successfully prevailed on Wachholtz to loosen his order and the result was a credit restriction, not so severe as originally intended, but aimed to reduce speculative credit and force goods on the open market.

Another anti-inflation measure was the establishment for 1947 of a minimum national wage, fixed at 25 percent over the 1946 level. The Communist members of the Cabinet almost achieved realization of their long-standing demand for unionization of farm workers, but the liberals obtained a compromise with President Videla, who agreed that the regulation should be fixed by Congress. With the Congress controlled by liberals and conservatives, passage of the bill was unlikely.

**International Relations.** Diplomatic relations with the Soviet Union, for the first time in Chile's history, were established in April with the arrival of Soviet Ambassador Dmitri A. Zhukov in Santiago. An exchange of diplomatic representatives was also arranged with Australia and Yugoslavia.

The provisional commercial agreement made between the United States and Chile in 1945 was extended for an additional year on July 31. Under the terms of the agreement, Chile granted United States commerce, without compensation, reductions in import duties on many United States products, ranging from cotton cloth to rolled iron and steel. The United States Department of State explained that the unilateral duty concessions were made "in the interest of expansion and liberalization of trade."

During November, Dr. Felix Nieto del Rio, Chilean representative to the United Nations, announced that he had received instructions from Foreign Minister Juliet actively to support the Polish resolution recommending a severance of relations with the Franco Government of Spain.

The economies of Chile and Argentina were dovetailed on December 13 in a far-reaching treaty providing for an exclusive customs union and excluding even those countries involved in a most-favored-nation agreement with either Chile or Argentina. The agreement provided for the establishment of a free port at Valparaiso, giving Argentina access to the Pacific Ocean; the reduction of all tariff barriers between the two nations; the loan of about \$150,000,000 for industrialization purposes and the improvement of railroad facilities between Argentina and Valparaiso, and the assurances of a food supply to Chile. Argentina was granted supplies of coal and copper nitrate to aid her industrialization program.

President Videla lauded this pact, saying that it fitted into Chile's policy of supporting the United Nations and Pan American solidarity. Insisting that

the agreements were devoid of any political significance, the President said that Chile's foreign policy would be changed in no way. He explained the treaty as an "economic agreement designed to permit Chile to obtain economic independence, without which all democratic formulas are merely statements unsupported by the indispensable conditions of economic development."

**Economic Development.** A five-year construction plan, designed to bolster Chile's economic structure was approved on September 21 by the Government. The plan calls for the following expenditures: irrigation and soil rehabilitation, \$4,268,000; roads and bridges, \$4,240,000; railroads, repairs and new lines, \$2,450,000; portable water and sewage systems, \$2,134,000; harbor works and repairs, \$2,134,000; architectural works and sports development, \$2,488,000; appropriations for the University of Chile, \$240,000. To offset the dangers of placing too much reliance on nitrate and copper exports, which constituted 80 percent of total exports, the Government attempted to purchase farm and industrial equipment in the United States for the development of other industries. In working for a better balance of exports to finance its petroleum and steel industries, Chile also attempted to obtain a loan from the U.S. Export-Import Bank.

In addition, another loan of \$20,000,000 was being sought from the Export-Import Bank, to be utilized as follows: agricultural machinery, \$3,200,000; copper industry, \$600,000; fishing, \$500,000; oil industry, \$5,000,000; central hydroelectric plant, \$5,500,000; lumber, for the development of a pulp and paper industry, \$3,400,000; general transport, \$3,600,000; cement, \$500,000. This made a balance over the requested loan of \$2,300,000, which would be supplied by contractors.

On October 18 the Export-Import Bank granted Chile credits of \$10,350,000, making a total of \$80,000,000 loaned since 1939. Of this sum, \$5,000,000 was extended to the Chilean State Railways and the remainder to the Fomento Corporation, a Government agency charged with starting and assisting private enterprise in industrial development.

**National Economy.** Chile's economic structure rests upon its copper and nitrate deposits. These two products usually compose 70 percent of the total value of exports. In 1944 Chile produced 490,441 tons of copper bars, over 1,100 tons more than were produced in 1943. Nitrate sales in 1943-44 totaled 1,050,555 tons, a decrease of some 190,000 tons from 1942-43 exports. In production of iodine, a by-product of nitrate, Chile leads the world, producing 69 percent. Chile is the leading coal producing country in Latin America, and has important deposits of iron ore, which yield normally about 1,500,000 metric tons annually. Because of transportation difficulties, production in 1944 fell to some 17,670 metric tons. Gold and silver are also mined in some quantity.

Chile's most important agricultural crops are: wheat, rice, oats, and barley. Raised in quantity also are corn, beans, peas, lentils, and fruit. Meat, wool, and wines are major products. Leading crop production for the year 1946 was: (in metric quintals) wheat, 9,510,450; oats, 849,986; barley, 778,757. In 1944 wine production totaled 314,000,000 liters. In 1945 rice production was 1,013,299 metric quintals.

Lack of coking coal, together with such factors as the small domestic market and high cost of credit, have held back industrialization of Chile. What manufacturing there is produces chiefly consumers goods for the home market.

**Foreign Trade.** Mineral products, principally copper and nitrates, compose Chile's chief exports. Exports of nitrate and iodine in 1944 totaled 976,808 metric tons. But animal products (wool, hides, meat), hemp, fibers, vegetables, nuts, and wines are also exported. In 1944 Chilean foreign trade, including specie, was valued at 1,642,740,000 six-pence gold pesos, of which exports accounted for 944,024,000 and imports for 698,716,000. Mining products exported amounted to 686,423,000 six-pence gold pesos; agricultural products, 61,333,000; animal products, 47,592,000; and food products, 20,974,000. In 1943 the five leading non-mineral commodities exported by Chile were: wool, hemp fibers, rice, sheep hides, and gold bars.

Before 1940 the bulk of Chilean exports went to the United Kingdom and Europe; since then the Western Hemisphere has become Chile's chief market. In 1944, 46.4 percent of Chilean imports came from Latin American countries, chiefly Argentina, Peru and Brazil; these countries took 20 percent of Chile's exports. The United States provided 43 percent of Chilean imports and purchased over two-thirds of its exports, exclusive of sales "to order."

JOSEPH P. BLANK.

**CHINA.** A republic in eastern Asia. Capital: Nanking (after V-J Day, Sept. 2, 1945, the Government started to move back the various ministries to Nanking from Chungking, the provisional capital).

**Area.** Including Formosa but excluding Outer Mongolia, the total area of the Republic of China and its dependencies amounted to 3,975,000 square miles (estimated) of which China proper accounted for 3,263,000 (including Formosa and Kwangchowan).

**Population.** The estimated population of China, including Formosa and Kwangchowan but excluding Outer Mongolia, was 445,250,000 (based on 1940 figures). Chief cities (with estimated prewar population figures): Shanghai 3,490,000, Peiping 1,556,000, Tientsin 1,292,000, Nanking 1,020,000, Tsingtao 515,000, Canton 861,000, Hankow (including Wuchang and Hanyang) 778,000, Chungking 635,000, Wenchow 631,000, Changsha 607,000, Hankchow 607,000, Weihaiwei 390,000, Foochow 323,000, Soochow 260,000, Amoy 234,000, Ningpo 219,000, Wanhhsien 202,000.

**Education.** According to available figures for 1945 there were 258,283 primary schools and 17,721,103 pupils, 3,455 secondary and vocational schools and 1,101,807 pupils, and 145 institutions of higher education with a total of 78,909 students.

**Religion.** With the exception of Christians and Mohammedans, most Chinese practise and profess all three indigenous or adopted religions—Confucianism, Buddhism, and Taoism. The Mohammedans are estimated at over 48,000,000. In 1934 there were 2,623,560 native Roman Catholics and 123 Catholic missions, with a staff of 16,241. The Protestant churches, with 1,130 mission stations and 488,539 communicants in 1932, had 19 colleges, 267 middle schools, and 37,714 students in 1934. The number of Christian missionaries in China declined from nearly 6,000 in 1937 to about 3,600 on June 30, 1941.

**Government.** The Organic Law of Oct. 4, 1928, revised Dec. 29, 1931, and Dec. 27, 1932, vested the supreme governing powers of the National Government of the Republic of China (inaugurated Oct. 10, 1928) in the National Congress of the Kuomintang (Nationalist Party), acting through

the medium of the Central Executive Committee. On Sept. 10, 1943, the Organic Law was revised to provide for the selection and appointment of the President of the National Government and of State Councillors (from 24 to 36) by the Central Executive Committee. The head of the Government is chairman of the State Council. Included under the National Government are five yuan (branches or councils)—Executive, Legislative, Judicial, Examination, and Control. President of the National Government of China and Commander in Chief: Gen. Chiang Kai-shek (elected Sept. 13, 1943; assumed office, Oct. 10, 1943, for a three-year term).

Following the outbreak of war with Japan in 1937 a Supreme National Defense Council (headed by Chiang Kai-shek) assumed direction of all political and military affairs. It included the heads of all party, political, and military organs together with other members who were nominated by the chairman and approved by the Council.

The Cabinet ministers at the beginning of 1946 were: President of the Executive Yuan—T. V. Soong (Sung Tze-wen); Interior—Chang Li-sheng; Foreign Affairs—T. V. Soong (Sung Tze-wen); Military Affairs—Chen Cheng; Finance—O. K. Yui (Yu Hung-chun); Economic Affairs—Wong Wen-hao; Education—Dr. Chu Chia-hua; Communications—Tseng Yang-fu; Agriculture and Forestry—Adm. Shen Hung-lich; Social Affairs—Ku Cheng-kang; Food—Hsu Kan; Justice—Dr. Hsieh Kwan-sheng (Sie Kuan-sheng); Overseas China Affairs—Liang Han-chao; Organization—Chen Li-fu; Information—Wang Shih-chieh.

**Events, 1946.** After eight years of war China, with the other nations of the world, presumably entered an era of peace and reconstruction. Japan had been defeated, the war lords had quit their factional strife and the struggle between the forces of the Kuomintang and the Communists had subsided to await the outcome of United States-sponsored mediation. Late in 1945 General George C. Marshall, former United States Army Chief of Staff, had been appointed United States representative in China. General Marshall was confronted with the complicated task of settling a compromise with the two factions. Without an end to the enervating civil war, China's much-needed agrarian reforms and latent industrial strength would take secondary importance as postwar problems.

The year opened with the Central Government of Generalissimo Chiang Kai-shek accepting the Communist proposal for a suspension of hostilities and arbitration of military differences, and offering the suggestion that General Marshall act as arbiter between the Government and the Communists "in all matters pertaining to the cessation of hostilities and the restoration of railway communications" in China. The reference to the opening of railways appeared to make the Communists dubious, for it possibly pertained to the transportation of Government troops into Communist areas to "repatriate Japanese," and would thus endanger the Communist military positions in those areas. Furthermore, the Communists hesitated to place themselves in a position where they might possibly have to reject the proposals of the United States representative. They tended to view United States mediation against the background of long-continued aid to the Government during the war and the transportation of Government troops on United States ships to Manchuria.

On January 5, three days after the Government forces had launched an attack into the province of Jehol on the southwest border of Manchuria, both

sides agreed to meet with General Marshall for formal conferences on ways to halt the civil war and reopen communications. The Government was represented by General Chang Chun, Governor of Szechwan Province, and the Communists by General Chou En-lai, leader of the Communist delegation in Chungking.

Simultaneous with the announcement on January 10 that the three generals had reached an agreement which brought a cease-fire order to the civil war fronts, Chiang Kai-shek opened the first session of a Political Consultation Conference at Chungking by proclaiming a far-reaching series of democratic and political reforms in China. In addition to halting hostilities the truce provided for the restoration of war-blocked communications and the establishment of a control organization, with American participation, to carry out the armistice agreements. Government troop movements in Manchuria and south of the Yangtze River were not effected by the truce, the nature of which constituted a compromise for both sides; by agreeing to Government troop movements in Manchuria, the Communists recognized to an extent the sovereignty of Chungking in that area, while Chiang Kai-shek modified his demands for Government penetration into the Chahar and Jehol provinces, thereby giving tacit consent to Communist control.

In his address to the Political Consultation Conference, consisting of thirty-eight representatives of nine parties and some non-partisans, Chiang Kai-shek presented the following Government steps for a new Chinese Bill of Rights: Measures to insure freedom of person, of conscience, of assembly and of publication; the end of the state secret police and new rulings under which only the proper judicial and police authorities would be permitted to make arrests, try, or punish individuals; equality of all legal parties before the law and their right to engage in activities within the law; release of all political prisoners except traitors who have committed injurious acts to the Republic and promotion of local self-government throughout the nation, with popular election to be held "according to the law" and from the "lowest strata upwards."

"What we have to consider here," Chiang said, "is a fundamental plan that will lead from war to peace, from resistance to reconstruction." He concluded his outline of democratic reforms by assuring the Conference that he would accept their decisions if they benefited national reconstruction and promoted popular welfare.

After three weeks of debate and discussion, during which the Communists agreed that Chiang would retain power as leader of China's new coalition government and the Democratic League delegation staged a one-day walkout because the police searched the home of one of their members, the Conference on January 3 unanimously approved a broad program to unify the nation militarily, politically, and socially. Within the frame of the adopted program, all factions represented at the Conference—the Kuomintang (Nationalists), Communists, the Democratic League, the Youth party, and minor parties—would contribute to the coalition all-China government, which, it was hoped, would bring peace to China for the first time since the Nationalist Revolution of 1926-27.

The program called for a three-man committee, advised by General Marshall, to work out the reorganization and merger of the Kuomintang and Communist armies with the object of reducing Government troops from 253 divisions to 90 and limiting the Communists to 20 divisions within six months. It forbade political parties to carry on

activities, open or secret, within the armed forces, prohibited soldiers from engaging in political activities while on active service and asserted that no party or individual may use the army as an instrument of political rivalry.

In the field of civic and economic reform the program introduced immediate freedom for all political groups and abolished wartime censorship of the press and other information mediums, like radio and motion pictures. The question of regional autonomy which involved the future status within the government framework of Communist China with its own laws, taxes, currencies, and political system was avoided. The program stated that "local self-government should be actively pushed and popular elections, beginning from the lower administrative units and gradually ascending to the highest unit, should be carried out, and provincial district municipal councils should be established throughout the country at an early date, the district magistrates to be elected by the people." In areas under dispute, the status quo was to be maintained until a decision could be made by the reorganized Nationalist Government. Economic reforms included state participation only in enterprises of a monopolistic character or those that cannot be undertaken by private business, the lowering of farm rents, the abolition of tenancy, and the publication of a budget.

A coalition government would provide an interim regime until a constitution was adopted and put into effect, after which the Government would be an expanded "State Council" of forty members, with the Kuomintang holding half the seats. Twenty seats would be divided among the Communists and other parties. Earlier in the discussions, the Communists' proposal for limiting the Kuomintang to one-third of the seats was not supported.

The optimistic hopes stimulated by the Conference results grew dim as new political and military strife widened the gap between the Kuomintang and the Communists. A fresh outbreak of civil war occurred in Manchuria in mid-February as Kuomintang forces occupied the rich area directly after Soviet withdrawal. Government troops, transported by the United States Navy with the approval of General Marshall, met Communist opposition when they landed on Manchurian soil and captured Liaochung. General Chou En-lai predicted a widespread revival of strife unless the Kuomintang consulted with the Communists and other parties in Manchuria regarding peaceful and coordinated plans for the re-establishment of the Chinese administration in the province. Stating that the Communists, with their headquarters in Yen-an, controlled 300,000 troops in Manchuria, Chou said that Government attempts to take over Manchuria by force would be met by force and suggested a three-man commission, composed of General Marshall, himself, and Kuomintang Gen. Chang Chih-chung to handle the Manchurian military problem.

The slow withdrawal of Soviet troops from Manchuria gave additional cause for Nationalist anxiety. According to the terms of the 1945 Sino-Soviet treaty, the Soviet Union recognized China's sovereignty in Manchuria and agreed to remove troops by February 1. Chiang felt that the continued presence of Soviet troops after that date jeopardized the possibilities of peace and threatened economic and political stability in that province.

The Manchurian question provided the true crux of controversy and struggle between the Nationalists and Communists in the foreground and the United States and the Soviet Union in the

background. Manchuria, almost twice as large as Texas, holds the richest farm lands and mineral deposits in the Far East. To the Chinese, the future of China seems inalterably linked to Manchuria, containing 70 percent of China's industrial capacity which would prime the entire industrial, economic, and monetary revitalization of the nation. To the Japanese, Manchuria was the heart of its Manchukuo Empire between 1932 and 1945 and constituted not only a major source of raw materials, coal and agricultural products, but a great source of finished iron and steel products. To the Soviet Union, presence in Manchuria was of high strategic and economic importance since it provided the Soviet Union with its only ice-free ports to the Pacific.

The measure of Manchuria's importance to the U.S.S.R. was reflected in the agreements of the secret Yalta Conference between the late President Roosevelt, Prime Minister Churchill and Generalissimo Stalin on February 11, 1945, in which the U.S.S.R. undertook on certain conditions to enter the war against Japan. The agreements, made public by the U.S. Department of State on February 11, 1946, included: (1) the status quo in outer Mongolia shall be preserved; (2) the former rights of Russia destroyed by the Japanese attack of 1904-05 to be restored, i.e. (a) the southern part of Sakhalin as well as all the islands adjacent to it shall be returned to the Soviet Union; (b) the commercial port of Dairen shall be internationalized, the pre-eminent interest of the Soviet Union in this port being safeguarded, and the lease of Port Arthur as a naval base of the U.S.S.R. restored; (c) the Chinese Eastern railroad and the South Manchurian railroad which provide an outlet to Dairen shall be jointly operated by the establishment of joint Soviet-Chinese Company, it being understood that the pre-eminent interests of the Soviet Union should be safeguarded and that China should retain full sovereignty in Manchuria; (3) the Kurile Islands shall be handed over to the Soviet Union.

The absence of any real conciliation over Manchuria brought a statement on February 17 from General Chou that unless the Nationalists confer with the Communists and other groups in Manchuria on peaceful and cooperative methods for the reestablishment of a Chinese administration in the northeastern provinces, resumption of civil war could be expected. According to the January 10 truce, both sides were to refrain from attacks and Nationalist troops were to be permitted to move into Manchuria. Early in February Communist headquarters asked for joint participation in the control of Manchuria on a coalition basis, similar to the plan for the reorganized Chinese Central Government based on a coalition of parties.

During the tender period of negotiations between the Nationalists and Communists on the Manchurian settlement, and the Nationalists and the U.S.S.R. on the evacuation of Soviet troops, persistent but unofficial reports in American newspapers claimed the U.S.S.R. was bargaining for additional concessions in Manchuria before withdrawing. Further reports indicated that the Chinese were taking a firm stand in the position that no economic adjustments would be made so long as Soviet troops remained in Manchuria.

A gradual change occurred in Chinese attitude toward Soviet inclusion in Manchurian activities. When the Sino-Soviet treaty of 1945 was made, the Chinese accepted the Yalta agreements and used them as a basis for the treaty. During the early months of 1946, public demonstrations and Chi-

nese newspaper editorials demanded speedy Soviet retirement from Manchuria. On February 23, seven high Chinese Government officials protested to the Foreign Office against the secret Yalta agreements because China was not a signatory to the decisions and therefore could not consider them binding. Within two days of the protest, Chiang restated China's sovereignty in Manchuria and declared that negotiations with the Soviet Union would be based on Chinese law, the August 14, 1945 treaty and the international treaties to which China was a signatory.

On February 26 the Moscow radio said that the "greatest part of Soviet troops had left Manchuria."

In March the Soviet Government, in reply to a Chinese note requesting immediate withdrawal of Soviet troops, delivered a note stating that the withdrawal of Soviet troops would be completed by the end of April. Foreign Minister Wang Shih-chieh, who made the announcement before the People's Political Council, reiterated China's reparation claims on all Japanese public and private properties in China, including the northeastern provinces (Manchuria) and Formosa. Simultaneously with the Soviet note, reports indicated that the Communists were consolidating their positions in the northern provinces of Manchuria and the Government forces were fanning out in a broad eastern movement from their base in Mukden.

The Manchurian problem was intensified and complicated by reports that the Soviet was removing industrial machinery as they evacuated. The Communists were loathe to relinquish their hold on the northern provinces until they were certain of their position in the projected new government, for the right wing of the Kuomintang condemned collaboration with the Communists. Because of mutual distrust no solution appeared to crystallize. The Communists claimed they had no objection to the Government establishing "sovereignty" in Manchuria by occupying the Peiping-Mukden railway and the main Changchun railway, but vigorously opposed Government maneuvers to obtain flanking terrain to these main routes.

Until the Communists saw concrete evidence of the type of political regime intended for Manchuria and the rest of China, it appeared unlikely that the plans for political and military unity would be realized. On February 25 the Communists entered a formal agreement on the military integration of their forces into the National Army. The agreement stipulated that within eighteen months China was to have a single, unified army of sixty divisions composed of fifty Government and ten Communist divisions, which would be combined into three-division armies commanded by both Nationalist and Communist generals. Divisions would be limited to 14,000 men. If the terms were carried out, China would reduce her combat ground forces from an estimated 3,000,000 to 840,000 men. At the time of the treaty, total forces in China, including administrative and service personnel and irregular units, numbered 6,000,000, with the Government forces accounting for 4,800,000.

The failure of the Political Consultation Conference, the advisory body that met in March, to achieve progress in Kuomintang-Communist relations resulted in new military clashes in north China. The Communists boycotted the opening of the Conference's Spring session, claiming no progress could be made because the majority strength of the anti-Communist right wing of the Kuomintang would undermine any Kuomintang-Communist cooperation. When the Communists finally

entered the discussions, disagreement arose over the apportionment of positions in the new Government and the problem of provincial autonomy. The Kuomintang stirred argument by advocating changes in the original PCC principles to place over-all authority in a popularly selected national assembly, which would elect the President and exercise the rights of initiative, election, referendum, and recall.

They desired the President, who would be Chiang Kai-shek, to have the widest prerogatives of powers, while the Communists and the Democratic League sought to curb presidential powers by a strong popularly-elected legislature that could dismiss a cabinet. The same disagreement on executive power was evident in the Communists' wish for extensive provincial autonomy against the Kuomintang efforts to have the provinces ruled from the center.

In the apportionment of government posts, the Communists sought sufficient representation on the State Council to have veto power over major disputes and hold at least two of the major ministries of the executive Yuan. The Communists and the Democratic League favored the original PCC constitution with its provision for a more or less orthodox parliamentary system and an Executive Yuan responsible to the popularly elected Legislative Yuan. The President would be popularly elected and would have limited powers. The rupture between the two leading parties was intensified by an attack on Chiang Kai-shek printed in the *Emancipation Daily News*, Communist organ of Yen-an, which charged the President with attempting to perpetuate a personal dictatorship by rejecting the original PCC agreements and refusing to recognize the Communist-promoted local governments in Manchuria.

As the most powerful opposition party in China, the Communists set themselves up as the leading party of progress and the champion of agrarian reform. They directed their appeal to the peasant masses, claiming that the object of the revolution was a new life for the masses of China and the new life began with economic betterment. Their program set forth the promise that only by exercise of political power could this economic betterment, involving literacy and technical training, be achieved. And this could not be achieved so long as the moneyed official classes and the vested interests of the landlord retain government power.

To the Communists the machine of revolution was a strong political organization, with every member submitting wholeheartedly to party discipline. As a self defense measure, the party must work often in secret and must maintain an army. The whole program was bound together by the needs of the peasants with whom party cadres must work and live.

As regards the Chinese Communists' conjectured link with the Soviet Union, John K. Fairbank, former chief of the U.S. State Department's information and cultural program in China, wrote that "The Chinese Communists are genuine communists and are proud of it. Their affinity with Soviet Russia is doctrinal and theoretical; it does not need to be practical or procedural. Concrete evidence of their maintaining close contact with the Soviet Union is surprisingly scarce; the Russians on their part maintained a surprisingly correct record of wartime aid to Chungking, not to Yen-an."

The practice followed by the Communist after achieving control of an area is to stimulate and propagate meetings between landlords and ten-

ants. Since the landlords are in the minority, they usually accede to their former tenants who are reimbursed with land, money, and chattel for past grievances. Many of the big landlords joined the Communist "voluntarily" and redistributed their land. In Manchuria the Communist won wide groups of peasants to their program by redistributing vast areas of rich farmland confiscated from Japanese settlers. Although large landholding estates were still possible under the Communists, since the buying and selling of land was prohibited, the practice was discouraged by low rents and interest rates.

With their efforts to reduce landlordism, the Communists have tried to persuade the moneyed population to invest in industrial and business enterprises. They reduced taxes on industrial plants and often offered subsidies to encourage a growth of production. Their program included government ownership of key industries and utilities, but welcomed foreign capital if "it were employed in full accord with the laws of China" and "to the mutual advantage of the investor and the country."

The Kuomintang Party, led by Chiang Kai-shek, was the original radical party during the 1926-1927 revolution. By a process of gradual metamorphosis occurring as the party entrenched itself, its composition split up into cliques ranging from extreme conservatism to leftism. In 1946 the party, containing about 3,000,000 members, had a central executive committee of 222 and a standing committee of 36 members.

The most powerful group within the party were the conservatives, led by the Kuomintang Minister of Organization Chen Li-fu, which dominates the common membership of the Kuomintang through a closely-knit organization that goes down through all strata of the party. Several army cliques compose the "Whampao Cadets," under the top leadership of Gen. Ho Ying-chin, former Chief of Staff, which stresses militarism and vigorous opposition to the Communists. A mildly liberal group, founded by Yang Yung-tai, former Governor of Hupeh, aims at promoting subordination of the military to scientific administration, industrialization and agricultural reforms. Farther to the left are minor groups headed by Dr. Sun Fo, head of the Legislative Yuan and son of Dr. Sun Yat-sen, and Shao Litze, Secretary-General of the People's Political Council, a 290-man body established in 1937 to advise the Supreme National Defense Council. Within the realm of the Kuomintang were special interest groups of bankers and industrialists, roughly equivalent to the American lobbyists, who worked to promote action to their own advantage.

The strength of United States economic influence and aid, supplied in relation to the Manchurian issue, the Kuomintang-Communist civil war and the general political and economic future of China caused considerable controversy both outside and within China. Though the United States disavowed interference in China's internal affairs, the policy, as defined by President Truman in December, 1945, was to help China effect a coalition government by having the Kuomintang yield a part of the exclusive control of the Central Government to other parties for a transition period until a permanent constitutional democracy could be instituted.

The United States House of Representatives on March 12 overwhelmingly approved a bill, intended to "help maintain peace in the Orient," which permitted President Truman to lease or donate 271 small naval vessels to the Chinese Central Government and to provide American technical advisors and naval services. The bill permitted the

President to send, in addition to a mission of 300 officers and men, floating docks and other material necessary for "augmenting and maintaining" the Chinese naval establishment.

At the same time General Marshall revealed that several of the Government divisions which were embarking for Manchuria on American vessels had been trained and, to a large extent, equipped by Americans. In all 39 Chinese divisions had been trained by Americans.

Shortly thereafter Lieut. Gen. Albert C. Wedemeyer, commander of U.S. Army forces in China, announced the disbandment of Army forces in China and the reversion of Marine forces to Navy authority. Thirty thousand marines were maintained in north China and, although no word was mentioned about their withdrawal from China, they were being demobilized rapidly.

General Chou, apparently alluding to the United States support of the Central Government, voiced opposition to any assistance, particularly financial, from any "Allied nations" to the Chinese Government. Arguing that the Government should receive no foreign aid until it had been reorganized on a democratic coalition basis, General Chou claimed that the existing aid would only augment disorders and suffering, and facilitate one-party rule.

During the fall and winter of 1945 the Communist press carried repeated stories charging American planes with strafing and bombing of Communist troops. On April 21 Communist newspapers charged that American planes had strafed Communist troops in the Seping-kai area and that Communist forces had found the body of an American airman in one plane that had been shot down. General Marshall branded the charges false and presented a memorandum to General Chou asking for proof of the charges or a retraction in the papers that printed the story. General Chou said he knew nothing of the incident.

The Export-Import Bank on January 17 approved a grant to China of a \$33,000,000 credit for the purchase of American cotton, with repayment to be made 24 months after the arrival of the cotton.

The Chinese stand with the Soviet Union on Manchuria was supported by the United States in a note sent by Secretary of State James F. Byrnes to the U.S.S.R. government on March 5. The contents of the notes were not divulged, but it was apparent that consideration was given to Allied interests where they were involved and the Open Door principle where economic rights were at stake. The note was based on Chinese objection to two Soviet moves; one was the reported Soviet removal of Manchurian industrial equipment on the grounds that it was war booty and other involved the proposal for joint Sino-Soviet operation of Manchurian industries.

The note was prompted by the Chinese response to a State Department request on February 9 for information on the Manchurian discussions. The Chinese answer on January 21 stated that all Japanese enterprises in the Chinese northeastern Provinces which had served the Japanese army were regarded "as war booty of the Soviet forces." Chinese refusal to adopt this view resulted in a Soviet note proposing to turn part of the Japanese enterprises over to the Chinese and to have the remaining enterprises operated jointly by China and the Soviet Union. United States attitude objected to private Soviet and Chinese negotiations on Manchurian industries because it was contrary to the Open Door Policy and contention also was made that disposition of Japanese assets was a matter to

be determined by an inter-Allied reparations commission.

The issue around the status of Manchurian industrial machinery brought a report on July 23 from Edwin W. Pauley, special reparations investigator for President Truman, that Soviet removals of key machinery in Manchuria had incapacitated more than \$2,000,000,000 worth of industry. Coal mines which provided the entire Far East with fuel were threatened by floodings, Mr. Pauley said, because generators used to provide power for drainage pumps had been removed during the Soviet occupancy. A request had been rushed to General Douglas A. MacArthur, the Supreme Allied Commander, to send power equipment from Japan to avert the mine floods, Mr. Pauley reported, but no action had been taken by the Far Eastern Commission.

Despite the expeditions of truce teams to the critical Manchurian areas, the civil war, fanned by political disagreements, flamed anew along the Peiping-Mukden Railway in northeastern China where Communists attacked to prevent Government troops from taking over Manchuria. The Communist *Emancipation Daily News* charged Chiang with attempting to perpetuate a personal dictatorship by rejecting the PCC agreements for cooperation with the Communists. On April 14 the rupture was pronounced by General Chou in a statement proclaiming the existence of all-out hostilities in Manchuria. Chou said that the move was made necessary by Government efforts to drive the Communists from Manchurian areas where the Russians had withdrawn. Two hours before the Soviet withdrawal in mid-April from the important city of Changchun the Chinese Communists launched a full-scale offensive that captured the city after several days of heavy fighting. The capture of Changchun marked Communist control of 70 percent of Manchuria's territory with a population of 26,000,000 of the total 38,000,000 inhabitants, according to Gen. Peng Chen, secretary general of Communist headquarters in Manchuria. Within a week the Communists marched unopposed into Harbin, then successfully carried their attack northwest to the important rail center of Tsitsihar, capital of Heilungkiang Province. After President Chiang moved his capital from Chungking to Nanking on May 1, where Sun Yat-sen, "father of the Chinese Republic" was entombed, new fighting broke out at Hankow along the Yangtze River.

As the epidemic of battle spread down through north and central China, truce teams composed of Kuomintang and Communist members with the staff of General Marshall's mission, strived to reach critical battle areas. They succeeded in negotiating cease-fire agreements on the Honan-Hupeh border in Central China and in Shantung Province. At the same time, however, the Government pushed an offensive against new Communist troop-massings in the North China provinces of Shantung, Hopeh and Jehol, which led to a breakthrough and the easy recapture of Changchun on May 23.

The return of Changchun to Government control paved the way for new negotiations. The gradual withdrawal of Soviet troops from Mukden, Manchuria's largest city, sparked a revival of a direct Nationalist-Communist military activity. On March 10, the Russians turned over their garrison duties to a force of 14,000 Nationalist troops that had been in Mukden for several weeks, awaiting their departure. On the following day street fighting broke out as the Nationalists declared martial law and awaited reinforcements.

The first "exchange of views" that took place in Nanking on May 25 was followed by a warning from General Marshall that China was "trembling on the verge of an even greater calamity" than World War II. He said it was "ironical that the people who endured the war longest should see peace restored to the rest of the world while they continue to suffer and starve in war-ridden surroundings." General Marshall's efforts were successful on June 5 when each side agreed to a fifteen-day truce for the purpose of finding a solution to the Manchurian crisis. President Chiang indicated that his armies would resume the fight, the *New York Times*, reported, unless satisfactory settlement was made for the following matters: Specific arrangements for the ending of hostilities in Manchuria; detailed arrangements and schedules for the restoration of communications throughout China, and a definite arrangement for the prompt execution of the February 25 agreement for the "demobilization, reorganization, and integration of the armed forces of China."

The truce preceded a period of negotiations, accusations, and counter accusations that actually left no road open to peace. The Government charged the Communists with breaking the truce by attacking in Manchuria, while the Communists made similar counter-charges. During an eight-day extension of the armistice, Gen. Mao Tze-tung, the Communist party chairman, demanded that the United States cease all military aid to the Chinese Government and immediately evacuate all American forces from China. Asserting that American presence menaced the security and freedom of the Chinese people, General Mao proclaimed Communist opposition to the further "selling and exchange of lend-lease goods and the presenting of arms by the United States Government to the Kuomintang dictatorial Government and the sending of a military advisory group to China."

General Marshall's plans to bring a Kuomintang-Communist rapport were blocked by a deadlock on the integration of the army and the assignment of various units to specific garrison areas. As the parley bogged down and negotiations were surrounded by a "no peace, no war" atmosphere, Government troops occupied Hsuan-huatián and trapped 60,000 Communist forces in a north Hupeh pocket. The truce was extended to June 30 as little progress was made.

During the several days lull in negotiations and fighting, announcement was made from Washington that President Truman had nominated Dr. J. Leighton Stuart, president of Yenching University at Peiping, Ambassador to China. Both Nationalists and Communists approved the selection of Dr. Stuart.

The frequent charges of abuses in the distribution in United Nations Relief and Rehabilitation Administration supplies in China was brought up for inquiry before the Agency's Council Committee for the Far East on June 9, which recommended at the time that the CNRRA, China's exclusive agency for the distribution of UNRRA supplies, cease its practice of financing itself through the sale of UNRRA supplies and through loans from China's Central Bank. The CNRRA operated on a yearly budget of 210,000,000,000 Chinese dollars (U. S. \$105,000,000) and, according to its own report, hoped to sell one-fifth of the UNRRA supplies for financing purposes. During the first six months of 1946 more than half of CNRRA operating expenses of 43,000,000,000 Chinese dollars came from the sale of UNRRA supplies, mostly flour.

The charges of mal-distribution were increased

when three hundred employees of UNRRA, representing sixteen nations, telegraphed Director General Fiorella H. LaGuardia a month later that the persistent misuse of supplies by the Chinese Government might justify the halting of food shipments. They charged the Government with using the supplies as a "political weapon" and not making sufficient effort to stop deterioration of large stores of food, pilfering and the siphoning of supplies into the black market, while Chinese in anti-Government areas starved. The Government was accused of crippling UNRRA operations and projects in many sectors by failing to provide funds. The message constituted the employee's reply to the Chinese Government, which had previously informed the United States State Department that J. Franklin Ray, director of China supplies, was "persona non grata" because of his criticism of the Government's alleged mishandling of UNRRA food.

Simultaneous with the report of this message, Director General LaGuardia announced the termination of shipments, other than emergency food, until goods in Chinese ports had been cleared into the provinces. After the ports had been cleared, he said, shipments would be resumed. He pointed out that China's allocation of \$560,000,000 was the largest of any nation and that the clogged ports could be attributed to bad inland transportation.

Charging the Government with political discrimination and inefficiency, Tung Pi-wu, member of the Yenán peace mission and former delegate to the San Francisco United Nations Conference, said that only one-half of one percent of all UNRRA supplies had reached Communist areas, where 26,000,000 of China's 42,000,000 "war victims" lived. Dr. T. F. Tsiang, chief of CNRRA, defended the work of his organization and contended that the ravages of war, not political discrimination, had blocked the flow of supplies to the interior. He styled Tung Pi-wu's allegations "misleading" since many of the Communist areas in the interior were difficult to reach, especially with the breakdown of communications and the military activities of both sides. Furthermore, he said, statistical percentages did not reveal the true situation because much of the UNRRA supplies included non-distributable components such as railroad locomotives and other functional equipment.

Because of the UNRRA and CNRRA policy in not endangering the lives of their personnel, the expanding scope of the civil war, particularly in northern China, curtailed much of UNRRA's operations. Activities in August had to be suspended in Taiyuan, capital of Shansi Province and Kaifeng, capital of Honan.

Secretary of Agriculture Clinton P. Anderson confirmed the "weakness" of the Chinese Government in handling relief supplies and corroborated the details of the July 9 order that cut China off from all UNRRA supplies except essential foods. Shipments to China dropped from 250,000 long tons in June to 65,000 long tons in August. By October LaGuardia only partially lifted the restriction on shipments into China, to the disappointment of CNRRA officials who claimed the ports were capable of handling a resumption of the full supply program.

As the summer heat drove both parties away from Nanking, the prospects for peace waned. Leaders of the Democratic League, the middle-of-the-road party, prophesied a full-scale civil war with the breakdown of negotiations. The deterioration of negotiations gave way to pessimism with the murder of two liberals, Professors Li Kung-po and Wen Yi-tu, in Kunming. Both men had ad-

vocated a coalition government and were influential in the publication of *The Democratic Weekly*.

In the Yangtze valley the civil war erupted anew as Mme. Sun Yat-sen, widow of the founder of the Chinese Republic, broke a two-year silence on July 22 by denouncing Chinese "reactionaries" who fomented the civil war. Declaring that the civil war, though undeclared, had already begun, she said that the reactionaries were fanning the civil war "because they hope civil conflict in China will incite war between the United States and the U.S.S.R., and thus, at last, crush the Chinese Communists." She said that the crisis was not a question of one side or the other winning, but of the unity and livelihood of the Chinese people. After saying that General Marshall's efforts to obtain peace had been "deliberately and systematically sabotaged by the forces of reaction . . . which hold positions of prominence in the leadership of the National Government," Mme. Sun called for an end to the "period of tutelage," inauguration of an agrarian reform program, withdrawal of American forces in China and discontinuance of loans and aid to Chiang until the government is representative of all China.

Mme. Sun's speech drew responses indicative of the sharp division of opinion on American policy. In China the bulk of the press ignored or gave negligible space to the speech. Dr. V. K. Wellington Koo, the newly accredited Chinese ambassador to the United States, speaking at a press interview in Washington said that Mme. Sun's views did not represent the opinions of "the great bulk" of the Chinese people and that the Government required the assistance of the United States to disarm and repatriate the Japanese and maintain the lines of communication. On the same day, Brig. Gen. Evans F. Carlson, retired leader of "Carlson's Raiders" in the Pacific warfare, strongly supported Mme. Sun's statements and her right to speak for the Chinese people. In Washington, officials indicated there would be no change in American policy in China until General Marshall so recommended. All shipments of arms and munitions on a lend-lease basis had ceased before June 30, they said, and no shipments would be made till Congress passed a bill approving American aid in training a unified Nationalist-Communist Army.

The civil war continued particularly active in the central provinces where Communist attempted to cut Government lines of communications in the Shantung and Honan provinces. A Communist proposal on July 27 to unconditionally end the civil war was rejected by Minister of Information Peng Hsueh-pei, Government spokesman, because it contained no solutions for the vital issues of Manchurian control, reorganization of the Communist-Kuomintang armies and the reopening of communications. On August 2 the Communists accused the Government of using American-made planes to bomb Yen-an, capital of the Communist party.

With the widening rift in the civil war and the tension caused by the presence of American troops and arms, the number of incidents and brushes between Marines and Chinese increased. Late in July seven Marines were kidnapped and subsequently released by the Communists as a protest measure against "unauthorized incursions" by the marines into Communist-controlled regions bordering North China's railway lines. This was followed by a Communist ambush and shooting affray with a Marine convoy along Tientsin-Peiping highway in which several marines were killed and wounded. The Communist spokesman pleaded self-defense

in the incident and urged the Marines to leave China. Any Communist hopes for Marine withdrawal vanished with a U.S. State Department announcement that the United States had no intention of withdrawing the Marines garrisoned in China. In commenting on the ambush incident, Admiral Charles M. Cooke, commander of the United States Seventh Fleet, said that the Marine convoy was hauling supplies for the Government's Executive Headquarters in Peiping and described one of the Marines' missions as the "reestablishment of stabilized conditions."

The growing intensity of the civil war and the failure of either side to make concessions brought an admission on August 10 from General Marshall and American Ambassador Stuart that "it appears impossible for the two sides to reach a settlement. . . . which would permit a general order to be issued for complete cessation of hostilities in all of China."

"Certain of the unsettled issues relate to military redistributions of troops. However, these apparently present less difficulty of settlement than the more fundamental issue concerning the character of local or county governments to be maintained in regions which would be evacuated as the result of military redistributions pending basic decisions of such matters by a constitutional assembly."

The joint statement was issued as stubborn warfare spread to parts of Kiangsu, Hopeh, Honan, Anhwei, Shantung and Shansi provinces and negotiators of both sides failed to surmount the impasse constructed by the following problem: before the Communists agreed to the integration of armed forces and a possible minor role in the new regime, they insisted on a thorough political settlement and activation of reforms; the Kuomintang, on the other hand, desired the military merger first because they feared that the Communists, supported by any great military force, would work to extend their hegemony over all China.

Four days later Chiang promised to end Kuomintang one-party rule and institute a constitutional Government without delay. Political disputes would be settled by political means, Chiang said, "but only if the Communists give assurance and evidence they will carry out the truce agreement, restore communications, respect decisions of the executive headquarters and integrate their army into the National Army." In outlining his new program, he said that the Governments new policy would include:

Quick termination of the present political Government and opening of the National Assembly on Nov 12;

Compliance and execution of the Political Consultation Council agreements;

Inclusion of all parties and non-partisans in the new Government;

Obedience to the January 10 truce agreements if the Communists withdraw from areas where they threaten peace and obstruct communications;

Protection and security to people and their properties.

Chiang sketched what he described as Communist violations of agreements and hoped the Communist party would "change its policy of seizing power by military force and transform into a peaceful party." "We must put down rebellions," he said, "and make China a peaceful democratic, unified, strong country."

Ambassador Stuart, in commenting on Chiang's speech, said that it did not remove the difficulties and that General Marshall and himself would not relinquish their roles as mediators, despite their inability to avert a spreading of the civil war. Rumors that General Marshall might leave China were dispelled by Acting Secretary of State Dean

Atcheson in Washington who emphasized that Marshall had no intention of quitting the mission and underlined the United States policy of maintaining Marines in China. In Nanking the Communists rejected the Generalissimo's plan for conviction of the Assembly because they had not been consulted and said his aim to put down rebellion was tantamount to saying he wanted war. Communist criticism was directed at General Marshall in radio and newspaper comments which placed on him part of the blame for the failure to end hostilities and charged him with abetting the Kuomintang "reactionaries" by countenancing lend-lease aid to the Nanking Government. The Communist party organ, *Emancipation Daily News*, then issued a call for all Communist forces and civilians living in Communist-controlled areas to mobilize all forces to shatter Chiang Kai-shek's offensive.

The state of "no peace, no war" continued as fighting flared intermittently and the American mission sought to bring peace. General Chou deplored United States aid to the Nationalists and promised an appeal to the United Nations if the United States did not alter its policy. The announcement by Minister of Information Peng Hsueh-pei that "some progress" was made in discussions between General Marshall and Chiang for ending the civil war accompanied reports that the Nationalists had captured Chengteh, capital of Jehol while the Communists took Tatung, in northern Shansi after a twenty-five day siege.

The sale of about 1,500,000 tons of movable equipment, with an original value of \$800,000,000, was made by the United States to China for the equivalent of about \$175,000,000. Two-thirds of the sale total represented cancellation of the United States debt, built up during the war, to China. Negotiated by Premier T.V. Soong and Thomas B. McCabe, U.S. Foreign Liquidation Commissioner, on August 31, the sale included trucks, ships, road-building machines, steel and electrical goods, motors, railway equipment, and prefabricated houses located in China and on Okinawa, Guam, Saipan, Tinian, and other islands. No aircraft, weapons, ammunition, or any non-demilitarized combat material were involved in the title of property to China. While General Chou condemned the sale as encouragement of the Kuomintang "war policy," Howard C. Petersen, assistant Secretary of War, said it "will relieve the Army and the United States taxpayers of heavy expenditures" involved in the care and handling of the property.

Hostilities extended into September with further deterioration of peace negotiations. Frequent mention was made by both sides for an end to the war, but neither could offer a basis acceptable to the other. Nationalist forces successfully moved into Manchuria toward Harbin and drove a wedge between Yen-an and Kalgan, the Communist stronghold cities. A walkout from the peace parleys by General Chou followed the Nationalist capture of Huayin, an important Communist base. Calling United States participation "neither fair nor impartial," he said appeal would be made to the United Nations to assume the role of mediator. On October, the Communists issued a communique notifying the Nationalists that a continuation of the advance on Kalgan would be interpreted as "public announcement of a total national split." The Government did not abate their offensive, but offered the Communists a series of "maximum concessions." In the projected State Council of the new interim government that was to have supreme authority, the Communists had demanded fourteen seats themselves and the Democratic League

which would give them a one-third veto power. The Nationalists offered thirteen seats, which did not quite make up a third of the anticipated forty seats. Secondly, the Nationalists proposed that the Communist forces be immediately incorporated into the Nationalist Army. The concessions were closed with the offer of immediate cessation of hostilities if the Communists agreed to the above proposals. Communist reaction coincided with their established policy of first halting the war, then making political and military agreements.

A ten-day truce offer made on October 7 by General Marshall and Ambassador Stuart was rejected by General Chou on the grounds that the Nationalists did not cease their drive on Kalgan and thus displayed no good intentions. Although Chiang accepted the truce, Chou claimed that the brief interlude would only serve to give Chiang time to reinforce his assault on Kalgan and strengthen his defense of Paoting, capital of Hopei Province, the object of a Communist drive aimed at diverting Nationalist forces from Kalgan.

Kalgan fell to the Nationalists on October 11, one day after Chiang Kai-shek's three-year presidential term had been extended by the Kuomintang and national conscription had been ordered resumed by the Government.

The apparent stalemate in negotiation activities was broken by Chiang on October 16 after conferences with General Marshall and Ambassador Stuart. In concrete proposals that called for a reopening of peace talks, he asked for a meeting of the Committee of Three under the chairmanship of General Marshall to plan military reorganization and a meeting of the Committee of Five under the chairmanship of Ambassador Stuart to discuss the formation of the new government. If the Communists accepted the following eight points as an understanding upon which discussions would be based, the Generalissimo promised to issue a "cease fire" order.

1. Restoration of communications to be immediately resumed in accordance with the agreement tentatively reached by the Committee of Three last June.
2. The method for settling disagreements among team members of the Executive Headquarters and commissioners of the Executive Headquarters to be in accordance with the agreements tentatively reached by the Committee of Three last June. (This agreement provided that American members of the commissions and field teams decided where teams would go and submitted independent reports.)
3. The tentative agreement reached last June for the redistribution of troops in Manchuria to be carried out according to a fixed schedule without delay.
4. Government troops and Communist troops in North China and Central China to continue in occupation of localities now under their control until agreement by the Committee of Three is reached for the redistribution, reorganization, and demobilization of the troops, Government and Communist alike, and for the unification of the armed forces in China.
5. Whatever understanding is reached by the five-man committee headed by Dr. Stuart, it is to be confirmed by the steering committee of the PCC (Political Consultation Conference) without delay.
6. Questions of local government, excluding Manchuria, to be settled by the newly organized State Council.
7. The Constitutional Draft Committee (of the PCC) to be convened immediately and the agreed draft to be submitted to the National Assembly through the National Government as a basis for its action.
8. Concurrent with the proclamation of the cessation of hostilities, which is to be effected immediately following the agreement of the Communist party to the foregoing procedure, that party is to announce its intention of participating in the National Assembly by publishing its list of delegates thereto.

Within four days General Chou and many non-partisans agreed to meet in Nanking with Kuomintang for peace discussions. The Communists, however did not alter their attitude toward American participation in China, for on October 24 they

radioed an appeal to the United Nation General Assembly to halt United States and to the Chinese Government and to "investigate American infringement of Chinese territorial integrity and security." Among other charges they accused the United States with building bases in China, giving arms to the Nationalists after the surrender of Japan, and attacking Communist-held territories. At the same time the Communist scored a decisive victory in the capture of Yulin, 100 miles north of Yen-an along China's northwest frontier.

The preliminary discussions at Nanking, strongly supported by the third parties of the Democratic League and the Youth movement, appeared to put little restraint on military activity for fighting continued in southern Manchuria as the Nationalists captured Antung, opposite Russian-held northern Korea, and pushed their attack to the Communist base of Chefoo. As negotiations lapsed again, the Nationalists sent a two-pronged attack down both sides of the Liaoning Peninsula in Manchuria toward Dairen and made several amphibious landings near Chefoo on the Shantung Peninsula. At the same time, the Communists rejected a plan of the third-party mediators which would allot them only three provincial garrison areas in northern Manchuria.

A five-year treaty of "friendship, commerce, and navigation" between the United States and China was signed in Nanking on November 4, placing China on equal basis with the United States. The United States Department of State stressed the fact that no political significance was attached to the pact nor did it intend to strengthen Chiang's Government in its strife with the Communists. Conversations toward the negotiations of the pact were begun before the surrender of Japan and the result gives recognition to China as a nation among the major powers of the world. Upon its ratification by the United States Senate and the Legislative Yuan of China, the pact will supersede the existing provisions of nine treaties that were concluded by the two nations between 1844 and 1928, but will not disturb the treaty of 1943, in which the United States relinquished her extraterritorial rights in China.

The outstanding provisions of the treaty included equal, reciprocal, and most-favored-nation treatment of the nationals, commerce, and corporations of each country within the other, free of discrimination or confiscation without compensation. Citizens, corporations, and associations of one country are permitted to reside, travel, and carry on trade in all parts of the other country, within the limits of existing immigration provisions. The right to carry on commercial, manufacturing, processing, scientific, educational, religious, and philanthropic activities is guaranteed so long as they do not conflict with the other country's laws. Also, the nationals of one country can acquire, erect, or lease buildings and lease lands for their activities in the other country. Finally, each country grants to the other the same rights to explore and develop mineral deposits as it gives a third nation.

In preparation for the meeting of the National Assembly, which was scheduled to convene at Nanking on November 12, Chiang ordered all his troops on November 8 to cease fire as of November 11, "except as may be necessary to defend their present positions." The order was issued to induce the Communists and other minority parties to participate in the Assembly, but both the Communists and the Democratic League rejected the overture. The Communists claimed that the stipulation concerning the defense of "present positions" might

serve as a pretext for military operations and later added that the convening of the National Assembly as scheduled would signal a complete national split. For several months the Communists had based their rejection of the Assembly meeting on the grounds that the Kuomintang violated the January truce agreement that called for a consultation of all parties to determine the opening of the Assembly.

After a three-day delay, the Assembly opened on November 15 with the Communists, the Democratic League and other third parties absent. The meeting was originally planned to convene before 2,050 representative delegates, but actually mustered 1,470, of which 85 percent were Kuomintang representatives. General Chou's assertion that the unilateral summoning of delegates marked the end of peace negotiations sent retail prices soaring to new inflationary levels as fear of an all-out civil war pushed civilians to frantically buying and hoarding food.

On November 20, the day after General Chou left Nanking for Yen-an and peace hopes dimmed, all truce teams were ordered withdrawn from Manchuria. The Communists qualified their departure from Nanking with the statement that negotiations could be renewed if a new inter-party conference were created, a new coalition Government organized and a new National Assembly convened. At the same time the Communists launched a counter-offensive in the Shantung Peninsula, capturing Pingtu and Changi.

The Assembly was offered the draft of the new Constitution on November 28 by Chiang who urged speedy adoption and said, "This presentation marks the end of responsibility of the National Government and the beginning of the Government by the people. Now that the Assembly has taken over, I have no more political ambition." Much of the Generalissimo's speech was devoted to explanations for the presentation of the new draft, rather than the Constitution drawn up in 1936. The new Constitution placed more limitations on the power of the President and modified many of the ideals of Dr. Sun Yat-sen, who inspired the original 1936 draft. In Dr. Sun's concept, the five branches (Yuan) of the Government—Executive, Legislative, Judicial, Control, and Examination—operated under the coordination of the President who enjoyed extensive powers. In the new Constitution, the five Yuan were retained in name, but a system of circumscribed executive responsibility to a popularly-elected Legislative Yuan was substituted for the five Yuan. The modifications changed the Control Yuan into an upper house, the Examination Yuan into a civil service commission, and the Judicial Yuan into a Supreme Court.

During the Assembly debates, in which several extreme right-wing members advocated a return to the old Constitution, the Communists announced from Yen-an that peace talks were impossible unless the Government dismissed the unilateral Assembly and withdrew its troops to the positions held on January 13. On December 7 the Communists refused to permit United States Consul General Edmund O. Clubb to take up his post in Communist-held Harbin "because of the present policy of the United States which provided assistance for Chiang to fight a civil war."

President Truman reaffirmed United States policy with respect to China on December 18, promising continued United States aid in assisting the Chinese people to "peace and economic recovery." Reminding China that the civil war threatened world peace and must be ended, the President

reiterated the United States recognition of the National Government. During his statement, which was essentially a recapitulation and defense of the United States attitude on the question of the Chinese civil war, the President said that the armed strength of the United States in China had been reduced from a peak total of 113,000 men in the fall of 1945 to less than 12,000. The seriousness of the problem, he said, justified the presence of General Marshall in China, "even though active negotiations have been broken off by the Communist party." Increasing the base of the National Government to make it representative of the Chinese people will further China's progress toward a united and democratic nation, he said.

The President's statement was issued a few hours after a proposal by two United States Senators, James E. Murray of Montana and Ralph E. Flanders of Vermont, that the Chinese situation be taken out of the hands of the United States as mediator and submitted to a conference of the United States, Great Britain, and the Soviet Union, within the framework of the United Nations and with General Marshall as chairman. When the conference had completed its work, the Senators said, the three powers "should declare themselves out of Chinese politics." American supplies had been identified in the eyes of the Chinese as a contribution towards the civil war, the Senators commented, and was giving rise to anti-American feeling in China.

On December 25 the National Assembly approved China's new Constitution, based on the principles agreed upon early in the year by the Chungking Political Consultation Conference of all parties. The existing Government of the Kuomintang was instructed to enact regulations for elections and eliminate all laws conflicting with the new Constitution within three months.

A Communist spokesman asserted that the Constitution would not be recognized by his party since, even in its original form, many details had not been agreed upon between the Communists and the Kuomintang. In the plans of the Assembly the Kuomintang would retain power until a new President was elected, but preliminary reorganization would take place with the leaders of the Young China Party, the Social Democratic Party, and independents joining in an interim Government.

In its final form, containing 175 articles, the Constitution provided for a President and Cabinet and called for the election of a Legislative Yuan (lawmaking body), a Control Yuan (Upper House) and a National Assembly, which will be named every six years and will elect the President and Vice President. The President is to be elected for a six-year term and is eligible for one additional term. He is empowered to appoint the head of the Cabinet, with consent of the Legislative Yuan.

Membership in the Legislative Yuan is to be based mainly on professions and geographical distributions. It will exercise restricted control over the Cabinet and, by a two-thirds majority, can force the Cabinet to comply with its desires. Election to the Control Yuan is to be made by Provincial Assemblies.

Providing for universal suffrage and secret ballot, the Constitution guaranteed equality of all persons, racial groups, sexes, or individuals regardless of party affiliations. "As prescribed by law," women will be allotted a definite number of seats in the National Assembly and Legislative Yuan. The Constitution prescribed normal civil liberties, but contained a proviso restricting freedom of rights in time of crisis.

The Young China and Social Democratic parties were formally invited to join the Government on December 30. On the following day President Chiang Kai-shek announced that he would continue to seek settlement through political means with the Communists.

Greater distribution of UNRRA supplies to Communist-controlled areas was announced by UNRRA officials late in December. Since Communist Zones had received only 2.76 percent of the tonnage of shipments distributed up to November 30, a special branch was created to allocate supplies worth \$75,000,000 to Communist areas by June 30, 1947, the termination date of UNRRA in China. Initial distribution of 600,000 pounds of clothing was scheduled to be dropped into Communist areas by United States Marine Corps planes.

**Economic Conditions.** China's transition from war to peace proved doubly difficult in the face of rising taxes and runaway inflation. Premier T. V. Soong, in his report to the executive committee of the Kuomintang, declared that China was facing an economic emergency "no less serious than the war itself," and that the prospects for early large-scale reconstruction were extremely distant.

The most destructive factor was inflation caused by a lopsided Government budget with steadily rising military expenditures, disrupted communications, slow resumption of foreign trade, and little production. In the first four months of 1946 the Government spent six times its revenue, 80 percent of it for the army. In many areas the civil war activities prevented farming which ordinarily would alleviate some starvation. By September, less than 50 percent of China's factories were operating.

The effect was to make wholesale prices soar to four thousand times the level of prewar prices and increase the volume of currency in circulation to 1,000,000,000,000 Chinese dollars, one thousand times the 1937 figure. The United States dollar on the open market was fixed at 2,200 to 1, but brought more than 4,000 to 1 on the black market. Since the end of the war the price of rice in Shanghai more than quintupled. In mid-January the price of rice stood at 9,850 Chinese dollars per 172 pounds; by May the price rose to 68,000 Chinese dollars, then was pegged at 50,000 Chinese dollars by the price control orders of the Shanghai municipal authorities. Following is the cost-of-living index for Shanghai workers:

Year and Month	(1936-100)
1945: December.....	84,507
1946: February.....	184,573
March.....	275,422
April.....	269,430
May.....	409,533

In August the official rate of the American dollar was increased to 3,350 to bring it into better relation with its actual buying power in China. The effect of the decree reduced China's demands one-third on the products of the rest of the world, with an equal effect on China's exports. The first signs were salutary; imports doubled in price while domestic prices rose about 10 percent, then steadied. As the rising prices of imports caused some discussion about a revival of China's own industries, Foreign Minister Wang Shih-chieh stressed the nation's eagerness to attract foreign capital and elaborated on the "Open Door" policy which would grant equal opportunities on a reciprocal basis to all nations without discrimination. However, by December it appeared that the adjustment in the exchange rate had failed. In September exports were approximately 25 percent of imports,

but dropped to about 9 percent in October. The initial advantage of the adjustment was gradually offset by a rise in domestic prices. In two of China's leading export items, bristles and tung oil, prices rose 65 percent by the end of September. The Government attempted to cope with this problem on November 17 by imposing a system of quotas on all imports. This effort was met pessimistically by Shanghai businessmen who estimated that imports would be reduced little by the measure since large-scale smuggling would bring in over-the-quota desired items.

**Production.** In 1945 the estimated output from China proper of cleaned rice was 39,500,000 metric tons, wheat 18,865,000 metric tons. During prewar years, China was the world's leading producer of rice, soybeans, tea, kaoliang, sweet potatoes, millet, and vegetable oils; it ranked second in the output of raw silk and wheat; third in cotton, and was an important producer of corn, tobacco, fruits, vegetables, and cane sugar, as well as being the chief exporter of eggs and tung oil. Wool and mohair are important products.

The principal mineral products of China include coal, antimony, tin, tungsten ore, white alum, arsenic, coke, copper ore, gold, gypsum, iron ore, pig iron, lead ore, crude petroleum, potash, quicksilver, rock and refined salt.

China's rapidly expanding manufacturing industry was disrupted by the war with Japan which started in 1937, but there was a considerable transfer of plants to the free provinces in the west. On June 30, 1944, Free China had a total of 4,346 factories registered with the Ministry of Economic Affairs.

**Foreign Trade.** In 1943, exclusive of bullion, imports were valued at CN\$3,314,324,000; exports, CN\$164,459,000. The value of the Chinese National dollar (CN\$) was set at US\$0.05 on July 10, 1942. Of the total imports, the United States sent commodities valued at CN\$590,806,000, Great Britain CN\$198,577,000, British India CN\$77,374,000. Of the exports, the U.S.S.R. took commodities valued at CN\$58,705,000, United States CN\$37,007,000, and British India CN\$8,403,000.

Imports in 1943 included dyes, pigments, paints, varnishes, books, maps, paper, wood pulp, cotton piece goods, chemicals, raw cotton, cotton yarn and thread, metals and ores, and armaments. The principal exports included animals and animal products, oils, wax, textile fibers, spices, fuel, stone, tea, raw silk, leather, chemicals, metals, minerals, piece goods, paper, cereals, and beans.

**Transportation.** Highways traverse China in all directions and internal trade is carried on partly over them and in part over the many canals and rivers. In 1943 there were 78,580 miles of roads in all China. Before the war there were 12,500 miles of railway. Telegraph lines in 1943 had a length of 59,275 miles. In the same year telephone lines had a length of 41,384 miles. A network of 4,500 miles of navigable inland waterways and a new canal linking Shanghai, Peiping, and Nanking are included in a 5-year reconstruction plan announced, on Dec. 16, 1945, by the Chinese National Reconstruction Plan.

JOSEPH P. BLANK.

**CHRISTIAN SCIENCE.** A system of metaphysical or spiritual healing set forth by Mary Baker Eddy in her textbook of the movement, *Science and Health with Key to the Scriptures*, first published in 1875. The first Christian Science Church was established by Mrs. Eddy in Boston in 1879. Ten years later it

was dissolved, and at the request of Mrs. Eddy, the present Church was organized in 1892, and named The First Church of Christ, Scientist. It is also known as The Mother Church. The total number of recognized branches of The Mother Church is more than 2,870. There are also 73 college and university organizations.

The affairs of The Mother Church are administered by The Christian Science Board of Directors under the Church Manual by Mary Baker Eddy. The Board of Lectureship of The Mother Church is engaged in delivering free lectures on Christian Science.

The Christian Science Publishing Society, whose affairs are administered by a Board of Trustees, also under the Church Manual, issues the international daily newspaper of the organization, *The Christian Science Monitor*. Other periodicals include: *The Christian Science Journal*; *Christian Science Sentinel*; *Christian Science Quarterly*; and five editions of *The Herald of Christian Science*, in the German, French, Dutch, Spanish, and Scandinavian languages, each with the English translation opposite; and also an edition of *The Herald of Christian Science* in Braille.

Luther P. Cudworth is President of The Mother Church for the year 1946-47. Headquarters are at 107 Falmouth Street, Boston 15, Massachusetts.

**CHRISTMAS ISLAND.** The name of two separate islands. (1) An island in the Indian Ocean, southwest of Java, a dependency of Straits settlements (see BRITISH MALAYA). Area, 60 square miles. Population (1941 estimate), 1,431. The island was occupied by the Japanese in 1942. In December, 1946, a mutiny trial of 9 sepoys said to have shot British officers at the time of the first Japanese invasion threat was begun in Singapore. (2) The largest atoll in the Pacific, over 100 miles in circumference, just north of the Equator and lying south of the Hawaiian Islands. It is included in the British colony of the Gilbert and Ellice Islands and is leased to the Central Pacific Coconut Plantations, Ltd., for a period of 87 years from 1914. Population in 1940, 11.

**CIVIL AERONAUTICS ADMINISTRATION (CAA).** A branch of the U.S. Department of Commerce which encourages and fosters the development of civil aeronautics and air commerce; encourages the establishment of civil airways, landing areas, and other air navigation aids and facilities; designates Federal airways and acquires, establishes, operates, and maintains air navigation facilities along such civil airways and at landing areas; makes provision for the control and protection of air traffic moving in air commerce; undertakes or supervises technical developmental work in the field of aeronautics; plans for the development of aeronautical facilities; and maintains and operates the Washington National Airport. The Administrator also enforces the civil air regulations (excepting the functions of the Civil Aeronautics Board, q.v.).

The locations for the construction or improvement of airports under this program are selected on the basis of their importance to national defense and to future civil aviation. The Administration advises the War and Navy Departments on the disposition of surplus war airports and State and local units of government on airport site selection, planning, development, and maintenance.

The Federal Airways System, which has been extended throughout Alaska, is being further expanded and improved to provide the type of dependable communications service and air naviga-

tion facilities required for the successful conduct of military operations in that area. Installations in Hawaii and the Pacific Islands, as well as in the Caribbean area, are now proving their military value. The Federal Airways System now comprises a network of more than 43,211 miles of "highways of the air."

Development work is proceeding in the fields of very high frequency communication and directional guidance facilities; monitoring equipment; flutter and vibration of aircraft components; engine nacelle fires; airport design and construction; soil testing and stabilization; airport lighting; obstruction marking by radio; traffic control; instrument landing systems; and aeronautical charts.

Administrator: Theodore Paul Wright.

**CIVIL AERONAUTICS AUTHORITY.** A division of the U.S. Department of Commerce. Its functions are discharged by the Civil Aeronautics Administration and the Civil Aeronautics Board (qq.v.).

**CIVIL AERONAUTICS BOARD (CAB).** A five-man non-partisan board organized independently within the U.S. Department of Commerce. It prescribes safety standards and regulations and has the power to suspend and revoke safety certificates, regulates air carriers, makes accident rulings and recommendations, and investigates accidents. Chairman in 1948: James M. Landis.

**CIVILIAN PRODUCTION ADMINISTRATION** was set up (by Executive Order 9638, October 4, 1945, effective November 3, 1945), succeeding the War Production Board. As the government agency charged with assisting the reconversion of American industry from a forced-draft, wartime productive machine to a stable, high-level peacetime economy, CPA began with a staff largely carried over from WPB and a philosophy that called for a minimum of government control and strong reliance on the cooperation of the business community.

With the war recently ended, factories were shutting down, dismantling their special-purpose machinery and rearranging production lines for the switch from weapons to civilian goods. In addition to the millions of war workers demobilized during this process, other millions were beginning to flow into the peacetime labor market from the armed forces.

The nation was faced with accumulated shortages—of homes, of automobiles, of clothes, of all kinds of products and even of the materials of which they were made.

To provide jobs for those millions of persons and to fill those accumulated needs, the CPA's job divided into two parts: revitalizing dormant civilian industries and assisting those which had converted to war work in setting up production lines for consumer goods. It was decided to follow the policy set by WPB of removing restricting controls as rapidly as possible, allowing business to operate under its own initiative with a minimum of government restrictions.

CPA's specific functions were to:

1. Expand production of materials in short supply;
2. Limit the manufacture of products for which the materials or facilities are insufficient;
3. Control the accumulation of inventories so as to avoid speculative hoarding and unbalanced distribution which would curtail total production;
4. Grant priority assistance to break bottlenecks which would impede the reconversion process;
5. Facilitate the fulfillment of relief and other essential export programs; and
6. Allocate scarce materials or facilities necessary for the production of low-priced items essential to the continued success of the stabilization program of the Federal Government.

To implement these objectives, CPA used priorities, allocations, conservation and limitation orders, directives, orders channeling materials into the most essential uses, and inventory controls.

There were many degrees of control of basic materials. All supplies of tin and lead, for example, were allocated by the CPA for critical and essential uses. Newsprint, on the other hand, was controlled only to the extent that users' inventories were limited to the minimum amounts needed for their operations. Inventory controls were retained from wartime to prevent hoarding of scarce goods which would exaggerate shortages.

Others, like steel, iron, rubber, chemicals, leather, fibers, and lumber, were controlled to varying degrees. In all cases where supplies fell seriously short of essential requirements, the most urgent needs were given first call.

The agency's "bottleneck breaking" priorities regulation facilitated the reconversion of the national economy, by helping new and small businesses and by giving special assistance for the production of critical reconversion products. Under this regulation, PR-28, a new producer or a small businessman who was not able to locate and purchase necessary equipment and materials and who was suffering real hardship could apply to CPA, and receive a priority that would enable him to purchase essential materials or equipment.

A list of critical products and materials needed throughout the economy and in short supply was maintained, so that manufacturers of items on the list could get priorities assistance for equipment or materials the lack of which was delaying production.

From the start CPA policy was to use its priorities and allocations tools sparingly, in the belief that wherever decontrol was possible, it would make for the greatest efficiency of operation and stimulate production to a higher degree. The agency worked closely with industry through the meetings of industry advisory committees and maintained liaison with industry through CPA executives.

Industries were kept informed of demand for their products and prospective supplies of materials and components so that realistic production schedules could be set up. Programs of critical importance to the nation were given special assistance by the means listed above.

Much of the year's activity centered around the following major programs and problems.

**Housing.** The War Production Board, faced with some estimates that six or seven million would be unemployed by Christmas, had lifted late in 1945 its order, L-41, which restricted construction during the war. This was done to spur the reconversion of a basic industry which seemed in need of all possible assistance if it were to provide jobs and undertake the tremendous task of civilian construction which had been delayed.

The construction industry recovered much more rapidly than expected; so fast that it outran production of building materials. There was not enough lumber, millwork, radiation, and other items. The lifting of L-41 let loose a flood of building, but home building lagged, partially because of the weather. Materials flowed into commercial and industrial jobs. Construction of low and medium-priced homes did not increase as fast as other types of building.

With the release of large numbers of men from the services, the already acute housing situation became a national emergency. The Civilian Production Administration set out to stimulate the produc-

tion of building materials and to channel them into homes for veterans.

To increase the production of tight building materials, CPA gave producers priorities for materials and equipment, worked with the United States Employment Service to recruit labor and direct workers to these plants, conferred with the Office of Price Administration concerning the adjustment of price ceilings to stimulate output, issued channeling orders and directives for pig iron and steel to building materials producers, launched a nationwide scrap drive including ship-breaking operations. Some regional officials even helped producers shop not only for production materials but for hard-to-get food items to feed employees.

Building materials production responded quickly and steadily throughout the year to the increasing volume and urgency of demand, to government measures listed above, and after mid-year to the premium payment plans and subsidies paid by other government agencies. The rates of increase on some of these production programs for building materials were comparable to performance on the military programs of high urgency during the war. In the year following V-J Day, monthly lumber production jumped 30 percent, bath tubs 285 percent, sinks 240 percent, cast iron radiation 171 percent, cast iron soil pipe 140 percent, brick 125 percent, and warm air furnaces 102 percent. Many others were being produced at increased monthly rates of 20, 50, 60, 70 or 80 percent.

The other course of action taken by the Civilian Production Administration was to channel materials into veterans' homes. The first action was taken along this line in December 1945, when CPA announced its program to give builders of homes for veterans HH priority ratings on some of the scarcest building materials. The builder was required to give veterans first option on sale or rental, and the units had to sell or rent within established price limits.

The same priorities regulation, PR-33, required building materials dealers to set aside certain percentages of their receipts of scarce materials each month to fill HH orders only. This helped somewhat, but the quantities of materials reaching dealers were not large enough for the parts "set-aside" to go far in alleviating the shortage of materials for veterans' homes. In March the issuance of the HH ratings was transferred to the Housing Expediter and handled through the Federal Housing Agency.

The next step in broadening the flow of materials to housing was to minimize competition for scarce building materials by eliminating as much non-housing construction as possible. On March 26, the Veterans' Housing Program Order 1 was issued. It required that all non-housing construction projects, above certain small amounts allowed for repairs, be authorized by CPA. Therefore 10 regional and 71 district offices were organized under the CPA Construction Bureau, in many cases staffed by the personnel of the old War Production Board field offices.

The only projects approved were those considered essential and non-deferrable from the point of view of the public interest, those which did not require the same materials as veterans' housing and therefore would not conflict with the housing program, and those where unusual hardship to individuals would result through no fault of their own if not permitted to proceed. The application of the criteria was progressively more restrictive, until in September the rate of authorizations was brought down to about 35 million dollars a week for the entire country.

The magnitude of the increase in construction activity is illustrated by the fact that employment in the construction trades doubled in the year, rising from one to two million.

**Clothing, Textiles.** Started in 1945, the low-cost clothing program was given added impetus in 1946 because of the needs of returning servicemen. Fabrics were allocated to manufacturers making clothing in specified low price ranges. However, with the ending of price controls, the program became unworkable, and was abandoned in November.

The famous order L-85 which restricted use of materials and limited changes in design of women's and children's clothing in order to conserve materials, was continued through most of the year. After several relaxing amendments, L-85 was lifted in October. Most other textile controls which channeled fabrics and components into the most essential clothing, industrial, and agricultural uses were revoked in November and December.

**Exports.** In view of the large export market and the fact that domestic demands for many things were far from being met, the Civilian Production Administration limited exports of scarce goods. In cooperation with the Department of State, the Office of International Trade, and other agencies, CPA reviewed foreign orders for scarce products and materials. Where the particular item was in short supply within the United States, export generally was limited to the minimum relief and rehabilitation commitments of the United States Government.

**Industrial Output.** Industrial production reached peacetime peaks in the late summer, despite earlier serious work stoppages. At the same time, civilian employment rose 11 percent, increasing from 51,600,000 in October 1945 to 57,400,000 in October 1946, a peacetime peak, as the country provided jobs for its demobilized soldiers and war workers.

After V-J Day, industrial production on the whole had fallen to about the prewar level. The increase since then has been principally in durable goods, which rose 30 percent during the year, while non-durable production held at about the same level throughout the year. In October the over-all level was about 25 percent below the all-time peak achieved at the height of war production in 1943, but still 12 percent above the average for the peak prewar year 1941.

October production of basic materials like coal, oil, steel, paper, and textiles was about the same as in 1943, but the total of industrial activity was less because military goods went through more plants and processes per pound of raw materials.

On December 5 President Truman accepted the resignation of CPA Administrator John D. Small, saying: "Now for several months we have been near to full-time employment, and we have reached a peak of production never before attained in time of peace. Your work, as originally assigned, therefore has been virtually complete."

To wind up the work, the President created the Office of Temporary Controls. See **TEMPORARY CONTROLS, OFFICE OF.**

JOHN D. SMALL.

**CIVIL SERVICE, U.S.** The year 1946 was a period of transition in Federal personnel administration. Special wartime regulations which were adopted in March 1942 to speed up the recruitment, examining and placement of workers in Federal agencies on a temporary basis were abandoned, and by the end of the year the civil-service system was well on the way toward return to a permanent, peacetime basis.

During the war, most of the peacetime Civil Service Rules were superseded by War Service Regulations, which were designed: (a) to speed up the processes by which workers were placed in jobs subject to the competitive requirements of the Civil Service Act of 1883 (merit-system positions); and (b) to preclude the filling of such jobs on a permanent basis at a time when millions of men and women were in the armed forces or in war industry, and were therefore unable to compete for Government employment. Appointments under these regulations were on a "war service" basis, "for not to exceed the duration of the war and 6 months."

On February 4, 1946, although the war had not yet been legally terminated, the President signed an Executive order directing the U.S. Civil Service Commission to resume the regular, peacetime practice of announcing and holding examinations for filling positions on a probational (permanent) basis, and authorizing the adoption of regulations to govern personnel transactions during the period that the Civil Service Rules were being revised. The order also directed the Commission to submit to the President recommendations for a revision of the rules. The release of men and women from the armed forces and from war industry had progressed to such a degree that the procedures adopted in wartime were no longer necessary.

Under authority of the February 4 order, the Commission issued Temporary Civil Service Regulations, which became effective March 7, superseding the War Service Regulations; resumed the practice of announcing civil-service examinations leading to permanent appointment; and began a program of displacement of war-service and other temporary employees. Recommendations for a revision of the Civil Service Rules have been submitted to the President. The rules are promulgated by the President to carry out the purposes of the Civil Service Act, and are administered by the Civil Service Commission, the central personnel agency of the Government. Approval of the revised rules will mark the full conversion of the merit system to a peacetime basis so far as regulations and procedures are concerned.

The first of the peacetime type of examinations were announced in March. Numerous others have been announced subsequently. Nation-wide examinations have been announced by the Commission's central office, Washington, D.C., to fill positions in such fields as physics, chemistry, engineering, drafting, agriculture, geology, geophysics, accounting and auditing, library science, forestry, dietetics, and stenography. Other examinations have been announced by the Commission's 14 regional offices, and by boards of examiners under the jurisdiction of the regional offices, to fill positions within the respective regions or in particular establishments, such as War and Navy Department installations.

After examinations are held, registers of eligibles are established. Eligibles are certified from these registers to fill vacancies in positions of the kind for which the examinations were held, and to replace employees in such positions who do not have permanent tenure.

When the War Service Regulations were abandoned, the Commission had almost no lists for regular civil-service appointments. It was necessary to start at the beginning in establishing such lists. It will take the Commission many months to give examinations and establish lists of eligibles for all the hundreds of types of positions that exist in the Federal service. Vacancies in positions in each of the various occupational groups will be filled on a temporary basis, directly by the Government agencies

in which they exist, until it is possible to fill them on a permanent basis from registers of eligibles established in accordance with the Temporary Civil Service Regulations or (after these have been superseded) the Civil Service Rules. A register may be established as the result of an open competitive examination, or it may consist solely of (a) the names of disabled veterans who qualified in an examination open to them only and (b) the names of persons who lost opportunity for appointment from a previous register by reason of service in the armed forces.

Veterans receive preference in appointments, whether temporary or permanent. In making temporary appointments, pending the establishment of registers by the Civil Service Commission, Federal agencies are required to adhere to regulations issued by the Commission which provide that preference shall be given, first, to qualified persons entitled to 10-point preference under the Veterans' Preference Act of 1944; second, to qualified persons entitled to 5-point preference under that Act; and, third, to qualified former Federal employees who are not entitled to veteran preference. In examinations for permanent appointment, 5 or 10 points are added to the earned ratings of persons entitled to veteran preference. Non-disabled veterans receive 5-point preference. Disabled veterans, the widows of veterans, and the wives of disabled veterans receive 10-point preference.

The Federal Employees Pay Act of 1946, effective July 1, 1946, brought about a 14-percent increase in the base pay of most Government workers whose positions are subject to the Classification Act of 1923. (The largest groups of employees whose positions are not subject to the Classification Act are those in the Postal Service and those in the mechanical trades and crafts.) The pay act contains provisions for absorbing a major part of the cost of pay increases granted to employees in the executive branch by requiring gradual reductions in the number of such employees during the period from July 1946 to July 1947.

On November 1, 1946, the latest date for which statistics are available as this article is written (December 1946), the number of Federal employees was 1,335,100 less than at the wartime peak shortly before V-J Day. This was a 35 percent cut in civilian workers in the United States and elsewhere since June 30, 1945, when 3,770,000 persons were employed. On November 1, 1946, the total was 2,434,900.

Most of the reduction during the 16-month period occurred in the War Department, the largest Federal agency, which cut its rolls 63 percent—from 1,881,000 to 700,600. A 49-percent drop in the Navy Department lowered its civilian workers from 753,000 to 383,600.

On the other hand, military demobilization resulted in a rapid growth in the Veterans' Administration. This agency increased from 65,000 to 209,500 during the 16-month period. The Post Office Department, second largest agency, also expanded. Postal employees increased to 495,600—a gain of 116,800, or 31 percent.

The other regular and emergency agencies combined employed 645,600 persons—about one-fourth of all Federal civilian employees—at the beginning of November 1946.

Since V-J Day, the number of employees separated from the rolls in reduction-in-force programs has been large, but by November 1946 decreases due to reductions in force had exceeded the number of resignations in only one month. (A "reduction in force" takes place whenever one or more

Federal employees are involuntarily separated from the rolls of an agency in order to reduce personnel for such reasons as decrease in work, lack of funds, limitations on number of employees, reorganizations, and the necessity of making positions available for veterans and other returning employees with reemployment rights.) The order of separation in a "reduction in force" is determined by tenure of employment, veteran preference, length of service, and efficiency ratings. Active service in the armed forces of the United States is credited in determining a veteran's total length of service for "reduction-in-force" purposes.

Between September 1945 and September 1946, 25 to 45 percent of the separations each month resulted from "reductions in force." In October 1946, "reductions in force" accounted for 38,000 separations (34 percent). Resignations continued as the major type of separation, numbering 46,600 (42 percent).

The number of persons added to the rolls of Federal agencies in October 1946—74,000—was the smallest for any month since before the war. Moreover, in the same month about 111,200 employees were separated from full-time positions.

About 825,900 veterans—39 percent of Federal civilian employees—were employed in the Federal civil service in the continental United States at the end of October 1946. A year previously, 484,600 veterans—19 percent of the total number of employees—were employed. Two-thirds of the veterans in Federal agencies served in World War II. This group of veterans numbered 549,600 in October 1946—4 percent of the 13,853,000 veterans of World War II reported by the Veterans' Administration.

HARRY B. MITCHELL.

**COAL.** Bituminous coal's importance in the economy of the United States was driven home by a two-months miners' strike during April and May which left scars unhealed through the balance of the year in widely diversified sections of industry. A second work stoppage, lasting from November 21, 1946, to December 7, 1946, further disrupted economy.

The first strike began April 1 on failure of bituminous mine operators to reach an agreement with the United Mine Workers union on increased wages and other demands including a levy on each ton of coal mined, to establish a union-administered miners' health and welfare fund, unionization of mine foremen, and revised safety regulations. Within two weeks, steelmaking operations began to be gradually curtailed for lack of coal for production of coke. Coke is essential to the production of pig iron, base material from which most steel is made. By mid-May severe restrictions had been placed on use of electricity generated in coal-fired steam plants, throttling commerce and industry in some sections of the country. Freight shipments on coal-burning railroads were restricted to foodstuffs and vital supplies. Steel operations continued to drop, finally down to 44.5 percent of capacity. On May 13 a two-weeks truce was effected between union heads and operators but few miners returned to work and on May 20 the government took over control of the mines. The strike did not finally end, however, until May 29, when the government signed a contract with the union providing an 18½ cents per hour wage increase, a jointly administered health and welfare fund financed by a five cent levy on each ton of coal mined, and other provisions. An estimated 90,000,000 tons of coal production and 5,800,000 tons of steel output was estimated to have been lost, due to the strike.

Failure of mine owners to reach agreements with the union caused the government to remain in charge of mine operations throughout the rest of 1946. The union's head, John L. Lewis, requested negotiations with the government for further wage adjustments in November. Following inability to agree, Lewis notified the government that he would consider the union's labor contract terminated November 20, 1946. Ignoring a Federal court restraining order ordering Lewis and the union to revoke the contract termination notice, the miners struck November 21. On December 3, Lewis and the union were convicted of civil and criminal contempt of court, with the union being fined \$3,500,000 and Lewis, \$10,000. Pending appeal to the U.S. Supreme Court, the miners were called back to work December 7, 1946.

Principally as a result of the strikes, 1946 bituminous coal production was only 527,000,000 tons (1945: 570,000,000 tons). Anthracite coal mines, with only an eight-day work stoppage ending June 7, produced about eight percent more than in 1945, with a total of about 60,685,000 tons.

With the government operating the mines on a temporary basis in the United States, permanent socialization of mining appeared certain in most European countries. Following passage of a coal mine nationalization bill in Parliament in July, the British government expected to take ownership January 1, 1947. A coal industry nationalization bill for France was voted in June. Shortage of coal on the European continent, estimated to be 44,000,000 tons for the year starting July 1, 1946, not only restricted industrial production but left most homes with little or no heat. Lack of food for miners and slow reconstruction of railroads for distribution were major elements in holding down production in the Ruhr, major coal mining center in Western Europe. Production from the great Silesian mining region went entirely to Russia. Control of the Saar Basin mines went to France.

Beehive coke production, roused from semi-dormancy by heavy wartime coke demand, declined 17 percent from 1945 to 4,344,800 tons (1945: 5,213,893 tons).

CHARLES T. POST.

**COAST AND GEODETIC SURVEY.** A branch of the U.S. Department of Commerce. In addition to surveying and charting the coasts, it compiles tide and current tables, aeronautical charts, magnetic information, seismological and gravitational and astronomical observations. Director: Leo Otis Colbert.

**COAST GUARD, U.S.** The Coast Guard's two dominant peacetime functions of maintaining maritime safety and enforcing law on the navigable waters of the United States and its possessions and at sea, became paramount with the return of the Coast Guard to the Treasury Department on January 1, 1946, after it had operated as part of the Navy for four years and two months. Air Sea Rescue functions, including the operation of their accompanying navigational aids, such as medium and high frequency direction finder stations, continued until June 30, 1946, under the directional control of the Navy, as did the operation of mid-ocean weather stations.

At midyear, 1946, the eleven Coast Guard air stations, with their 195 fixed wing and 31 rotary aircraft, came once more into Coast Guard operational control. Most of the aircraft, however, continued to be Navy-owned. On September 5, 1946, the Air Sea Rescue Agency, inter-departmental group for the study of improved and standardized

rescue and search methods, headed by the Coast Guard Commandant, was renamed the Search and Rescue Agency. On the same date such ocean weather stations as remained from the extensive net maintained by the Navy during the war were transferred to the Coast Guard.

By the end of September, 1946, Coast Guard crews had been removed from all of the 352 Navy and 299 Army vessels they had manned during the war; of the 760 Coast Guard cutters of 65 feet or over which were in operation during the war only 269 remained by June 30, 1946, together with 1,395 motor lifeboats and motor boats, reduced from a peak of 7,960 on January 1, 1943. Its shore establishments such as training stations, air stations, bases, depots, lifeboat stations, resident light stations, primary radio stations, stores, academy and yard whose 1941 total of 831 units had grown to 2,237 at the peak of the war effort, had been reduced to 798 at the end of the fiscal year 1946. Many lifeboat stations were in a limited caretaker status due to personnel shortages. The number of aids to navigation including lighthouses, lightships, radiobeacons, buoys, and daymarks had increased from 31,006 to 36,879 during the war.

Military personnel, including officers, warrant officers and enlisted men which had increased from 19,090 on June 30, 1941 to 171,192 on June 30, 1945, numbered only 26,046 a year later. Recruiting stations, reduced from 29 in 1941 to 14 in 1946, enlisted 10,020 men during that fiscal year, with only one recruit training station remaining at Mayport, Florida. Membership in the non-military Coast Guard Auxiliary, an organization of owners of motorboats, yachts, aircraft and radio stations promoting safety among motorboat and yacht operators and voluntarily augmenting meager complements of under-manned lifeboat stations and patrol boats, numbered 44,963 on June 30, 1946, embracing affiliation of 13,239 boats, 33 airplanes and 7 amateur radio stations.

With wartime port security ended at the beginning of 1946, the Coast Guard continued to enforce, under the Espionage Act of 1917, its regulations, recodified on a peace time basis, governing the anchorage and movement of vessels and, on an ever diminishing scale, the loading and unloading of explosives and other dangerous cargo. At the end of the fiscal year, small details of officers remained on duty in the European and Pacific theaters of operations, and at two Army and one Navy ordnance depots on the Atlantic and Gulf coasts, supervising the reshipment and unloading of dangerous cargoes of ammunition and explosives being returned to the United States.

Emergency ship construction declined rapidly after V-J day (August 14, 1945) but by the end of the 1946 fiscal year 693 new vessels of a total of 3,210,798 gross tons had been constructed during the year and certified by the Coast Guard as meeting safety regulations. With the decline in new construction, however, came an increase in inspections incident to repairs, conversions, and the alteration of transports to passenger vessels, which more than offset it. In addition, annual inspections were made of 8,005 merchant vessels, 488 of Government vessels, 648 of boilers on Government ships and 976 of boilers in Government shore establishments. Added to this were 7,447 drydock examinations of craft under construction, repair or conversion, 2,164 re-inspections and 126 special surveys on passenger vessels not classified. Coast Guard Inspectors at manufacturing plants examined boilers, lifeboats, liferafts, line throwing guns and other safety appliances. There was a marked

reduction in the number of waivers granted, involving risks in maritime safety which could well be taken to expedite war commerce, and efforts are being made to bring vessels into full compliance with the law by the time the second War Powers Act expires on March 31, 1947. The Coast Guard had laid emphasis on securing compliance with navigation laws through education and cooperation rather than upon assessing penalties, except in cases of wilful violations.

During 1946, as an evidence of returning peaceful conditions, 27,307 more motorboats were numbered than during the previous fiscal year bringing the total to 411,310. By Presidential Proclamation on December 21, 1945, the Coast Guard resumed cognizance in the interests of safer loading over the observance of the provisions of the International Load Line Convention, suspended since August 9, 1941. Merchant marine hearing units afforded prompt and fair hearings to merchant marine personnel in all important United States ports and at foreign ports located in Europe, the Philippines, China and Japan. They investigated 34,258 cases of misconduct, negligence and incompetence and as a result 1,001 officer licenses and 6,352 seaman certificates were either suspended, revoked or the holders placed on probation for definite periods.

In March, 1946, the North Atlantic Ocean Patrol was organized, its activities embracing direction over the International Ice Patrol, Greenland Patrol, Ocean Weather Patrol and such aids to navigation as the Coast Guard still maintained in Labrador, Greenland, and Newfoundland.

JOSEPH F. FARLEY.

**COCOA.** Probably one of the most eventful years in history was witnessed in the cocoa market in 1946, featured by rising prices and a definite shortage of cocoa beans—the basic raw material of the chocolate industry. At the close of the year, spot cocoa beans in New York were quoted at approximately 25 cents per lb.—the highest price in forty years.

Although the end of the war brought increased production in West Africa (which produced about 60 percent of the world's needs) it found the consuming world with bare shelves and a universal desire to build up vanished inventories of cocoa beans.

The situation was particularly acute in the United States where record demands encountered a stockpile that was never more than a few weeks' needs as compared with prewar years when this country carried six months to a year's supplies on hand at all times.

The shortage, which grew continually more painful for the American chocolate manufacturers as the year progressed, was best reflected in the trend of prices. For the first half of the year, the market was at 8.86¢ per lb., which was the ceiling established at the start of the war and maintained throughout and after hostilities. When the OPA lapsed late in June, prices shot up and the market was 13.86¢ bid on July 19. When the revived OPA went into effect on July 25th, the market price returned to 8.86¢. The OPA ceiling was raised to 14.95¢ effective October 2 but underlying demand was so great that there was enormous demand at 14.95¢ immediately, with virtually nothing offered at that price.

When complete decontrol eventually came, prices advanced steadily, reflecting the shortage of supplies and by the end of the year was at the forty-year high of approximately 25 cents per lb. for spot supplies.

The United States trade was particularly per-

turbed by the action of the British Government in embarking on a policy of continuation of wartime controls as a permanent measure. The trade contended that control and allocation of the all-important British Colonies' production constituted a monopolistic control of the world's principal source of this raw material of the chocolate industry. However, despite mass meetings of the trade in New York and protests to the British Government and the American State and Agriculture Departments, the British Government continued to dole out cocoa beans sparingly to the United States market as the year drew to a close.

To the American consuming public, it meant higher and higher prices for chocolate bars and other chocolate candies. It meant confusion to the American manufacturers who were forced to operate and plan ahead with raw materials on a hand-to-mouth basis.

Imports of cocoa beans into the United States for 1946 amounted to about 4,100,000 bags compared with about 4,500,000 bags for 1945. Stocks in licensed New York warehouses at the year's end were about 175,000 bags.

**COFFEE.** During the war period, price controls were rigidly imposed on coffee not only at the consumer level, but on the green coffee purchased from the producing countries of Latin America. The prices that could be paid to producers for various grades of coffee were frozen on December 11, 1941.

In the early days of the war these ceiling prices were satisfactory. However, both the cost of production and the cost of living advanced in the producing countries and United States ceilings on coffee became more and more objectionable to the producers. The result was international friction, ill will, and difficulty in the trade because of withholding of supplies. This was especially true of the better qualities of coffee.

After long negotiations between officials of the producing countries, the Inter-American Coffee Board, the Department of State, and other United States government agencies, a subsidy to offset the increased cost of production of coffee was approved on November 19, 1945. This subsidy, amounting to 3 cents per pound was paid by the Reconstruction Finance Corporation to coffee importers, and increased the return to coffee producers without changing the price of coffee in the United States.

During the 25-day period after June 30, 1945, when the OPA lapsed temporarily and price control was not in effect, the price of green coffee advanced about 8½ cents per pound. A few weeks after OPA was back in power this reality was recognized. The prices OPA established on August 12, 1946 were the average prices at which coffee was purchased during the non-control period—an increase of about 8½ cents per pound.

A free market having once been tasted, this expedient was not too successful. On October 17, 1946, the OPA granted a formal petition for de-control submitted by the Industry Advisory Committee of the National Coffee Association.

The return to a free market in coffee has eliminated most of the difficulties and frictions which had developed as a result of controls on prices. The coffee industry is in a better position to serve the American people with the quality of coffee they want. The market price of coffee, moreover, leveled off at a point not significantly higher than the last increase which was granted by the OPA.

Despite wartime difficulties in price and supply, never before in history has coffee consumption in

the United States reached the high levels registered during the quota year, October, 1945 to September, 1946. According to United States government figures, coffee consumption during that period amounted to 19,930,000 bags of 132 pounds each. This was an increase of 17.4 percent over the previous record, made in the quota year 1944-1945.

These figures indicate that, by latest count, the American people are consuming 19.7 pounds of coffee per capita per year, two pounds more each than they did the year before. The present total has never been equalled in any calendar year, quota year, or other twelve-month period. The United States is the greatest coffee-consuming country in the world, consumption having increased by 56 percent since 1937.

To the coffee producers of Latin America, who during 1946 supplied the United States with every bean of coffee consumed here, these increases have meant a total increased sale of more than forty million bags in the past nine years, and an increase in dollar sales volume of about 650 million dollars. These large coffee exports to the United States mean ever higher standards of living for the Latin American people, and increasing financial resources with which to buy the elements of a better life.

A healthy export trade in coffee means, in turn, increased imports from the United States. In the prewar year of 1939, with trade depressed by international difficulties, Latin American world-wide imports exceeded \$800,000,000. When wartime restrictions are lifted, the possibilities of inter-American trade are limitless.

J. ROSENTHAL.

**COLOMBIA.** A republic of South America. Area: 439,825 square miles. Population: 9,807,000 (1943). Capital: Bogotá.

The Andes, intersected by high plateaus and deep river valleys, form the western third of the country; the remainder consists of plains watered by the Orinoco and Amazon Rivers. The climate varies with the altitude, low areas having tropical heat, plateaus temperate climate, and the high mountain regions cold to frigid temperatures.

**Population.** The majority of the population of Colombia is mestizo; the rest are persons of European descent (15 percent); Indians (10 percent); and Negroes (5 percent). The group of Negroes and Negro mixtures has been estimated at about 30 percent. Most of the people live in the Magdalena River valley in the mountain belt; population density is low in the coastal regions, and very low in the lowlands of the Orinoco and Amazon. Colombia's largest cities are: Bogotá, 395,000; Medellín, 198,000; and Barranquilla, 183,000.

The official language is Spanish. The predominant religion is Roman Catholic.

According to the census of 1938, 43.4 percent of the population over 10 years of age is literate. In 1943 there were 19,901 primary schools with a total enrollment of 679,273; 58,980 students were enrolled in 776 secondary schools; and 7,635 students were enrolled in 63 colleges and universities.

**Government.** Under the Constitution of 1886, Colombia is a centralized republic of 14 Departments, 4 Intendencias, and 6 Comisarias. It has a bicameral Congress composed of a Senate of 63 members and a Chamber of Deputies of 131 members. The congress holds two regular sessions a year; the first opens on Feb. 1 for 90 days and the second begins on July 20 and meets for 120 days. The President is elected for a 4-year term, and is aided by a Cabinet of 10 ministers. Alfonso López Pumarejo was elected President on

Aug. 7, 1942 for his second term (he previously served from 1934-38). In August, 1945, President López resigned, and Dr. Alberto Lleras Camargo, First Presidential Designate, became President to complete the term ending Aug. 7, 1946.

**Events, 1946.** In an election on May 5, marked by unusual serenity, Colombians voted in their first conservative president in 16 years. Mariano Ospina Pérez, 55 year old millionaire businessman and Senator, profited by a split in the Liberal Party and captured the presidency over his two Liberal opponents, Gabriel Turbay, supported by the official Liberal Party, and Jorge Eliecer Gaitán leader of the Independent Liberal faction.

Were it not for the schism, the Liberal Party would have had no difficulty in seating its candidate. Tabulations at the end of May gave Pérez 523,523; Turbay, 401,121; and Gaitán, 332,563.

Since 1930, the Liberals had given Colombia a progressively-aimed administration. After the 1942 election which seated young Dr. Alfonso López, Colombia's relatively placid government was ruffled by rumors of scandals involving members of López' family, successive Cabinet resignations, determined co-aspirations of various Liberal Party leaders for the presidential nomination, an abortive military coup and the tendency of López to push his progressive program aggressively over all opposition. Finally, López resigned in 1945, a full year before his term expired. The Liberals selected Alberto Lleras Comargo, young Minister of Government, to rule the interim government and then fell to bickering over a new candidate, while the Conservatives happily viewed their comeback possibilities. During the campaign, Ospina Pérez spent his time wooing the dissatisfied Liberals who felt that Gaitán's program was too radical and opposed Turbay (Former Ambassador to Washington) because he was of Turkish descent.

The new President, comfortable in a record of conservative politics, encountered strong opposition from the Liberal majority in Congress, who decided to refuse Government posts and were intent on rejecting all Conservative-inspired measures.

In a post-election statement Pérez offered his hand to the opposition and said his Administration would represent all Colombians and endorsed the social legislation put into effect by the Liberals. During his campaign, he declared himself in favor of collaboration between the Liberal and Conservatives and envisaged a Coalition Cabinet.

During a visit to Washington, D.C. early in June, President-elect Pérez expressed the desire to place his Government on a wide plane of national and political unity after his inauguration on August 7, and invite more Liberals into his Cabinet than was permitted to the Conservatives by Provisional President Lleras Comargo. He also declared that the immediate aim of his government would be the creation of a social security system to provide benefits for industrial and agricultural workers in sickness, old age, maternity, and industrial accidents.

On his return to Bogotá, Pérez declared that his new Cabinet would be divided equally between Liberal and Conservatives as would be the Governorships of the fourteen states. In a joint session of Congress on August 5 Carol Arango Velez, Ambassador to the Vatican and a Liberal, was elected Vice President.

At the outset of his new Conservative Government, President Pérez found himself in the midst of labor and political troubles that lasted throughout

the remainder of 1946. In early October, Colombia's 15,000 oil workers went on strike in protest against the refusal of the oil companies to grant substantial wage increases and were later joined, in sympathy, by Bogotá's bus and taxi drivers. In November 14 the Liberal majority in Congress defeated, 59 to 26, a proposal for Liberal cooperation with the Conservative Government. The five Liberal Cabinet ministers immediately resigned and were followed by the Liberal Governors of several states. To permit the President to completely reorganize the Cabinet, the Conservative ministers also submitted their resignations.

Adding two new ministers, Hygiene and Justice, President Pérez reorganized the Cabinet on December 12, on an equal coalition basis to include the following:

Minister of Government—Roberto Urdaneta, Conservative; Finance—Francisco de Paula Pérez, Conservative; Public Works—Dario Botero Isaza, Conservative; Education—Miguel Jimenez López, Conservative; Posts and Telegraphs—José Vicente Davila, Conservative; Minister of Justice—Arturo Tabias Pilonieta, Conservative; Minister of War—Carlos Sanz de Sentamaria, Liberal; Foreign Relations—Carlos Lozano, Liberal; Ministry of Mines—Tulio Enrique Tascon, Liberal; Hygiene—Dr. Jorge Bejarano, Liberal; Labor—Dias Herrera Anzoategui, Liberal; Economy—Roberto Marulanda, Liberal.

Congress adjourned its regular 1946 session on December 16 and included among its accomplishments the stimulation of agricultural production through irrigation projects, wide electrification and several measures for social improvement. A 1947 budget of \$170,235,000 was approved.

**International Relations.** Colombia shied away from any solo intervention methods in rejecting a Uruguayan plan on January 4 that proposed hemispheric intervention in the affairs of an American nation that failed to follow democratic practices. In the reply, the Foreign Office stated that while Colombia adhered to the policy of non-intervention, she would consider suggestions comparable to the Uruguayan plan in connection with the forthcoming Pan-American security conference.

During February, Colombia and Canada signed a most-favored-nation commercial treaty, which took into consideration the sterling commitments of the Dominion and included the exchange of newsprint, automobiles, and pharmaceuticals from Canada for coffee and vegetable products from Colombia.

A Gran Colombia, the plan for a coalition between South America's northern states, first conceived in 1822, received new realization in January when Colombia, Venezuela, and Ecuador adopted the idea for a combined merchant fleet. According to the plan, Colombia and Venezuela will each subscribe 40 percent of the 50,000,000 pesos (U.S.-\$28,000,000) capital and Ecuador 20 percent. All will contribute personnel and ships.

Actually the interest in the Gran Colombia idea was evident during the war when the three countries acted simultaneously on withdrawing their representatives from Vichy, France, in September, 1942; in recognizing that Czechoslovak government-in-exile in January, 1943; in reserving the rights of their nationals in Axis-dominated areas and in recognizing the French Committee of National Liberation in July, 1942.

After Simón Bolívar liberated the countries from Spanish rule in 1822 and until 1830 when they separated into the states they are today, the countries were incorporated into the Gran Colombia.

**National Economy.** Colombia is chiefly an agricultural country. The most important crop is coffee, of which Colombia is the second largest producer in the world. Other leading crops are: corn, sugar, bananas, wheat, rice, and potatoes. The pastoral industry is also of considerable significance. Coffee production for the 1944-45 season reached a total of 727,518,000 pounds. Estimated annual production of corn is 650,000 tons, and of potatoes, 418,000 tons. Estimated production of wheat in 1944 was 100,000 metric tons; of rice, 121,000 tons of paddy rice, or 65,045 tons of polished rice. Sugar production in 1944 totaled about 88,000 short tons.

Colombia has extensive mineral resources. Petroleum provides the second most valuable of the country's exports. Total crude oil production during the 1945 fiscal year amounted to 21,980,147 barrels, compared with 13,261,065 barrels in 1943. Of the total \$176,159,720 invested in the oil industry, only 8 percent is Colombian capital. Colombia also produces gold and platinum; production in 1944 amounted to 553,531 troy ounces of gold, and 34,259 troy ounces of platinum. Copper, iron, and emeralds are also important mineral products.

There is little heavy industry, but Colombia manufactures a variety of products. The year 1944 was notable for continued commercial and industrial development. Principal commodities manufactured include: textiles, leather, beverages, cigarettes, glass, perfumery, cement, brick, pharmaceuticals, and clothing.

**Foreign Trade.** In recent years Colombia's foreign trade with countries in the Eastern Hemisphere has declined, while trade with western hemisphere nations has greatly increased. Total exports for 1943 were valued at 218,525,000 pesos. Principal products exported, by value, were: coffee, crude petroleum, dyed cotton cloth, cattle hides, cattle, and platinum. The U.S. received 85.6 percent of the total exports to western hemisphere countries. During the 1944-45 coffee quota year a total of 5,185,517 sacks of 60 kilograms each were exported from Colombia, of which 4,696,255 sacks went to the U.S., and 71,911 sacks to Europe. The value of coffee exported in 1944-45 exceeded 177,000,000 pesos. Exports of petroleum in 1944 were valued at 37,317,000 pesos.

In 1943 total imports were valued at 146,692,000 pesos; the U.S. was the principal source of supply. In that year leading imports by value were: raw cotton and waste, rubber tires and tubes, dyed wool yarn, cotton thread, newsprint, and wrapping paper.

JOSEPH P. BLANK.

**COMMERCE, U.S. Department of.** A Department of the U.S. Government, created in 1903 as the Department of Commerce and Labor. The activities of the Department include population, agricultural and other censuses; collection, analysis, and dissemination of commercial statistics; promotion of foreign and domestic commerce; coastal and geodetic surveys; establishment of commodity weights, measures, and standards; supervision of the issuance of patents and the registration of trade-marks; the establishment and maintenance of aids to air navigation, the certification of airmen, the inspection and registration of aircraft, and the enforcement of rules and regulations issued pursuant to the Civil Aeronautics Act of 1938; supervision of the issuance of weather forecasts and warnings for the benefit of agriculture, commerce, and navigation including weather service for aviation, and the

publication of climatic statistics; development of inland waterway transportation; and supervision of the operation of government-owned barge lines, and numerous other functions concerning these activities and related subjects.

The Department of Commerce as at present constituted, with the Office of the Secretary, includes:

- Bureau of the Census
- Bureau of Foreign and Domestic Commerce
- Civil Aeronautics Administration
- Coast and Geodetic Survey
- Inland Waterways Corporation
- Office of Small Business
- Office of Business Economics
- Office of Field Operations
- Office of Domestic Commerce
- Office of International Trade
- Patent Office
- National Bureau of Standards
- Weather Bureau

Secretary in 1946: W. Averell Harriman; Under Secretary, William C. Foster.

**COMMODITY CREDIT CORPORATION (CCC).** An agency under the War Food Administration of the U.S. Department of Agriculture, established as an independent agency in 1933, transferred to the War Food Administration, Apr. 19, 1943, and later, June 29, 1945, placed again under the control of the Department of Agriculture. It has an authorized capital of \$100,000,000.

The Corporation is empowered under its charter to buy and sell, lend upon, or otherwise deal in agricultural or other commodities. To finance these activities, it is permitted, under the act of Apr. 12, 1945, to borrow by the issuance of obligations guaranteed by the U.S. and not to exceed \$4,750,000,000.

Prior to the outbreak of World War II the Corporation was engaged principally in making loans to farmers on agricultural commodities stored on farms and in warehouses. Objectives were to help stabilize the prices of farm products, bring about the orderly marketing of farm products, and to accumulate supplies during years of abundance for use in years of shortage. Following the outbreak of war, operations were expanded to help increase the production of food, feed, and fibers for war needs. To this end numerous loan, purchase, and sales programs are now in operation. Commodities include practically all the food and feed grains, vegetable-oil crops, some truck crops, cotton, hemp, and naval stores.

The Corporation buys, stores, and ships agricultural commodities and foods for the United Nations Relief and Rehabilitation Administration and cash-paying foreign governments; helps to finance the domestic production of commodities formerly imported; and disposes of surplus food and of farm commodities for export at competitive world prices, pursuant to the Surplus Property Act of 1944. President in 1946: Jesse B. Gilmer (acting).

**COMMONWEALTH FUND, The.** This endowment, established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind," and later increased by gifts from the founder and from Edward S. Harkness, President of the Fund from its inception until his death January 29, 1940, now amounts to approximately \$50,237,489. Appropriations in the year ended September 30, 1946, were \$2,121,917.69. Activities tending to promote or maintain physical and mental health accounted for more than 85 percent of this total. More than \$400,000 was appropriated for medical research. A pilot course in psychotherapy for general physicians given at the Center for Continuation Study at the

University of Minnesota highlighted the year's work in medical education. Fellowships were offered as usual for advanced medical study; provision was made for visiting instructors in medical schools; aid was given to departments of preventive medicine and psychiatry, and to clinical and teaching services designed to encourage comprehensive medicine. Public health activities designed to raise standards of rural service centered in Mississippi, Oklahoma, and Tennessee, and professional training for public health was fostered in Louisiana and Florida. In the rural hospital program emphasis was thrown on the regional linking of small hospitals with medical centers as a means of raising the level of rural medical care. An experimental project for this purpose was set up in the area surrounding Rochester, New York, and the Medical College of Virginia was aided in extending educational services to surrounding hospitals. The Commonwealth Fund Fellowships for British graduate students at American universities, suspended during the war, were resumed with the appointment of 20 Fellows for the year 1946-47. The Fund published in the year nine books and two pamphlets of educational significance in its fields of operation. The Directors: Malcolm P. Aldrich (President), David P. Barr, William E. Birdsall, Phil W. Bunnell, Robert A. Lovett, Lewis Perry, Barry C. Smith, William E. Stevenson, and Thomas D. Thacher. Offices: 41 East 57th Street, New York 22, New York.

**COMMUNICATIONS, Electrical.** August 6, 1946 was the 20th anniversary of the first successful commercial presentation of motion pictures with associated sound effects. That event climaxed a quarter-century of experimental effort to join sight and sound in the motion picture, an effort that was finally brought to successful conclusion through the development of electronic and electromagnetic equipment which obviated the insuperable difficulties entailed with the direct mechanical recording of sound as was represented in the phonograph prior to its "electrification." The first successful sound-motion-picture showing were "shorts," principally musical numbers. In 1927, Al Jolson, in "The Jazz Singer," introduced singing and speech for the first time in a full-length motion-picture feature, the public success of which caused essentially the entire motion-picture industry immediately to turn to the production of sound pictures. The development of sound equipment, both recording and reproduction, was the direct result of the continuing research of the telephone industry. The talking motion picture as it is known today did not come into being all at once. First there were mere "sound pictures" with only musical accompaniment; then, "talking pictures" like the "Jazz Singer;" later, so-called "all talking pictures;" finally "100 percent all-talking-pictures." Earlier sound pictures were produced by synchronizing motion-picture machines and special phonograph reproducing equipment; modern sound pictures contain the sound-track photographically reproduced right on the motion-picture film.

By action of the National Bureau of Standards of the Department of Commerce, the entire microwave range up to 33,000 megacycles per second now is covered by official frequency standards. This brings a degree of order out of the mushroom-like wartime developments which are now revolutionizing the whole radio field. The new frequency range is about 30,000 times greater than the present broadcast band of frequencies. The new frequency standards for the microwave range have an

accuracy of one part in ten million; in the ultra-high frequency and super-high frequency band, this accuracy is better than one part in a hundred million. These fixed frequencies cover the two bands at intervals of approximately one percent, which is the normal separation between stations operating in the conventional broadcast range. The number of new channels thus is enormous, and the high degree of precision in the separation makes available the largest possible number of usable channels and reduces interference to a minimum. Generally speaking, microwaves extend from 10 centimeters down; the Bureau of Standards now is working on the millimeter region. For the purposes of classification and allocation, microwaves are divided into four bands with the following nomenclatures:

Designation	Symbol	Megacycles	Wave Length in Centimeters
High.....	HF	3-30	10,000-1,000
Very High.....	VHF	30-300	1,000-100
Ultra-High.....	UHF	300-3,000	100-10
Super-High.....	SHF	3,000-30,000	10-1

Late in the year, the International Standard Electric Corporation announced that it will distribute in countries outside of the United States the telephoto facsimile equipment manufactured by Times Telephoto Equipment, Inc., a subsidiary of the New York Times Company. This equipment, originally developed for the transmission of news photographs, was widely used for many purposes in the wartime communications services of the armed forces and of the Office of War Information. Until recently, the entire output of such equipment has been applied to the needs of the government and the Associated Press. Now that equipment is being produced in larger quantities than required by these agencies, it will be made available to others throughout the world.

**Radio.** The year 1946 came to a close with approximately 100 FM stations in operation or under construction, and applications for some 900 others had been, or were being, processed by the Federal Communications Commission. The production of equipment for FM transmitter stations had reached a substantial level and was rapidly growing. According to industry reports, at least 90 percent of the better console models of radio broadcast receivers and 20 percent or more of all receiving sets produced in 1947 are expected to be fitted for FM reception. One factor that served to retard FM development in 1946, according to industry reports, was the demand made by James C. Petrillo, head of the American Federation of Musicians, for double fees where a program was to be broadcast over both FM and standard stations.

In general, with its record 1946 production of 15,000,000 receiving sets, the radio industry provided one outstanding example of American industrial accomplishment in transition from wartime to peacetime production.

Early in the year, radio broadcasting suffered some setback as the result of a rather general shifting and cancellation of programs. However, the situation had become stabilized again by the latter part of the year. The American Broadcasting Company was regarded as having scored the coup of the year by winning the Philco-sponsored Bing Crosby show, and also caused some furore and speculation in the industry as to the status and future of "live" shows by handling the Crosby show through the medium of recordings.

Voluminous criticisms of radio programs in general reached something of a peak in the so-called

"Blue Book" issued by the FCC under the chairmanship of Paul A. Porter, who later was chief of the Office of Price Administration. The FCC Blue Book sharply criticized the broadcasting industry for excessive commercialization and called for more public-service programs. Although the National Association of Broadcasters strongly resented the FCC charges, and complained that the Commission was overstepping its regulatory functions and undertaking to censor radio programs, two of the largest networks—Columbia Broadcasting System and National Broadcasting Company—decided that something constructive could be done about it, and instituted a radio discussion period "Time for Reason—About Radio" for the purpose of exploring public sentiment.

When a broadcasting station applies for a three-year license, the FCC requires the applicant to promise to originate a satisfactory number of educational and other public-service programs. The Commission made it very clear in 1946 that stations applying for license renewal will have their records examined thoroughly to determine the extent of fulfillment of this pledge. The Commission has said that if the station's performance is unsatisfactory, no licenses will be renewed. So far, no station has been denied license renewal, although as the year closed a test case in the courts was in the making and undoubtedly destined to go to the Supreme Court unless Congress should intervene.

In November, the call letters of the New York key station of the National Broadcasting System were changed from WEAf to WNBC. Similarly, the call letters of the New York key station of the Columbia Broadcasting System were changed from WABC to WCBS. The change in the WEAf call letters is reminiscent of a bit of pertinent history. In October 1919, the Bell Telephone Laboratories, Inc., in New York City, were authorized to establish a 100-watt transmitting station the call letters of which were 2XB. Later the power was raised to a 500-watt output, and in June 1922, the station received a broadcast license with call letters WEAf. The station was atop the Bell Laboratories building on West Street in lower New York City and served as a valuable proving ground in the telephone company's study of radio technique and equipment. Credit also is claimed by WEAf for pioneering the American method of supporting the expense of radio broadcasting service by the sale of time to advertisers. In 1926, the telephone company sold WEAf to the National Broadcasting Company, which subsequently moved the station to Bellmore, New York.

Typical of innovations in radio-receiving equipment are the following: A new self-charging portable radio designed to operate for 20 hours on one cent's worth of electricity, through the medium of a small 2-volt "leak-proof" storage battery which is recharged automatically whenever the set is plugged into alternating current house supply. To replace the hitherto common filament-type rectifier tubes, tiny selenium rectifier units are coming into use; these were used by the millions in proximity-fuze bombs during the war. A coin-operated receiving set for hotel-room use supplies two hours of reception upon insertion of a 25-cent coin. A table model combination electric clock and radio takes the place of an alarm clock, awakening the sleeper by automatically turning on at a predetermined time a preselected radio station.

Multiplex radio broadcasting—the transmission of numerous radio programs at the same time over the same transmitter on a single radio-frequency channel—was demonstrated during September and

October to the FCC, chief communications officers of the U.S. armed forces, and others. The programs which were broadcast simultaneously included: (1) transmission of photographs and facsimile copy including weather maps; (2) the Dow Jones financial news ticker service; (3) conventional teletype transmission; (4) a news commentator; (5) a re-broadcast of a standard AM radio program; (6) re-broadcast of a standard FM radio program; (7) transmission of music such as ordinarily delivered in some large cities by wire from a central point to restaurants, hotels, clubs, etc.; (8) a program of recorded music. The multiplex broadcasting system demonstrated was based upon a previous development of multi-channel pulse-time-modulated microwave link. See 1946 YEAR BOOK.

**Radiotelephony.** The Bell System announced early in 1946 that rapid progress was being made in its postwar program to restore world wide radiotelephone connections, and to extend the scope of and improve the facilities for radiotelephone service so that from any telephone on its United States system a direct connection via radio would be possible with individual telephones in more than 80 overseas countries and territories. By early in the year, overseas service has been reestablished for public use between the United States and Great Britain, France, the Netherlands, Switzerland, Spain, Portugal, and Italy, also for government and press calls, with Russia. Service to several cities in the American zone of occupation in Germany enabled military personnel to communicate with relatives in the United States; similar service was established across the Pacific for the use of military personnel in Japan.

Public radiotelephone service also was reestablished with the Philippines and Australia, and newly established with New Zealand. Service to Hawaii was available all during the war, as it was with Central and South America and most Caribbean countries. Direct service was opened with Egypt; extended subsequently as conditions and equipment permitted to Norway, Belgium, Sweden, Denmark, and Iceland; progress was made also toward the reestablishment of trans-Pacific service to China and Java. Overseas traffic is many times higher than it was prewar, and rates in general are reported as being about 40 percent lower than prewar. A typical three-minute conversation between New York and most points in Europe, the Pacific area, and South America, was reported as costing \$12, with lower charges for the same call to Hawaii, the Caribbean area, Central America, and northern South America. During the first two months following the reestablishment of public radiotelephone service across the Atlantic in June 1945, the traffic was reported as equalling the volume for the entire first eight months of the year 1939, the last normal prewar period reported upon. The traffic has steadily grown.

Two new developments in communication facilities of great potential significance to the aviation industry were demonstrated at the Indianapolis Municipal Airport in October during the convening there of aviation experts from 38 nations who were gathered to study United States methods of air navigation. One of these new equipments was an experimental model of a flying radioteletype. The other demonstration was a trial of telephone communication between an airplane in flight and a ground telephone station served by the ground telephone communication network. Both local and long-distance telephone calls were established each way between the ground and two airplanes of the Civil Aeronautics Administration which were in

flight over Indianapolis. These involved a combination of wire and radio transmission. Similarly, in the flying teletype test, direct teletype messages concerning weather reports and other desired data were sent from teletypewriters on the ground to the airplanes in flight, and also from the planes to the ground.

Service between the United States and the Virgin Islands was inaugurated on October 15, providing not only the first direct radiotelephone connection between the United States and St. Thomas, but providing also for the first time direct service between the neighboring islands of St. Thomas and Puerto Rico.

Indicative of the trend in maritime radiotelephone communication is the installation reported for the "Queen Elizabeth." Included in this installation are: simultaneous radiotelephone and radiotelegraph services with Great Britain and with the United States, and connections through either of these to any part of the world; self-powered emergency radio for individual lifeboats, radio direction-finders; a special radio for harbor communication, very useful in docking such large ships; a complete sound-distribution and amplification system throughout the ship which provides passengers with music, entertainment, news, and programs originating either on the ship or picked up by radio. Perhaps the most outstanding feature of the whole installation is the elaborate radiotelephone system whereby individual passengers may pick up their bedside telephones and call through New York or London to any country in the world where telephone service is connected to an international exchange; also, passengers may converse with passengers on other ships fitted with radiotelephones. In addition to such recently developed navigational aids as radar, the "Queen Elizabeth" is fitted with two separate direction-finders.

As of September 12, 1946, the FCC revised its rules and regulations to permit the widespread use of mobile radiotelephone service and equipment by public utilities companies in connection with system operation and maintenance. As reported in the 1946 YEAR BOOK, mobile radiotelephone service brings to drivers of appropriately equipped vehicles the advantages of two-way voice communication, either with predetermined central control points or through such points to any telephone on an established wire-line system. The following selected examples, among those reported for 1946 will show the trends and significant possibilities of this development:

As of November 6, the Northwestern Bell Telephone was authorized by FCC to operate 30 experimental radiotelephone mobile units in and around Des Moines, Iowa. The Commission described this as a part of a national program for exploring the mobile telephone service field for the purpose of developing basic information for future government regulations governing the licensing and operation of mobile radiotelephone equipment in the United States. In Portland, Oregon, an electric utility has installed an FM radio-station atop a nearby mountain to provide a medium for radiotelephone communication between its central office in Portland and its fleet of cars, trucks, and other vehicles associated with system construction, operation, and maintenance. In the Middle West, plans were reported by a large electrical manufacturing company to provide for two-way radiotelephone communication between a central dispatching office and a fleet of electric trucks operating throughout the extensive factory grounds. Incidental to a violent explosion and

fierce resulting fire in an aviation-gasoline plant near Philadelphia, which claimed the lives of nine persons and seriously burned 200 others, a radiotelephone-equipped truck belonging to the local telephone company served as an emergency communication center through which officials were able to summon additional aid as required, to direct rescue operations, and to handle calls to hospitals and physicians. In New York City, a handset telephone with an ordinary dial was used by the driver of an automobile to communicate with a station more than a mile away, and to choose selectively the station to which to direct his call. This was taken as the advance indication of a future possibility whereby drivers may dial into existing telephone lines for either local or long-distance calls, and through which a station may contact any car on the road if its general location is known.

An enormous expansion of two-way radiotelephone communication in railroad service was indicated in an FCC prediction of January 1946 that by July 1947 there would be 3,000 U.S. railroad stations equipped for two-way communication with moving trains and other points. Permits for experimental installations numbered only 145 as of July 1, 1945, exceeded 2,000 by mid-1946, and were expected to reach 3,300 by mid-1947. In addition to the 3,300 railroad-station radiotelephone installations, the FCC expects that an additional 1,800 such installations will be made by other companies by July 1947. Experimental work is continuing in the effort to develop radio-communications equipment which can be used effectively inside of railroad and other tunnels.

**Telephony.** At the beginning of 1946, the first peacetime year since 1941, some 54 percent of the world's 51.5 million telephones, or 28 million were installed in the United States. During the four war years, in spite of critical shortages of material and labor, the number of U.S. telephones increased about 19 percent, but left an unsatisfied demand of approximately 10 percent or 2.5 million telephones represented in backlog service orders at the beginning of the year. During the first ten months of 1946 the total number of telephones in service in the United States passed the 30-million mark, some 25.2 million on the Bell System and five million among the 6,000 independent telephone companies in the United States. In spite of this, it was expected that a backlog of more than two million telephone-service applications would be carried over from 1946 to 1947.

Statistical information pertaining to the quantity and distribution of the world's telephones are given in the accompanying table. These data reflect the world's telephone situation as of January 1, 1946, to the limit of available information. An interesting comparison is revealed by the figures. In the United States, where the telephone industry is a free private enterprise operating under government regulation, there are 21 telephones for each 100 population compared with an average development of 2.2 telephones per 100 population for the entire world. Compared with this, Australia, Great Britain, France, Russia, and Sweden together had only three telephones per 100 population, although they account for some 12 percent of the world's population as compared with the United States' 6 percent. Yet these countries reported the five largest telephone systems owned and operated by national governments. New York with 2,002,310, and Chicago with 1,204,525, still are reported as the two largest urban telephone centers in the world. In spite of such concentration, however, no single city

in the United States has as many as 8 percent of the total number of U.S. telephones. In comparison with this, the capital cities of Belgium, Denmark, and France each contained approximately a third of the total number of telephones in those countries; more than 29 percent of Norway's telephones are in Oslo, alone, and more than 25 percent of Sweden's telephones are in the Stockholm area. San Francisco still leads the world in telephone density, with 43.3 telephones for each 100

inhabitants; among large foreign cities, only Stockholm with 38.4 telephones per 100 population even approaches San Francisco's record.

Two telephone developments of particular significance to sparsely settled areas were extended in 1946. One of these was a system for providing telephone service over electric power distribution lines. The other was the more-or-less experimental development of radiotelephone service for farms and ranches remote even from electric power lines.

### TELEPHONE STATISTICS OF THE WORLD

Latest Available Data (Sept. 1, 1946)

Notes: The above statistics as published by American Tel. & Tel. Co. incorporate the most recent information available on August 31, 1946. Totals for the world and geographical areas are partly estimated.

\* The telephone development (telephone expressed in thousands) of other representative cities in the United States was, on January 1, 1946:

Chicago, Ill.....	1,204.5	telephones, or 34.5 per 100 population	Milwaukee, Wis.....	215.6	telephones, or 27.2 per 100 population
Los Angeles, Cal.....	591.0	" " " " " "	Minneapolis, Minn.....	198.2	" " " " " "
Cleveland, Ohio.....	575.0	" " " " " "	Seattle, Wash.....	190.3	" " " " " "
Washington, D.C.....	364.4	" " " " " "	Denver, Col.....	134.7	" " " " " "
San Francisco, Cal.....	344.0	" " " " " "	Hartford, Conn.....	90.8	" " " " " "
Boston, Mass.....	232.0	" " " " " "	Omaha, Neb.....	84.3	" " " " " "

Both these developments seem to be destined to establish themselves as important elements in the nation's evergrowing voice communication systems.

The transcontinental coaxial-cable telephone-line project of the Bell System was further extended during 1946, approximately 3,000 miles of it having been laid in the ground by the end of the year, with an additional 3,000 miles scheduled for 1947. A single pair of coaxial-cable units can accommodate 480 telephone circuits, and the coaxial cables being laid include up to four such pairs. The cables will accommodate television broadcast distribution as well as ordinary long-distance telephone service.

Another rapidly developing and potentially significant type of facility in the U.S. long distance telephone network is the ultra-high frequency "microwave" or "microray," wartime radio-relay system. The Bell System's experimental radio-relay system currently being installed between Boston and New York was expected to be available for experimental operation by the spring of 1947.

Reviving an old complaint, the telephone industry of the United States filed briefs with the FCC emphasizing the "right of privacy" in telephone service as against the use of recording devices in connection with telephones; further, urged the Commission to promulgate the principles that would be helpful in controlling and solving recorder problem in connection with telephone service. Recorders for telephone conversations were used rather extensively during the war incidental to military operations, but many persons regard the use of such equipment in ordinary peacetime commercial telephone service as being closely akin to wire-tapping.

One of the largest international business operations in recent years and probably the largest financial transaction in the history of international communications was consummated September 28, 1946, when the Argentine Congress ratified purchase by the Argentine Government of the United River Plate Telephone Co. Ltd. from the International Telephone and Telegraph Co. The reported price was \$94,991,364.42 plus the assumption by the Argentine Government of the Company's debentures outstanding in the Argentine, Swiss, and Swedish markets. I.T.&T. will continue for ten years as technical adviser in the operation of the system.

**Telegraphy.** As reported in the 1946 YEAR BOOK, the Western Union Telegraph Company, based upon successful experimentation under commercial traffic conditions, has begun the construction of a super-high-frequency radio-relay system utilizing wartime developments which ultimately may supersede entirely the conventional wire systems for heavy-traffic telegraph circuits. The first step in this program was the expansion of the experimental radiotelegraph-relay link between New York and Philadelphia into a triangular radio-relay link interconnecting New York, Washington, and Pittsburgh. This work was reported to be well under way at the close of 1946, and scheduled for completion in 1947.

International developments in telegraph communication included the establishment of direct high-speed radiotelegraph service between New York and Rome, and the establishment of facilities for transmitting facsimile and telephoto subjects to various foreign countries.

**Television.** Potentialities of television continued to excite a good many persons, but very little was actually accomplished in the placement of television programs in the American home. Few com-

panies were making any receiving sets at all, and these only in limited quantities. As compared with an industry objective of some 15-million radio-receiving sets for 1947, the expectancy was for less than a half-million television sets for 1947. Most of the 1946 television publicity had to do with claims, pro and con, on the question as to whether the involved technical developments had yet advanced sufficiently to make color television logical. Chief advocate of immediate color was the Columbia Broadcasting System which made repeated public demonstrations and tests of its mechanical-disc system. Chief antagonist of immediate color was Radio Corporation of America whose engineers seemed to be thoroughly convinced that practical color television was not yet ready for general use, and that it should be accomplished by electronic means rather than mechanical means before it is released. R.C.A., too, made demonstrations in support of its contention.

Early in December, CBS made representations to the Federal Communications Commission calling for the establishment of commercial standards for color television. This action seemed very likely to bring the color controversy to a head. Emphasizing its determination to promote immediate color television, CBS was proceeding with its installations of a one-kilowatt-output television broadcasting equipment on the 71st floor of the Chrysler Building in New York City, to operate on a carrier frequency of 490 megacycles assigned by FCC. For faithful reproduction of the original subject the image transmission will record all frequencies between 20 cycles and 10 megacycles per second. The one-kilowatt power output is the high power reliably available with existing equipment and technique. With appropriate directive antenna, CBS engineers considered that the power available would be adequate for satisfactory coverage of the New York metropolitan and suburban areas, based upon preliminary tests.

Available year-end statistics indicated a total of only approximately 8,000 television receiving sets currently in service in the United States, approximately 5,000 of them in the New York metropolitan area. New television home receivers were being advertised at prices ranging from \$225 to \$2,800. The lower prices covered table models providing a viewing screen approximately 4 x 5 inches in size, together with television sound reception, but no standard broadcast reception. The top-priced sets included viewing screens up to approximately 20 x 30 inches in size, the increase being accomplished by a system of lenses and mirrors, and included a full variety of radio-broadcast and phonograph equipment. These receivers for black-and-white reception only, were producing results definitely superior to the reception quality of prewar sets.

Television programs are in the stage of somewhat uncertain development. The bulk of current "telecasts" represents direct pick-ups of baseball games, football games, and other sporting events, although studio shows, including those of an audience-participation nature, and motion pictures are being used. Experiments in theatre use of television equipment were being conducted on a full-scale basis in New York City. Some observers were predicting that television would be sufficiently extensive by 1948 to exert material influence on that year's political campaign.

For the inter-city exchange transmission of television programs, the only facility available by the year-end was the American Telephone and Telegraph Company's coaxial-cable system between

New York, Philadelphia, and Washington, and an overland radio-relay installation near Schenectady, N.Y., capable of direct pickup of television programs from the Empire State Building in New York City approximately 150 miles distant. The experimental radio-relay communication channel being established by the Bell System between New York and Boston also may be effective in the inter-city exchange of television programs.

In spite of promotional demonstrations of facsimile radio transmission and receiving equipment, practical progress left little of significance to report at the end of the year.

The application of television and radar equipment to the navigational needs of commercial aviation continued to be the subject of extensive and intensive laboratory and field investigation during 1946. Military radar equipment developed during the war, as effective as it was, has proved to be entirely too expensive for practical commercial application. The trend in developments seems to indicate, however, that both the cost of such equipment, and the weight of the airborne equipment, soon may be brought to a range within practical commercial possibilities. For the special purpose of assisting aircraft to land at airports under conditions of zero visibility, a combination of television and radar equipment and procedure showed great promise.

For quite some time the military services had demonstrated the success of what has been called a "ground-control approach" (GCA) system which, when operated on the ground at the airport, could locate a nearby approaching plane on radar viewers and the operator, by using radiotelephone to give direct instructions to an incoming pilot, literally could "talk" the pilot right down onto the runway. Under this system, of course, the pilot is flying entirely blind and must judge his actual location with respect to his desired runway entirely by means of the instructions received vocally from the crew on the ground. To this GCA equipment television now has been added to enable an incoming pilot literally to "see" a television-radar-equipped airport from anywhere within a radius of 30 miles or so of that port, thus enabling the pilot to determine his own position visually with reference not only to the airport, but to any other aircraft in the immediate area. The essential features of this equipment are a ground-search radar which surveys the air space adjacent to an airport and gives a visual picture of that space and its content on its cathode-ray-tube viewing screen; this radar "picture" then is picked up automatically by a television camera, combined visually with a superimposed map of the area, and the combination picture is broadcast by an ordinary television transmitter, the signals of which can be picked up by incoming aircraft. Different manufacturers have given this type of equipment such special names as "Teloran," "Navar," etc.

Extensive field experiments with the new combination television-radar equipment were proceeding apace at the year-end with considerable promise for 1947 and the future. The first routine application in North America to commercial airline operation of war-developed radar for aircraft landing, the GCA system alone, was in full operation at the transatlantic air terminal at Gander, Newfoundland.

Dr. Lee De Forest, famous for his development of the "Audion," early three-element vacuum tube, in a year-end statement said that 1947 "is certain to convince every skeptic, every scoffer, that television has arrived from around that fabled corner."

Dr. De Forest further expressed the opinion that coaxial cables would not be economical for television networks, but would give way to radio-relay connections between broadcasting stations, especially "when we deal with 1,000-line picture standards, whither the art is . . . definitely destined."

As of July 1, 1946, the FCC has authorized a total of 14 commercial television broadcasting stations in the U.S.:

1. KTSN—Don Lee Broadcasting System, Los Angeles, Calif.
2. WABD—Dumont Laboratories, New York, N.Y.
3. WBKB—Balaban & Katz Corp., Chicago, Ill.
4. WOBW—Columbia Broadcasting System, New York, N.Y.
5. WNBT—National Broadcasting Co., New York, N.Y.
6. WNBW—National Broadcasting Co., New York, N.Y.
7. WRGB—General Electric Co., Schenectady, N.Y.
8. WPTZ—Phileo Products, Inc., Philadelphia, Pa.
9. WTZR—Zenith Radio Corp., Chicago, Ill.
10. ———Bamberger Broadcasting Service, Washington, D.C.
11. ———Dumont Laboratories, Washington, D.C.
12. ———Evening Star, Washington, D.C.
13. ———National Broadcasting Co., Chicago, Ill.
14. ———National Broadcasting Co., Cleveland, O.

Some 15 other applications for construction permits for commercial stations were pending, and 30 experimental stations were operating or under construction.

G. ROSS HENNINGER.

**COMMUNISM.** Communist activities throughout the world have been greatly influenced in 1946, as always, by the domestic and especially by the foreign policies of the Soviet Union. This year the belligerence of the USSR in its foreign relations has been a matter of daily note. Whether this belligerence grows out of expansionist ambitions or results from Soviet suspicions of the United States and Great Britain, it is a fact of cardinal significance to every Communist.

In the USSR itself there have been noteworthy developments. To begin with, there has been a new emphasis on the revolutionary teachings of Marx and Lenin, which were seldom mentioned in the period of the anti-German alliance. Marshal Stalin gave the signal for this re-assertion of Marxist principles in his pre-election speech of February 9, 1946. Capitalism, he said, was responsible for both World War I and World War II, although he conceded that the latter had an anti-fascist and democratic character. The Soviet press, quick to follow Stalin's lead, has repeatedly attacked capitalism in the United States and Great Britain.

The purges that have taken place in Russia are also significant. Even if they are, as Walter Durrant suggests, merely the usual kind of periodic house cleaning, they show that Russia is preparing for any eventuality. The purges in the arts, moreover, are interesting because of the insistence on doing away with "alien"—i.e. western European and American—influences. The Soviet Union, it appears, is entering upon another period of isolationism. If one can judge from past experience, this is likely to result in increased dogmatism and inflexibility throughout the Communist movement.

However, just as the Soviet Union's utterances vary from the bellicose to the pacific, so Communist tactics in other countries are now revolutionary and now conciliatory. No decisive change has as yet taken place in the Communist line, but Communists are ready for such a change if circumstances make it necessary.

**Russia's Sphere of Influence.** As was pointed out in the article on Communism in the YEAR BOOK for 1945, the Soviet Union is determined to have only

friendly governments in neighboring countries, and its sphere of influence stretches from Finland in the north, through Poland, to the Balkans. Of the Balkan countries, only Greece lies outside the Russian zone. In Greece, where non-Communists are supported by British arms, 72 percent of the voters favored the restoration of the monarchy in a plebiscite held on September 1.

The Soviet Union obviously welcomes Communist or Communist-led governments in neighboring countries, since it can count on Communist loyalty, but it has shown its willingness to cooperate with politicians of almost any hue—so long as they are not hostile to Russia. Certain countries within the sphere of influence are completely under Communist domination; in others the Communists are still struggling for control; and in others a temporary balance of forces has been arrived at.

Yugoslavia, Bulgaria, and Albania are the countries in which Communist power is most firmly established. In Albania, 95 percent of the voters favored the National Front government of Enver Hoxha, which not only is sympathetic to the USSR but appears to be introducing Soviet institutions. In Bulgaria an election was held on October 27, despite protests from the United States, and 77 percent of the votes favored the five-party Fatherland Front, which is dominated by the Communists. Georgi Dimitrov, Communist leader, warned voters not to oppose the Front, reminding them of the fate of General Mikhailovitch. In Yugoslavia Marshal Tito and his Communist associates have strengthened their power since their victory in the election of November 11, 1945, and the trial and execution of Mikhailovitch demonstrated the dangers of opposition. It is said that from 70 to 90 percent of Yugoslavia's large industry has been nationalized.

In other countries in the Russian sphere of influence the degree of Communist control varies. In Rumania, for instance, the Communists dominate the government, but they have almost no popular following. In its replies to various American protests, the Democratic Front government of Petru Groza has made it clear that it would not permit the opposition to take office. The election of November 19, in which the Democratic Front won two-thirds of the votes, was denounced by both the United States and Great Britain as undemocratic.

In Poland a somewhat similar situation exists, for there is powerful opposition to the government of President Boleslaw Bierut and his Left Wing bloc, and Stanislaw Mikolajczyk, leader of the Peasant Party, is a popular figure. Polish Communists have sought to strengthen their control, both by suppression of the opposition, and by the introduction of measures likely to win mass support. For example, the large estates have not been collectivized but have been broken up and distributed among the peasants. In a referendum held on June 30, the Left Wing carried its proposal for a unicameral legislature, winning 60 percent of the votes. After repeated postponements, an election was held on January 19, 1947, and resulted in the expected Left Wing victory.

In Finland and Czechoslovakia, non-Communist groups have for the most part reconciled themselves to Soviet domination. In Finland this acquiescence is a matter of bitter necessity, and in domestic affairs the Communists have lost ground in 1946. In Czechoslovakia, on the other hand, the relationship between Communists and non-Communists appears to be peaceful. The Communists emerged as the strongest single party in the election of May 26, and although they and their allies

won a bare majority in parliament, they dominate the government. Prime Minister Klement Gottwald, a Communist, has been pushing an extensive program of nationalization. The opposition press, however, remains outspoken, and observers say there is a considerable degree of democracy.

Austria and Hungary have been treated by the USSR as conquered countries, and in both nations the Communists are unpopular. In elections held in November, 1945, the Hungarian Communist Party won only 54 parliamentary seats, and the Austrian Communists only four. Communists nevertheless hold important positions in the cabinets of both countries.

In Germany interest has centered in events in the Russian zone of occupation. In February the Communists began an attempt to merge the Communist Party and the Social Democratic Party. On March 1, a Social Democratic convention rejected the merger, and later in the month a vote of the membership supported this position. Otto Grotewohl, party chairman, and other Social Democratic Party leaders who favored the merger were removed from office, and the Grotewohl faction then joined the Communists in forming the Socialist Union Party. Members of this group argued that the Social Democratic Party had passed out of existence and should not be put on the ballot, but the Allied Control Commission recognized both the Social Democratic Party and the Socialist Union Party. In local elections, held in the first part of September, the Socialist Union Party won majorities in most cities of the Russian zone, but was less successful than had been predicted. In elections for the state assembly on October 20, the Union Party made an even poorer showing, and in Berlin, to the surprise of most observers, it received only 20 percent of the vote, with nearly 50 percent going to the Social Democrats. In various local elections in the American, British, and French zones the Communists have been a poor third, the great majority of the votes being divided between the Social Democrats and the Christian Democrats.

**Western Europe.** The Communist defeat in Berlin seemed to some students to indicate a decline of Communist influence. In most countries, however, it would appear that the Communists have at least held their own in 1946. They have made gains in Holland and Belgium, and in the latter country the Socialists cannot hold power without their support. In the French elections of June 2, the Communists dropped to second place, but in the elections of November 10 they once more emerged as the largest party in the Constituent Assembly. Their gains were made largely at the expense of the Socialists, who had refused to enter into a merger or close alliance.

In Italy the Communists were a relatively weak third in the elections of June 2 and 3, but Alcide de Gasperi, Christian Democratic leader, found it necessary to give them four places in his cabinet. The Communists have officially supported de Gasperi, but at the same time have criticized his policies. On October 27 they succeeded in forming a closer alliance with the Socialists, and the two parties made a strong showing in the municipal elections of November 11. The Trieste problem has been difficult for Italian Communists because of the Soviet Union's interest in that city. They have urged direct negotiations between Italy and Yugoslavia, and in November Palmiro Togliatti, Communist leader, announced that Marshal Tito was willing to confer with Italy.

In England the Communists have never been strong, and they made no gains in 1946. Their ap-

plication for affiliation with the Labor Party was rejected by a six-to-one vote. In local elections on November 1, only one out of 223 Communist candidates was elected.

**United States.** On February 13, 1946, Earl Browder, for many years general secretary of the Communist Party and president of the Communist Political Association during the brief period of its existence, was expelled from the party by the unanimous vote of the national committee. This appeared to end an incident that had begun in May, 1945, when Jacques Duclos, a leading French Communist, attacked Browder and his policies. Two months after Browder's expulsion, however, it was announced that he was flying to the Soviet Union. The fact that he had obtained a Russian visa was taken to prove that he could not be persona non grata in Moscow, and a few weeks after his arrival he revealed to correspondents that he had been chosen to represent Soviet publishers in the United States. Officials of the party continued to attack Browder, but it was obvious that his successful visit to Russia caused them embarrassment. After his return, Browder refrained from comments on the Communist Party of the United States, but in interviews and in a series of articles published in the *New Republic* he defended Soviet domestic and foreign policies as enthusiastically as he had ever done in his days of party leadership.

After Browder's overthrow, the Communist Party was committed to a more militant policy, but it has been cautious in the development of its new line. William Z. Foster, party chairman, has repeatedly referred to Truman's surrender to Wall Street, but the party has made a distinction between progressive and reactionary Democrats, and in the November elections the Communists supported many Democratic candidates. Ruth McKenney, author of *My Sister Eileen*, and her husband, Bruce Minton, a former editor of the *New Masses*, were charged with "Left sectarianism" because they maintained that the party had not gone far enough in repudiating Browderism, and they and others were expelled. It was between this "Left sectarianism" and the "Right opportunism" of Browder that the party steered its course during 1946.

Rather because of growing distrust of the Soviet Union than because of the party's new line, many labor unions took steps to curb Communist activities in their ranks, and there were struggles between Communist and anti-Communist factions in such important CIO unions as the National Maritime Union and the United Electrical and Radio Workers.

**Latin America.** Communist strength appears to be growing in several South American countries. In Brazil the Communists won more than 600,000 votes in the election of December 2, 1945, and Luis Carlos Prestes, Communist leader, has maintained a steady agitation. In Venezuela, Bolivia, and Peru, though their numbers are not great, the Communists have considerable influence. It is in Chile, however, that they have made the most striking showing, for the newly elected president, Gonzalez Videla, has acknowledged the importance of the party's support by giving cabinet seats to three of its members.

Since the end of the war, the Communist press throughout Latin America has revived talk of Yankee imperialism, and has done its best to create a public opinion hostile to the United States. Some embarrassment was caused by the fact that the Peron government in Argentina, which had ruthlessly suppressed Argentinian Communists and had been denounced by Communists everywhere as a

fascist regime, resumed diplomatic relations with the Soviet Union on June 6, 1946, and was hailed by the Moscow press.

**China.** The situation in China, where Communist and anti-Communist forces are well matched, and where Russian and American interests clash, has remained critical and confused. At the end of 1945 a truce between the Kuomintang and the Communists appeared possible, and it seemed that their differences might be settled, at least in part, by parliamentary rather than military means. Negotiations were carried on intermittently throughout 1946, but at the same time there were military campaigns of considerable dimensions. The Communists demand a full coalition, with Communists in responsible positions, until an election is held. If negotiations finally break down, they have intimated, they will establish an autonomous state in North China and Manchuria. Chinese Communists have repeatedly criticized the United States for aiding Chiang Kai-shek's armies and for establishing military bases in China.

**Elsewhere in Asia.** Communists have created difficulties in Korea, which is divided into two zones, the northern being occupied by Russia and the southern by the United States. The Communists are strong in the northern zone, and it has been repeatedly charged that they aid their comrades in the south, who have opposed American occupation authorities. In Japan itself, on the other hand, the Communists have been much weaker than had been predicted. In the colonial countries the Communists are active, and occasionally they secure strategic positions, as in the new Indo-Chinese republic of Viet Nam, which has a Communist as its president. In the Philippines Communists have been articulate but apparently not influential.

GRANVILLE HICKS.

**COMMUNITY CHESTS AND COUNCILS, Inc.** The national membership association of Community Chests and Councils of Social Agencies, organized in February, 1918, as a national clearing house of ideas and service for Community Chests and Councils of Social Agencies. For description see *YEAR BOOK* for 1939. Of the 1,182 Chests and Councils in operation in August 1946 (852 Chests and 330 Councils), 811 Chests and 308 Councils were in continental United States; 4 Chests and 2 Councils in Hawaii; 34 Chests and 19 Councils in Canada; 2 Chests in South Africa; 1 Chest in the Virgin Islands; and 1 Council in the British West Indies. Almost every city in the United States (except New York City, which has a limited joint financing organization), in 1945 had a Community Chest or similar plan of federated financing for its voluntary social services. In 852 cities in 1945, more than twenty million contributions totaling \$197,048,839 were given to Community Chests to be used during 1946 for voluntary social work in their communities and for National War Fund agencies. In 1946, following the liquidation of the National War Fund, the Chest campaigns were united under the name "The Community Chests of America," using the national symbol of the Red Feather and the slogan, "Everybody Benefits—Everybody Gives."

Officers of the association for 1946 are: Honorary President: Gerard Swope. President: E. A. Roberts. Vice Presidents: J. B. Adoue, Jr., H. L. R. Emmet, Philip M. Morgan and Mrs. Henry P. Russell. Treasurer: Milton H. Glover. Secretary: Robert P. Lane. Executive Director: Ralph H. Blanchard. Address: 155 East 44 Street, New York 17, New York.

**COMMUNITY TRUSTS.** The aggregate charitable resources of 75 community trusts and foundations had risen to \$75,092,009, at the beginning of 1946, from \$67,041,684 a year before. The New York Community Trust administers 70 funds totaling \$17,090,046. Resources of \$12,274,073 were reported by the Chicago Community Trust; \$9,607,644 by the Cleveland Foundation; \$5,994,791 by the Boston Permanent Charity Fund; and \$4,194,669 by the California Community Foundation.

Philanthropic distribution from these funds rose to \$2,021,890 in 1945 from \$1,918,475 in the preceding year. The largest out-payments were those in New York, \$567,349; Chicago, \$351,211; Cleveland, \$253,929; Boston, \$250,715; and Hartford, \$114,742.

Additional gifts to community foundations in 1945 totaled \$5,342,010. The largest receipts were in Cleveland, \$1,030,510; Hartford, \$848,016; Chicago, \$776,000; and Kalamazoo, \$586,650.

In Mount Vernon, Ohio; Wilmington, North Carolina; and Rochester, Minnesota, new community trusts were established in 1945. These are composite foundations, created for the flexible administration of multiple charitable funds so that remedial action is facilitated if originally designated purposes become obsolete, impossible, or impracticable of execution.

The heads of the New York Community Trust, 120 Broadway, New York 5, New York, are: Winthrop W. Aldrich, Chairman Trustees' Committee; Thomas M. Debevoise, Chairman Distribution Committee; and Ralph Hayes, Director.

**COMPTROLLER OF THE CURRENCY,** Bureau of the. A Bureau of the U.S. Department of the Treasury which has general supervision over national banks; established 1863. Comptroller: Preston Delano.

**CONCILIATION SERVICE, U.S.** The function of the Conciliation Service, in the U.S. Department of Labor, is the settlement of labor management disputes through voluntary methods of conciliation, arbitration, and technical surveys. The Service handles strikes, lockouts, threatened strikes, and all types of controversies arising between employers and employees. With the termination of the War Labor Board and the labor relations divisions of the military and war agencies, the Conciliation Service is the only Federal agency, aside from those operating under the Railway Labor Act, responsible for maintenance of industrial peace throughout the country.

In addition to the seven regional offices located in Boston, New York, Atlanta, Cleveland, Chicago, Kansas City, and San Francisco, the Service maintains 23 branch and field offices located in other important industrial and commercial centers of the country. The Service now has a staff of more than 200 Commissioners of Conciliation chosen for their knowledge and experience in the field of labor-management relations. Any representative of labor, management, or the public can secure the services of a Commissioner of Conciliation by writing, wiring, or telephoning the Regional Director in the region in which the dispute occurs or by contacting the Washington office.

In an effort to obtain participation of labor and management groups, advisory committees, composed of an equal number of management and union representatives, have been established in a number of areas of the Service's activity. A national Labor-Management Advisory Committee was set up upon the recommendation of the President's Labor-Management Conference of November 1945

to counsel the Director of the Service on policy matters. Subsequently, labor-management advisory committees were established to advise the Technical Division and in each of the seven regions.

Arbitrators are appointed by the Service in cases where both the company and the employees agree to be bound by the decision rendered. The typical arbitration case is a dispute which the grievance machinery of the collective bargaining contract failed to resolve. Occasionally, also, arbitrators are requested by the parties to settle disputes arising during contract negotiations. Arbitrators are appointed by the Service on a per diem basis from lists approved by the regional Labor Management Advisory Committees. Except in unusual hardship cases the parties themselves pay the arbitrator's fees within an approved range. A study made in October 1946 indicates that the Conciliation Service leads all agencies, governmental and private, in the number of arbitrators appointed.

The Technical Division of the Service maintains a staff of 15 Technical Commissioners skilled in job and wage analysis. On the request of both parties to a dispute, a Technical Commissioner makes findings of fact in disputes involving incentive plans, merit rating plans, and intraplant inequities. Their findings are advisory in nature and not binding upon the parties.

The Program Division set up in early 1946 to carry out suggestions made by the President's Labor-Management Conference provides a variety of services to the operating divisions. Current Problems Conferences for Commissioners are held periodically in the field and in Washington, a variety of informational services are supplied, and the operating statistics of the Service are compiled and analyzed.

The Conciliation Service is currently called into about three-fourths of the strikes and lockouts in the country. Commissioners are particularly effective when they are called into a case before the dispute has reached the stage of a strike or lockout. Ninety percent of the threatened strike cases handled by Commissioners have been successfully settled without a work stoppage. From July 1, 1945 through June 30, 1946, the Service disposed of 18,840 cases including 8,294 strikes and threatened strikes involving over 5,000,000 workers. The facilities of the Service were used in all economic fields except those subject to the Railway Labor Act and were utilized by employees and employers in 48 states, the District of Columbia, Alaska, Puerto Rico, Hawaii, and the Virgin Islands.

• EDGAR L. WARREN.

**CONGREGATIONAL CHRISTIAN CHURCHES.** The Congregational Churches date their beginning in America with the first settlement at Plymouth, Massachusetts, in 1620. Later the Mayflower Pilgrims merged with the later coming Puritans to form the Congregational Churches. In 1931 these churches merged with the Christian Church founded before the Revolutionary War to form the present denomination.

The denomination from earliest days has preached and taught democratic ideals and has sought to support and to extend these ideals in the common life. It has fostered schools, colleges, social agencies and the democratic way in both church and state.

The denomination includes 5,836 self-governing churches, linked together by voluntary ties of fellowship in common endeavor. In addition, there are 678 missionary churches of this fellowship in foreign lands. The membership of the churches in

the United States is 1,130,824 with 121,200 members of the mission churches, a total of 1,252,024. The roll of ministers includes 5,882 ordained persons of whom 3,111 are pastors, denominational officials 120, missionaries 101, educators 263, chaplains 433. The benevolent giving was \$3,951,495, and the home expenses of the churches \$19,301,121. Total property was \$171,892,927, and the invested funds of the churches total \$31,225,155.

The American Board for Foreign Missions reports income of \$1,327,800 with investments of \$8,054,338; and the Board of Home Missions expenses of \$1,626,636; and investments of \$25,350,525. The Annuity Fund income was \$1,392,233 and investments were \$11,341,814. The total income of all the national agencies from all sources was \$6,232,247 and the investments were \$52,744,646.

The central office of the denomination is the General Council of Congregational Christian Churches, 287 Fourth Avenue, New York 10, New York.

**CONSTRUCTION INDUSTRY.** This great industry has sailed through rough and stormy seas during the early stages of the post-war period. It suffered from the general upset, from shortage of men and materials, from strikes and high prices, and from government restrictive orders. The expected steady increase in construction did not materialize, and planned programs and forecasts of progress were upset. Great expectations had been based on housing, to provide work for the construction industry and homes for the thousands of men coming out from the armed forces. There was much discussion and planning, but mass production of houses ready for occupancy was far below requirements.

From January, 1941, to June, 1946, construction wages increased 22 percent for skilled and 45 percent for common labor. The Bureau of Labor Statistics estimated the increase as 60 percent in the wages of skilled and common labor combined. But the 22 percent increase compares with 55 percent in manufacturing wages for skilled and semi-skilled labor, while the 45 percent compares with 61 percent for unskilled labor in manufacturing. Increase in prices of lumber and steel were 61 and 12 percent, respectively, while farm and industrial prices increased 96 percent. These trends in construction wages and prices may be compared with a 38 percent rise in the cost of living index, and do not encourage any thoughts of reductions in construction prices for labor and materials.

Construction employment reached a peak of 2,879,000 in September, 1941 (before the United States entered the war), with 58 percent on private work and 42 percent on public work. But in 1942 the proportion on public work was 75 percent (or 1,950,000). In 1945, the total of all construction workers had dropped to 671,000, of whom only 14 percent were on public works.

Total construction for the United States in 1946 was estimated by the government in February as \$1,400,000,000, and in July this estimate was raised to \$1,700,000,000. Public construction had been relatively low, but to check the continuing rise in cost of construction (a condition that was seriously reducing the amount of work that could be done for a given amount of money), the government in August ordered a two-month moratorium on all new Federal construction. Work already under way was not affected. It was also ordered that from October 1, 1946, to April 1, 1947, there should be a reconsideration of all Federal projects ready for contract letting, in order to determine

their economic standing and to decide as to their immediate necessity or postponement to a more favorable time. It was expected that State and local governments would take similar action. For the year 1946-1947, the government limited the

total construction of its various agencies to \$900,000,000, but in October it raised this limit to \$1,200,000,000, under political pressure.

The original limit was wise, as times were not favorable for government expenditures. In August, the construction field was competing with other fields for materials and labor, a condition that overwhelmed all efforts at price control or stabilization. It appeared evident that the national economy (including the construction industry) could be stabilized by sharply restricting Federal expenditures when times are good, thus building up reserves of credit and work projects for a coming period when business becomes slack.

TABLE II—PROGRESS OF CONSTRUCTION VALUES

1946, Actual.....	10,750	5,375
1947, Estimated.....	12,000	6,540

In view of the great and increasing importance of the construction industry, Congress, in 1945, authorized the organization of a Construction Division in the U.S. Department of Commerce. Its activities are in conducting statistical studies and research in economic problems, and it acts as a clearing house for information developed by various government agencies and by public organizations. An important development of the industry in recent years has been the handling of construction work on an all-year-round basis, instead of almost shutting up shop for the winter months or bad-weather seasons.

As to present conditions and the outlook for the future, predictions are more difficult than usual because so many government or Federal actions interfere with the logical or normal functioning of construction, and these Federal actions are unpredictable. However, the figures given in the accompanying tables, I to IV, have been prepared by *Engineering News-Record*, and are based upon its long and intimate knowledge of the industry. Table I shows the estimated and actual recorded expenditures for 1946, and the estimated expenditures for 1947. Table II shows the progress of con-

struction values for 1945, 1946, and 1947, and Table III gives the estimated annual expenditures at the end of a 5-year post-war term, or in 1949. In Table IV are given the geographical divisions of construction activities.

Middle Atlantic.....	24
Middle West.....	12
South.....	15
New England.....	6
Total.....	100

In sum, this Table shows an estimated expenditure of \$10,702,000,000 for new construction in 1946, and a predicted expenditure of \$13,181,000,000 for 1947. With maintenance and repairs added, the grand totals are \$15,852,000,000 and \$19,256,000,000 respectively.

A difference in totals of the two estimates for 1947 is due mainly to the fact that Table I covers only fairly large projects, while Table V includes

urban and rural construction of all sizes and types, as well as maintenance and repairs. Furthermore, until near the end of 1946, the *Engineering News-Record* estimate for total engineering construction in 1947 was \$7,500,000,000 instead of \$6,540,000,000 (Table I). But by that time, resistance to the high prices was developing and there was a growing sentiment for balancing the budget, all tending to check the prospective construction program. Bringing the estimate down to a conservative \$6,540,000,000 was effected by certain changes in the classified figures.

E. E. RUSSELL TRATMAN.

**CONSUMERS' COOPERATIVES.** The year 1945 marked another high point in the consumers' cooperative movement as regards membership, business, and value of goods produced. Operating reports, however, indicate that both local cooperatives and their central federations found 1945 conditions more difficult than those in any of the war years, and earnings were generally somewhat smaller than in 1944. Among the retail associations, the urban stores (generally handling groceries and meats only) found gainful operation more difficult than did the farmers' stores (which usually handle a wide variety of items). Petroleum associations on the whole had a relatively more successful year than did the store associations.

Credit unions, the business of which fell off seriously during the war years, had a slight loss in membership in 1945 (probably as a result of the closing of associations in liquidated war plants), but showed an increase in loans granted. They continued their unbroken advance in assets and capital.

Housing continued to be of outstanding interest, and many cooperatives for this purpose were formed throughout the United States. Because of supply shortages and inability (except by veterans' groups) to obtain priorities, very few reached the stage of actual construction by the end of 1946, though many acquired land. Medical care, another field of active cooperative interest, received impetus through the passage of a 1945 law in Texas authorizing the formation of cooperative hospitals in places of less than 2,500 population; some 20 hospital associations had been chartered by the middle of 1946. A number had also been organized in the Pacific Northwest. In Seattle the new medical-care cooperative merged with an existing doctor-sponsored plan; this step made available to co-operative members a 50-bed hospital and a staff of 18 physicians.

Student cooperatives providing rooms and/or meals began in 1946 to recover the ground they lost when the male students were drafted. Returned veterans were reported as forming purchasing, housing, and other cooperatives in many places. All of the war relocation cooperatives dissolved when those centers were closed. Reports indicate, however, that some of the Japanese-Americans who had participated in these associations were, upon their return to farming and other pursuits, joining local cooperatives or forming new associations of their own.

The most important event of the cooperative year was the national cooperative congress, held in September 1946. Its deliberations covered the whole range of cooperative effort in the consumer field. Among its most important acts were the transfer from the Cooperative League to National Cooperatives (the wholesale organization) of employee training, general educational work, and publicity in consumers' cooperation. This was intended to pave the way for the transformation of the Co-operative League into a federation of national organizations in various branches of the consumers' cooperative movement (distribution of commodities, credit, electricity, insurance, medical care, housing and recreation). A meeting of the board of directors of National Cooperatives previous to the congress, established as policy that in future all production on a national scale is to be carried on by National Cooperatives.

Underlining the increasing interest in international cooperation, a large delegation from the United States cooperatives attended the congress of the International Cooperative Alliance (its first

since 1937) in Zurich. Among other actions, the congress established an international petroleum co-operative and expanded the powers of the existing International Cooperative Trading Agency.

FLORENCE E. PARKER.

**CONTRACT SETTLEMENT.** Office of. Contract terminations began early in the war production program, and the need for procedures to settle terminated war contracts soon became apparent. At first the contracting agencies of the Government, principally the War and Navy Departments, the Maritime Commission, the Treasury Department, and the Reconstruction Finance Corporation and its subsidiaries, developed their own procedures. However, the need for uniform methods soon made itself felt, and the Joint Contract Termination Board, under the Office of War Mobilization, was established by the principal contracting agencies. The basis of unified action to settle terminated contracts was elaborated in the *Report on War and Post-War Adjustment Policies*, published by Bernard M. Baruch and John M. Hancock, who had been appointed as the Advisory Unit for War and Post-War Adjustment Policies of the Office of War Mobilization. This Report stressed the need for speed in the settlement of war contracts and for fairness to the contractor and to the Government. Subsequently, action by various Congressional Committees led to the passage of the Contract Settlement Act.

The Contract Settlement Act of 1944, Public Law 395, 78th Congress, which became effective on July 21, 1944, established the Office of Contract Settlement as the policy-making agency to prescribe policies, principles, methods, procedures and standards for the contracting agencies. Subject to the supervision of the Office of Contract Settle-

ment, the contracting agencies are responsible for carrying out the Act's objectives. Except for appeals, all contract settlement operations are carried out by the contracting agencies.

Robert H. Hinckley, a Vice President of the Sperry Corporation, New York, was appointed Director of Contract Settlement and assumed his duties on July 28, 1944.

As a first step, the Director provided for the continuance of the work which the Joint Contract Termination Board had under way. As a second step, he established an organization to perform the duties prescribed by the Act. This organization reflected the direction of the Act to utilize "the personnel and facilities of the contracting agencies and other established Government agencies" to the maximum extent feasible.

In addition to the Contract Settlement Advisory Board and Appeal Board, the OCS was divided into nine major units as follows: Terminations; plant clearance; interim financing; training; progress and statistics; public information; accounting; organization and procedures; and general counsel. To provide for effective cooperation with the contracting agencies, a system of advisory committees of the Contract Settlement Advisory Board was set up during the war. These standing committees paralleled organizational units of the Office of Contract Settlement. Each committee was established by the Director, who named a chairman from his own staff and asked each agency on the Advisory Board to designate a representative. The OCS was staffed by seventy-eight members at its wartime peak. During 1946, the personnel of the organization was reduced with the approaching completion of the settlement program and numbered nineteen on December 31, 1946.

While there are twenty-eight contracting agencies which may have war contracts subject to the Contract Settlement Act of 1944, the major burden of terminating and settling war contracts falls upon five of them: War and Navy Departments, the Maritime Commission, the Treasury Department, and the Reconstruction Finance Corporation and its subsidiaries.

**Progress in 1946.** Prior to 1946, the Office of Contract Settlement issued twenty regulations dealing with such matters as interim financing, plant clearance, pretermination agreements, standard settlement proposal forms, retention of records, accounting practices and other subjects. The issuance of these regulations facilitated the prompt settlement of terminated war contracts. During 1946, the OCS made three amendments to these regulations. Two of the changes dealt with the rules of practice and procedure for the Appeal Board of the Office of Contract Settlement. The other amendment dealt with the Termination Cost Memorandum on settlement expenses.

Reconversion of industry from war to peace was not hampered either by lack of adequate financing on terminated contracts or by failure of the Government to clear contractors' plants. Partial payments, guaranteed loans and utilization of advance payments proved more than adequate to finance industry in transition. Partial payments were the most usual financing obtained by terminated war contractors. At December 1946, over 3 billion dollars had been paid out by the Government in this type of financing. Plant clearance, both of termination inventories and of Government-owned equipment, proceeded smoothly throughout the year. In only a small percentage of cases did Government agencies require more than sixty days to clear plants. At December 31, 1946, completed clearances were brought to 7.3 billion dollars or 96 percent of the total job.

Representatives of industry have expressed their satisfaction with the way in which the Government handled contract settlement matters. By December 31, 1946, 158 appeals had been made by contractors to the Appeal Board of the Office of Contract Settlement in the settlement of more than 316,000 terminated war contracts. The reason for this negligible amount of litigation was attributed, in a large part, to the vast planning which went into the Contract Settlement Act of 1944 and policies and procedures thereunder.

Robert H. Hinckley retired as Director of Contract Settlement on January 31, 1946, and Colonel H. Chapman Rose, GSC, Deputy Director, was his successor. On October 1, 1946, Roger L. Putnam, former Mayor of Springfield, Massachusetts and wartime Deputy Director of the OCS, assumed the

duties of Director. Executive Order 9809, issued December 12, 1946, transferred the functions of OCS to the U.S. Treasury Department, and the functions of the Director to the Secretary of the Treasury.

The work growing out of the Government's contract terminations and settlements during World War II should be carried to completion in 1947.

The accompanying table gives the status of contract settlement as of December 31, 1946.

ROGER L. PUTNAM.

**COPPER.** With copper mine, smelter, refinery and brass mill production sputtering fitfully during the first seven months of 1946, shortage of finished copper products constituted a major problem to United States manufacturers most of the year.

Before settlement was obtained in an epidemic of strikes, which subsided in June, production of mines and smelters dropped about 50 per cent; refineries, 65 percent; brass mills, 12 percent; and copper wire mills, 5 percent. Foundries were less affected, but experienced difficulty in securing sufficient scrap and ingot.

Production of United States mines for the year was close to 602,355 short tons (1945: 772,894 short tons). An important factor in the drop was a strike lasting five months at the Bingham Canyon, Utah, mine of Utah Copper Co., the world's largest, which was settled the last week in June. Also seriously affected by strikes were Anaconda Copper Mining Co. mines in Montana during April, and mines in Arizona, where work resumed late in June. Michigan mines operated on a greatly reduced scale in May and June because of shortage of coal resulting from the nationwide bituminous coal strike. Thus the nation's principal producing areas all were seriously affected. Labor difficulties on a comparable scale affected smelters, refineries and rolling mills. Strike settlements in the mines were sparked by an agreement by the government to authorize increased prices and adjustments in payments under its Premium Price Plan to mines granting wage increases. Effective June 3, the Office of Price Administration advanced the ceiling price on copper to 14½ cents per lb. from 12 cents, the price in effect since the institution of price ceilings.

Commercial transactions in the industry were confused during the period of lapse of price control from July 1 to 26. Many smaller mines halted operations because of uncertainties over the future of the Premium Price Plan (See 1944 and 1945 YEAR BOOKS), involved in the same legislation, which had provided them a bonus for over-quota production. With lifting of price control November 10, the price of copper jumped immediately to 17.5

STATUS OF CONTRACT SETTLEMENT  
(All Terminations and Settlements; All Reporting Agencies)

Date	TERMINATED		SETTLED		PENDING	
	Number of Contracts (approximated to nearest thousand)	Cancelled Commitment Value (approximated to nearest billion)	Number of Contracts (approximated to nearest thousand)	Cancelled Commitment Value (approximated to nearest billion)	Number of Contracts (approximated to nearest thousand)	Cancelled Commitment Value (approximated to nearest billion)
Dec. 31, 1944.....	128,000	\$25.5	117,000	\$13.9	11,000	\$11.6
April 30, 1945.....	145,000	29.7	137,000	19.4	8,000	10.3
(V-E Day May 7).....						
June 30, 1945.....	165,000	37.0	150,000	22.3	15,000	14.7
July 31, 1945.....	174,000	38.5	157,000	23.6	17,000	14.9
(V-J Day Aug. 14).....						
Aug. 30, 1945.....	271,000	60.9	165,000	24.7	106,000	36.2
Dec. 31, 1945.....	303,000	63.9	250,000	30.4	53,000	33.5
June 30, 1946.....	317,000	65.2	305,000	54.2	12,000	11.0
Sept. 30, 1946.....	315,000	65.3	312,000	59.0	6,000	6.3
Dec. 31, 1946.....	319,000	65.4	311,000	61.8	3,000	8.6

cents per lb., and reached 19.5 cents by year-end. As in previous years, Arizona, Utah and Montana were the leading states in mine production.

Interruptions in production were reflected in severe shortages of copper wire and cable. Manufacturers of electric motors and transformers were forced to restrict operations, and the otherwise complete household appliances in turn were held from completion. The automobile industry also was indirectly affected.

Some of the shortage of refined copper, particularly during the strike interruptions was made up by sales to private industry from the government stockpile, which declined as a result from 499,900 tons at the end of 1945 to 232,613 tons August 31, 1946. Refinery output, from foreign and domestic ores was 904,000 tons (1945: 1,108,599 tons). Imports also were affected during the period of uncertainty over price legislation. A government purchase program, attempting purchases abroad, was unable to secure desired commitments. Labor troubles and competitive purchasing by Great Britain in Chile, the principal foreign source, reduced actual imports. In the world market generally, the United States found itself competing with world reconstruction demands. Heavy British commitments were made for Rhodesian and Canadian production. Imports into the United States of unmanufactured copper were 400,000 tons in 1946 (1945: 853,196 tons).

Consumption of copper decreased sharply in comparison with war years (1945: 1,542,403 tons of new copper) although the approximate 1946 total of 1,033,000 tons was high for a peacetime year.

CHARLES T. POST.

**COPYRIGHT.** Registrations for fiscal year 1945-1946, according to the report of the U.S. Register of Copyrights, numbered 202,144, as compared with 178,848 for the preceding year. Of these 47,878 were classed as books, but included pamphlets, leaflets, and contributions in periodicals. Those printed in the United States numbered 44,365; those printed abroad in a foreign language, 3,513; while the remainder, 610, registered for ad interim copyright. The chief classes of the remaining registrations were: Periodicals (numbers) 48,289; Musical Compositions 63,367; Dramatic or Dramatico-Musical Compositions 5,356; Works of Art, Models or Designs 3,094; Drawings or Plastic Works of a Scientific or Technical Character 1,777; Prints and Pictorial Illustrations 5,384; Maps 1,304; Lectures, Sermons, Addresses 1,129; Motion Pictures not photoplays 1,250; Motion Picture photoplays 774; Reproductions of Works of Art 317; Commercial Prints and Labels 7,975. The renewals numbered 12,483 as compared with 11,337 in the preceding year. The fees applied during the year amounted to \$379,738. The total number of separate articles deposited during the fiscal year ended June 30, 1946, was 305,049. The gross receipts of the Register's office for the fiscal year were \$405,740.58; the total expenditures for salaries, \$350,150.33; and for supplies, postage and photoduplication, \$2,843.33.

**CORSICA.** A French island department in the western Mediterranean, 100 miles southeast of Nice. Area, 3,367 square miles. Population (1936), 322,854. Chief towns: Ajaccio (capital), 38,000 inhabitants; Bastia, 52,208.

**COSTA RICA.** A republic of Central America. Area: 19,238 square miles. Population: 725,149 (official estimate, December 1944). Capital: San José.

Costa Rica has low tropical coastal plains and a mountainous interior. The Meseta Central, a highland plateau of 3,000 to 4,000 feet elevation, enjoys a temperate climate and is the center of the country's population and industry.

**The People.** According to the census of 1927, about 80 percent of the people of Costa Rica are of almost pure Spanish descent; 14 percent mestizo; 4 percent Negro, and 2 percent Indian. Seventy-five percent live in the Meseta Central. The largest cities are: San José, 75,000; Heredia, 10,000; and Alejuela, 10,000.

Spanish is the official language, but English is taught in schools throughout the country and is spoken widely in the eastern lowlands. Roman Catholicism is the state religion.

It is estimated that 82 percent of the total population is literate. In 1943 there were 797 primary schools with a total enrollment of 75,150; 49 secondary schools with a total of 7,251 students; and the National University of Costa Rica had a student body of 820. Primary education is compulsory. Under the school law of 1945, matriculation and tuition in the Government's secondary schools is to be free to all students whose parents or guardians own no other property than the house in which they live.

**Government.** Under the Constitution of 1871, Costa Rica is a centralized republic of 7 Provinces. It has a unicameral legislature of 45 members, elected for 4-year terms, one-half being elected every two years. The President is elected for a 4-year term, and is assisted by a Cabinet of 9 ministers. President Teodoro Picado Michalski was elected on Feb. 13, 1944, and assumed office on May 8, 1944.

**Events, 1946.** A vigorous political campaign for the election of twenty-three legislators, one-half the unicameral Congress, closed on February 1 with more than 150,000 registered voters casting a ballot. The opposition to the Picado Administration was led by former President Leon Cortes, publisher of *The Diario de Costa Rica*, Otilio Ulate and Dr. Antonio Pena Chavarria. The election results gave the Government eleven seats, the opposition ten and the Communists two.

In early September Foreign Minister Julio Acosta signed an agreement with El Salvador abolishing passports and substituting Central American tourist cards.

Because of dissatisfaction with the United States price ceiling on coffee, Costa Rican producers decided in late September to ship at least 30 percent of the 1946 crop to Europe. Previously almost 90 percent of the crop was sold to the United States. The coffee crop, however, suffered extensive damage in October because of a locust plague that also ruined large portions of the rice crop.

In an almost unanimous vote, Congress approved a motion to have the Costa Rican representatives at the United Nations support those members who desired to break relations with Spain. At the same time the Foreign Minister instructed all consuls in Spain to maintain lists of all German sympathizers so that their admission to Latin America via Costa Rica could be prevented.

The Latin American Federation of Labor, meeting in mid-December in San José, approved a resolution charging the American Federation of Labor with being an instrument of "Yankee" imperialism. The conference also condemned the Clayton plan for the abolition of tariff barriers and President Truman's continental defense plan.

**National Economy.** Agriculture and agricultural processing are the leading occupations of Costa

Rica. Coffee, bananas, and cacao are the most important crops. There are also small lumber and pastoral industries. Total production of green coffee beans during the 1945 crop year amounted to 30,000 metric tons. Normally Costa Rica produces between 100,000 and 120,000 bags (150 pounds net) of cacao annually, and exports about 80 percent. Banana cultivation is one of the main industries of the country; practically all of this crop is exported to the U.S.

Manufacturing in Costa Rica includes plants for coffee-cleaning and for grinding coffee and cacao, rice mills, sawmills, sugar mills, shoe factories, extraction of edible oil, cotton textiles, and handicrafts.

**Foreign Trade.** In proportion to its population Costa Rica has a larger foreign trade than any other Central American country except Panama. In 1945 exports totaled 11,611,709. Exports of coffee during the 1945 quota year totaled \$7,488,761. Banana exports in 1945 totaled \$2,232,679. Coffee exports accounted for about 64.5 percent and banana exports for about 19.2 percent of the total exports. Costa Rica exported gold bars in 1945 valued at \$87,231. Other exports were: fruit, vegetables, honey, hides, and skins.

In 1945 Costa Rica's imports totaled \$26,948,122, consisting chiefly of manufactured products and foodstuffs.

**COURT GAMES.** Robert Grant 3d of Oyster Bay, Long Island, added considerable lustre to his fame as the greatest racquets player in America when he won the national court tennis and racquets titles last year. He became the first man to take both championships in the same year since Eustace H. Miles, an Englishman, turned the trick in 1900.

Grant, who had an aircraft carrier shot from under him in the war, defeated Robert Gerry Jr. of Wheatley Hills, Long Island, 6-2, 3-6, 6-1, 6-4, in the court tennis final a few weeks after annexing the racquets laurels. The youthful New Yorker and Clarence C. Pell Jr. renewed their doubles partnership and added to the skein of triumphs they started in 1936 when they carried off the United States racquets championship. Grant maintained his domination of all singles opposition when he turned back J. R. Leonard, ex-national ruler, in the final of the Tuxedo Gold Racquet tourney to gain his second leg on that coveted prize.

A number of other top-notch court events returned to the calendar, among them being the national Class A squash tennis tournament, not held in four years. Frank R. Hanson, the Columbia University Club ace, won that test when he defeated H. Robert Reeve of the Bayside T.C., the 1942 victor. The triumph gave Hanson just about a sweep of the season's major squash honors, for he previously had won the New York A.C. and Yale Club competitions.

Lester Cummings of the Field Club of Greenwich took the big prize in squash racquets when he halted Al Ramsay of Cleveland, 1940-41 champion, for national professional laurels. A United States team, captained by Seymour Knox of Buffalo, recorded its sixteenth triumph in the 25-year-old Lapham Cup series when it routed a Canadian squad, 13-2. The national Intercollegiate Squash Racquets Association title was won by Glen Shively of Yale.

THOMAS V. HANEY.

**CRANBROOK FOUNDATION.** A foundation in Bloomfield Hills, Mich., established in 1927 for the purpose of adding to and strengthening educational

and cultural facilities within the State of Michigan. It is developing a cultural center at Bloomfield Hills in which are included Brookside School Cranbrook, a day school for children from kindergarten through the sixth grade, Cranbrook School and Kingswood School Cranbrook, boarding and day preparatory schools for boys and girls respectively, Cranbrook Academy of Art, Cranbrook Institute of Science and Christ Church Cranbrook. Chairman of the Board of Trustees: George G. Booth.

**CRETE.** A mountainous island in the eastern Mediterranean, forming the most southerly part of Greece. Crete was occupied by German armed forces during May, 1941, and was recaptured by Allied armed forces in 1945. During 1946, the British Government established internment camps on the island for the detention of Jewish refugees intercepted while attempting to enter Palestine from Europe. It is 160 miles long and from 6 to 35 miles wide. Area, 3,235 square miles. Population, 441,687 on Jan. 1, 1939. Chief towns: Canea, the capital, 26,604 inhabitants; Candia, 33,404; Rethymnon, 8,632. There are good harbors along the northern shore, particularly at Suda Bay, but the south shore has no satisfactory ports.

**CRIMINOLOGY.** Human activity involves a steady process of adjustment of individual personality to the ever-increasing, ever-changing elements of environment. The human make-up is so complex, the differences in environmental influences so wide-sweeping that it is difficult to explain criminal behavior by any one factor. It is well recognized that crimes differ in seriousness, in nature, in apparent motivation, and in the kinds of behavior used to commit them. They spring from different types of personality and various kinds of situations. These changes in the elements which go to make up crime argue well for the contention that there is no one cause of crime.

The shortcomings of human beings have manifested themselves in all types and forms down through the centuries. Anger, jealousy, greed, avarice, and scores of other human aberrations have made crime an ever-present condition. A study of causative factors in crime necessarily must include the study of man and the adaptation of every personality to the varying elements of environment.

There has been some advancement made in determining causes of crime. It would appear that the best approach to the problem lies through a study of the individual criminal in relation to all the social and environmental factors which have an influence upon his personality. Such research considers the criminal or delinquent not only as an individual but also as a member of many groups—the community, the family, the work group, the play group, and others—each of which has provided him with values and attitudes with which he faces the outside world. Study patterned along these lines has eliminated one-sided explanations of crime, which have not been particularly valuable.

While the value of research work into mental and physical characteristics of criminals cannot be discounted, it is well known that a study of the development of a wrongdoer produces sound data. Definite steps have been made in determining some of the influences which contribute to the creation of the adult professional criminal. Criminal careers usually have their beginnings in childhood and early youth, and they are marked by a progressive gravity in the offenses committed. The Federal Bureau of Investigation and other law enforcement

agencies possess convincing evidence of influences which pave the way for antisocial behavior.

The failure of the family to create within the home an effective educational medium, the exposure of youth in communities to crime-infected areas and contacts with delinquent groups or gangs, the lack of community action to meet the problem of delinquent behavior, and many other influences are known to originate significant factors in the crime situation.

The effect of economic factors in crime causation cannot be overlooked. Times of depression are times of unemployment which means economic distress for thousands of workers. The volume of crimes against property increases during periods of economic instability. The answer may be in the fact that some persons refuse to accept a changed material status which prevents them from enjoying all the things to which they were accustomed in normal times.

The power of the venal politicians to influence the processes of law enforcement accounts to some degree for the gravity of the criminal situation. It is generally recognized that parole and probation are constructive and desirable systems in the administration of justice. The poor and inept exercise of such systems constitutes a menace and hindrance to a program of judicial administration. All such systems should be governed by carefully selected, well-qualified, and properly trained personnel and should be free from corrupt political authority or manipulation.

Social, economic, and political factors in the light of a nation's development, therefore, are considerations in the study of crime causation.

Although it is known that there has been no formula established which would completely prevent crime and delinquency among people of any age, it should be conceded that governments have no more serious and important responsibility than the protection of society. This is the first duty of law enforcement. The effectiveness of the police against criminal elements has been hampered by the indifference of citizens. People who leave their homes and automobiles unlocked or who are notoriously careless with their personal effects make it easy for the thief to commit crime. An important agency for crime prevention is education—the enlightenment and illumination of the mind to a sense of civic responsibility and justice. Law enforcement, through various media, is attempting to educate people to assume their duties in the matters of crime prevention and law enforcement.

Education has bolstered the profession of law enforcement. The Federal Bureau of Investigation founded the FBI National Academy in 1935 in order to provide a program of training for local and state law enforcement officials and officers. With the completion of the Thirty-third Session of the Academy on October 4, 1946, 1,470 selected officers from every state in the United States as well as from Mexico, the Panama Canal Zone, Alaska, China, the Philippine Islands, Puerto Rico, England, Canada, and Newfoundland have made the benefits of FBI training available to approximately 100,000 of their associates. At the request of local authorities, the FBI cooperated in 773 general police training schools, which were attended by about 38,650 officers during the 1946 fiscal year. During the same period, some 100 police executives and officials were present at fifteen state-wide police administration schools. Two series of FBI Law Enforcement Conferences also were held during this time. A grand total of 53,588 officers attended these conferences.

The development and expansion of techniques and methods in law enforcement have aided the police to discharge more proficiently their obligation to enforce the law, and prevent crime. Law enforcement in the United States has the best statistics on a national basis showing the extent, scope, fluctuation and trend of crime, including juvenile delinquency. The Uniform Crime Reports prepared by the FBI from monthly and annual reports submitted by law enforcement agencies throughout the nation serve as an index to crime trends and the extent of crime in the United States.

Coordinating their activities on a nationwide basis, acquainting themselves constantly with the focal points of criminal infection in the various communities, performing their regular duties on a twenty-four-hour-day basis, usually having the first contact with the juvenile delinquent, and extending their knowledge as to the methods employed by all types of criminals regardless of age, law enforcement today is faced with retarding influences which prevent the most effective offensive against the causes of crime. Inadequate salaries and insufficient advantages for police personnel, a shortage of personnel in police departments, the failure to seek police opinions concerning proposed legislation affecting law enforcement, crime prevention and the handling of juveniles, have impeded law enforcement from fully carrying out crime prevention work.

It is the responsibility of the community to keep alive the fact that prompt detection, vigorous and quick prosecution, and the adequacy and certainty of punishment fitted to the crime and the criminal are definite deterrents to the commission of crime. It is also the obligation of the community and every member of it to impart, by precept and example, the necessity for proper respect for the laws of the nation, the state, the county, and the municipality. Such a program would channelize human behavior along the lines needed to bring about an appreciable reduction in the volume of crime.

JOHN EDGAR HOOVER.

**CROSS-COUNTRY RUNNING.** Robert Black, Rhode Island State freshman, stole the show in the national A.A.U. hill-and-dale championships last Fall, scoring a sterling triumph in the junior run, and coming back a week later to capture the senior title. James O'Leary, Holy Cross harrier, was runner-up on both occasions.

The senior run was marked by the return to competition of Don Lash, one of the country's best distance men of all time. The ex-Indiana star, who had won the event seven straight times, but whose F.B.I. work had kept him out of racing the past six years, finished seventh in the title chase.

Team honors in the senior test were retained by the New York A.C., and New York University paced by Frank Dixon, a consistent scorer all season, won the junior laurels.

Curtis Stone of Penn State stood out in college cross-country, annexing the Intercollegiate A.A.A.A. crown and finishing second to Quentin Brelsford of Ohio Wesleyan in the National Collegiate A.A. grind. Black, the double winner in A.A.U. championships, added to his prestige with a good second in the I.C.4-A event. A well-balanced N.Y.U. outfit, which previously had won metropolitan intercollegiate honors, took the I.C.4-A team title and was runner-up to Drake, defending champion, in the N.C.A.A. race.

Gerard Cote, Quebec star, led home a crack field in the national A.A.U. marathon, while the Millrose A.A. was team victor in the grueling race of

26 miles, 385 yards. Stylianos Kyriakides, a true son of the Grecian immortal, Pheidippides—who ran the first marathon—came over from war-ravaged Athens to carry off honors in the Boston Athletic Association's fiftieth anniversary run. Competing in the most capable marathon field ever gathered for the classic, Kyriakides closed with a burst of speed to win in 2:29:27. Johnny Kelley, the 1945 winner, who raced shoulder to shoulder with Kyriakides for almost 25 miles, crossed the finish line two minutes back of the Greek star to annex second place.

THOMAS V. HANEY.

**CUBA.** An island republic of the West Indies. Area: 44,217 square miles. Population: 4,778,583 (1943). Capital: Havana.

About one-fourth of the island is mountainous; the remainder is composed of lowlands, terraces, and gentle slopes. There are no extremes of temperature and little variation between summer and winter. The rainy season is from May to November.

**Population.** Sixty-five percent of Cuba's population belong to the white race; Negroes, mestizos, and other races compose the remainder. Density of population ranges from 48 persons per square mile in the Province of Camaguey to 389 in the Province of La Habana. The largest cities are: Havana, 678,376; Marianao, 114,743; and Santiago de Cuba, 120,577.

Spanish is the official language of Cuba. The predominant religion is Roman Catholic.

It is estimated that from 60 to 70 percent of the population over 10 years of age is literate. In 1941 there were 5,982 primary schools teaching a total of 537,756 children; 168 secondary schools had a total enrollment of 27,423 in 1938-39. The University of Havana had 13,940 students in 1941.

**Government.** Cuba, under the Constitution of 1940, is a centralized republic of 6 provinces. It has a bicameral Congress; a Senate of 54 members, and a House of Representatives of 114. The Congress convenes twice a year, in March and September, for not less than 60 days. The president is elected for a 4-year term and is aided by a Cabinet of 17 ministers, 4 without portfolio. Dr. Ramón Grau San Martín was elected President on June 1, 1944.

**Events, 1946.** Sugar, the mainstay of Cuba's economy, developed into a live issue during January and February when President Grau San Martín proposed to use part of the profits from the export of sugar to finance a governmental program for building schools. Except for 250,000 tons all Cuba's sugar exports went to the United States at 3.675 cents a pound. The remaining 250,000 tons were placed on the world market and sold at 8.5 to 9 cents a pound. The President suggested that the Government purchase the world allotment at the United States price, sell it on the world market and use the profit for federal expenditures.

Vigorous opposition to the proposal was heard from the National Cane Planters Association, who claimed that the profits were needed to improve field conditions and import new machinery. Unless this were done, they said, sugar planters in Cuba would not be able to produce cheaply enough to compete in the future world sugar market.

The President's proposal was supported by Cuba's Communist party which was staging its Third Annual Assembly in Havana. On February 15 the Council of Ministers approved the Presidential decree on the world market sale of sugar.

During the Communists' meeting, motion was passed condemning United States imperialism and

plans were outlined to unify Latin America in resisting this "imperialism." At the meeting the Communists announced new efforts to organize the masses and increase the scope of their educational program, with particular attention to youths, of whom 50,000 were already organized, according to party leader Blas Roca. The Communist party of Cuba was recognized as one of the best disciplined parties in the Western Hemisphere. With 151,000 members, the party is the most potent force in organized labor, owns one of Havana's larger newspapers (*Hoy*), controls the voting balance in the Senate and exerts considerable influence in the Ministry of Labor.

In return for the purchase of sugar at a price below the world market figure, the United States agreed to guarantee in 1946 shipment to Cuba of 1,200,000 tons of wheat flour, 60,000,000 pounds of lard, 75,000,000 pounds of rice, 25,000,000 pounds of vegetable oils, 24,000,000 pounds of tallow and unspecified quantities of petroleum and its by-products. All sales were subject to 1942 price levels. On February 6 Cuba announced that 20,000 tons of sugar from its 1946 crop would be reserved for the United Nations Relief and Rehabilitation Administration.

After seven months of negotiations, the United States announced on April 1 that all military bases built by the United States in Cuba during the war would be relinquished on May 20. The agreement did not affect the naval base at Guantanamo which was ceded to the United States in 1902.

An incipient rebellion was quashed on May 17 when Government forces captured non-commissioned officers who attempted to lead a group in the capture of Camp Columbia, a military reservation. Reports on the "rebellion" from Government sources gave no details or information on the number and names of those captured. On June 8 Chief of Staff General Genovero Pérez said that the soldiers arrested in the attempted coup would be released and discharged from the army.

President Grau San Martín's leftish *Auténtico* party and Communist supporters appeared to win a decisive victory in the June 1 elections at which one Senator, half (sixty-six) the House of Representatives, 126 mayors and 2,000 councilmen were elected. The mayoralty of Havana was won by Dr. Manuel Fernández Supervielle, the *Auténtico* candidate, who polled more than twice the number of votes of his opponents, the Republican-Democrats' Dr. Raul Menocal, who ran for re-election, and the Liberals' Dr. Carlos Miguel de Cespedes. In the House of Representatives the *Auténtico* party and the Communists achieved a majority control. Previous to the election, the *Auténtico* and Communist parties ruled the Senate but were a minority in the House.

Revision in the Cuba-United States sugar agreement was made in early July to include an "escalator" clause by which the price paid will rise at a given ratio to the cost-of-living index in the United States. The clause reportedly was included on Cuba's insistence to satisfy her that the money received would purchase the same quantity of goods in the United States a year in the future as the prevailing prices assured.

During July Communist denunciations of United States "imperialism" grew more vigorous. Lazaro Peña, Communist leader of the Confederation of Cuban Workers, asserted that his party would side with the Soviet Union against the United States and Great Britain in the event of an "imperialist war." Regarding Cuba's national politics, Peña said that the party supported the Grau San Martín

administration because it recognized the interests of the workers. The friendly relations between Pena and the President were evident in mid-July when both addressed a labor rally of 30,000 from the Presidential palace.

A wave of killings that reached 48 since President San Martín took office in 1944 aroused such mounting public indignation that Gen. Aberlardo Gómez, second in command of the army, was appointed chief of the National Police. The victims usually were strongly linked with the Machado and Batista regimes and their deaths were attributed to the work of revolutionary groups who suffered under the dictatorial governments of the two former Presidents.

After Cuba had arranged for the increase in the price of sugar to the United States, President San Martín announced that the Government would take the price differential and use it to subsidize food imports. To stem the storm of protest that arose from the sugar owners, the Government appointed a committee to study a suitable plan. During December the Government abandoned its plan to seize the price differential profits. Because of the rise in sugar prices, Cuban sugar workers were given \$17,500,000 as an advance on the increase due on their 1946 wages. The workers' wages are pegged to prices.

**National Economy.** Cuban economy is dependent on sugar and tobacco. More than half of the persons gainfully employed are engaged in agriculture, and of these, 70 percent work in the sugar industry. The 1945 sugar crop amounted to 3,920,000 short tons. This represented a drop of 30 percent from the 1944 production figure. The decrease was due to a severe drought. Tobacco is Cuba's second crop in export importance. The 1945 crop of 67,000,000 pounds was the largest since 1931, and over 50 percent larger than the 1943 crop. Other important Cuban crops include corn, grown chiefly for domestic consumption; pineapples, bananas, and henequen, which are exported.

Cuba's most important manufacture is the production of sugar from cane. Tobacco manufactures are also important, and other products include: rope and cordage, shoes, cement, paint, and agricultural tools and implements.

**Foreign Trade.** Cuba's foreign trade totaled \$648,860,236 in 1945, over 25 percent more than the total for 1943. Exports were valued at \$409,924,729. Of total exports in 1945, the United States took 78.8 percent, valued at \$323,330,537, a decrease of about 14.9 percent compared with the value in 1944. Cuban exports to Europe were valued at \$55,813,572. Exports of sugar and other cane products in 1945 were valued at \$243,000,000. The value of tobacco exports reached \$50,400,000 in 1945.

Cuban imports in 1945 reached a total value of \$238,935,507, the highest since 1929, exceeding the 1944 figure by 14.5 percent. Of the total, the United States supplied 74.4 percent, valued at \$187,962,683. Imports from Europe were valued at \$12,396,038, imports from Asia, \$5,516,819. Cuba's chief imports are: foodstuffs, textiles, manufactured products, machinery and other equipment.

JOSEPH P. BLANK.

**CUSTOMS, Bureau of.** The end of the second world war did not permit the immediate resumption of prewar trade although it did relieve the Customs Service of many of its wartime duties. After V-J day, particularly, most of the restrictions on travel were discontinued and the export restrictions in some cases removed. As the year progressed Euro-

pean countries which had been blacked out from trade for years began again to send some of their products to the American market, which resulted in a progressively increasing volume of business, and in larger collections than for any year, except one, since the passage of the present Tariff Act in 1930.

**Customs Collections.** Total collections during 1946 aggregated \$588,034,507, an increase of 4.8 percent over the total for the previous year, but considerably less than the all time high (\$757,251,316) in 1944. Actual customs collections, however, in the form of duties and miscellaneous receipts aggregated \$440,725,085, an increase of 23.1 percent over collections in the preceding year and \$6,466,047 more than in 1944. Collections for other agencies, which consisted chiefly of Internal Revenue taxes on imported liquors and wines, were much less in 1946 than in either of the two preceding years due to decreased importations of alcoholic beverages after the removal of limitations on the manufacture of distilled spirits in this country. The general trend of customs collections during the year was upward, from a seasonal low of \$29,030,851 in September to a high of \$45,487,295 in April. This rise was not continuous, recessions occurring in December, February, and June with successively higher peaks in October, January, and April. The collections for each quarter during the year exceeded those of the previous quarter.

Wool and wool manufactures, which have been the largest single source of customs revenue during each of the past six years, continued to lead all of the other tariff schedules in this respect, accounting for \$165,206,165 or 38.5 percent of the total duties collected in 1946 and far exceeding collections from this source during any previous year in customs history. Duties on spirits, wines, and other beverages continued to decline, the total from this source in 1946 (\$43,637,160) reducing the rank of this tariff schedule to fourth in importance. Duties on agricultural products, on tobacco, and on sugar were also smaller than during the previous year, the small amount of revenue derived from sugar being due to the admission duty free, under the terms of Executive Order 9177, of most of the sugar brought from Cuba and other countries. All of the other schedules of the tariff act yielded increased revenue as commodities from Europe and the Orient again reached the American market.

The war's end caused considerable changes in the territorial sources of customs revenue. Although duties on European goods were far from reaching their prewar level, they aggregated \$100,757,579 in 1946 or 23.5 percent of the total duties collected and were the largest source of customs revenue, exceeding the amount of duties collected from either North and Central America or South America which were the leading sources of customs revenue during the war years. Switzerland was the most important European source of customs revenue due to the very large shipments of watches and watch movements received from that country. For the first time in customs history, Australia led every other country in the world, as the largest single source of customs revenue, due to the heavy volume of wool received from the Antipodes. Although Canada ranked second in importance as a source of customs revenue in 1946, a smaller amount of duties was collected on Canadian goods than in the previous years. Third in importance was Argentina, another heavy wool exporting country, while Cuba, due to the admission of much of its sugar duty free, was only sixth

in importance in 1946 as a source of customs revenue, falling behind Switzerland and United Kingdom which ranked fourth and fifth, respectively.

**Volume of Business.** Entries of merchandise were much more numerous during the past year and border traffic was much heavier than in 1945. It is noteworthy, however, that rail traffic declined while automotive, vessel, and air travel to foreign countries increased. 958,156 persons arrived by air from foreign countries during the past year compared with 18,798 thirteen years ago.

**Law Enforcement.** As a part of the enforcement of customs laws a considerably larger number of seizures was made than during any year since the repeal of the Eighteenth Amendment. A part of the increase in the number of seizures was due to increased tourist travel, which was reflected in large increases in the value of jewelry, furs, and wearing apparel seized, and in part to the larger number of seizures of liquor, narcotics, and other prohibited articles during the past year.

W. R. JOHNSON.

**CYPRUS.** A British island colony in the eastern Mediterranean, 40 miles from the Anatolian Peninsula and 60 miles from the Syrian coast. Area, 3,572 square miles. Population (1944 estimate), 424,656. Capital, Nicosia (28,186). The administration is in the hands of a governor, assisted by an executive council. The legislative council was abolished in 1931 and the constitution suspended. There is an informal advisory council.

The majority of the inhabitants speak a Greek dialect and profess the Greek Orthodox faith. About one-fifth are Turkish-speaking Moslems. There are small Maronite and Armenian minorities. The educated classes speak English and French. Each religious group has its own schools, and the primary schools are under government supervision.

The budget estimates for 1945 were: revenue £2,833,477; expenditure £3,394,075.

One of the first acts of the new British Colonial Secretary, Arthur Creech Jones, was to announce in October, 1946, that the 18 trade unionists serving sentence for political agitation would be released. This was followed by the announcement of a new constitution, to be discussed by a special Consultative Assembly of representative Cypriots. Laws preventing the free election of a new archbishop are to be repealed and persons deported from Cyprus for their part in the 1931 disturbances will be permitted to return. The appointment of Lord Wister as Governor was announced on October 7, 1946.

Cyprus was constantly in the news in 1946 as the area to which illegal Jewish immigrants to the Palestine mandate were taken by the British. Large camps were established. Deteriorating conditions in the camps produced British investigations, the results of which tended to show that there was a considerable amount of sabotage and destruction of facilities in the camps by the inmates.

The island has a dry climate, but excellent fruits are raised. Grazing has been an important occupation, but the Government has recently attempted to encourage farming instead of grazing, a movement which has been resisted by the traditional goatherds, who have long been at odds with the farmers. Tree planting and the building of wells and reservoirs have been stimulated by the Government. The chief exports are animal products and agricultural products. Foreign trade (1944): imports £4,804,767; exports £2,452,496.

ALZADA COMSTOCK.

**CZECHOSLOVAKIA.** A republic in central Europe which was under German control from March, 1939, until its liberation by Allied armed forces in 1945 (see *Events* below). Area: 49,373 square miles (excluding Ruthenia ceded by treaty to the U.S.S.R. in 1945). Population (1930 census): 14,000,000 (excluding those in Ruthenia). Capital: Praha (Prague), 924,000 inhabitants (1946). Other important cities: Brno (Brünn), 288,900 (1946); Moravská Ostrava, 175,600 (1946); Bratislava, 157,700; Plzeň (Pilsen), 122,800 (1946).

**Production.** Agriculture is the predominant industry with 41 percent of the total land area devoted to farming. In 1945, the estimated yield of the harvest was (in quintals): rye, 11,088,394; wheat 8,912,873; barley 4,253,650; oats 6,438,280. In 1945 there were 98 sugar factories, which produced 402,291 metric tons of sugar. The total number of factories was 18,318, of which 2,171 were textile mills and 3,313 glass works and stone factories.

**Government.** After World War II, the Constitution of 1920 was restored in principle. Within the framework of the Czechoslovak Republic, Slovakia was granted provisional self-government and the Slovak National Council in Bratislava was recognized as the organ of legislative power in all matters not reserved for the joint Czechoslovak Government. On October 28, 1945, the Provisional National Assembly in Prague confirmed President Eduard Beneš (elected December 18, 1935) in office. Temporary emergency legislation is carried out by Presidential decree.

**Events.** Amid the arduous tasks of reconstruction the Republic of Czechoslovakia, like all of its neighbors, found its troubles multiplied during 1946 by the global clash of interests and ambitions between the Soviet giant and the American colossus. Its leaders and peoples, cherishing bitter memories of Munich, had long since cast their lot with the U.S.S.R. rather than with the Western Powers. While preserving a greater measure of procedural democracy and personal freedom than any of the other States within the Soviet sphere, they were nevertheless committed to collaboration with Moscow in foreign affairs and to economic collectivism in domestic policy. This orientation was deplored by the United States State Department, which expressed its displeasure in ways causing pain in Prague without producing any significant change of course.

**Retribution.** The punishment of Nazi criminals and the expulsion of Sudeten Germans and Magyars continued to occupy a large share of public attention during the year. On May 1 Karl Hermann Frank, erstwhile Nazi Protector of Bohemia and Moravia, was sentenced to death by the People's Court which found him responsible for the massacre of Lidice and other atrocities. He was publicly hanged in Prague on May 22. On October 23 Deputy Protector Kurt Daluege, who had ordered the execution of thousands of Czechs, was hanged as a common criminal after two unsuccessful attempts at suicide. Father Joseph Tiso, chief of the Nazi puppet-state of Slovakia after 1939, was brought to trial in December. Evidence introduced at Nuremberg against Baron von Neurath documented what had long been known: that the Nazi rulers of the land, 1939-1945, had sought to stamp out all sentiment of nationality by exterminating the intelligentsia.

The treasonable role of many members of the Sudeten and Hungarian minorities in the tragedy of 1938-39 explained, if it did not justify, the decision of the Czechoslovak leaders to expel both

groups from the country. In February an accord was reached with Budapest for the exchange of 100,000 nationals on each side. But on June 27 Prague asked the Council of Foreign Ministers to approve the deportation to Hungary of 200,000 more Magyars and to require Hungary to return 100,000 Czechoslovak nationals from Hungarian territory. A month later it was announced that half of the 3,200,000 Sudetens had already been expelled and were largely in the American and Soviet zones of Germany. By the end of the year, according to plan, only 60,000 would remain—chiefly skilled workers and older people. Meanwhile, some 2,000,000 Czechs, Slovaks, and Jews were settled in the former Sudeten areas.

In August Prague proposed to transfer a thin slice of frontier territory to Hungary in return for the acquisition of an enlarged Danube bridge-head south of Bratislava. In insisting upon the exchange of populations, President Beneš asserted (August 17) that "not a single man in Czechoslovakia would be ready to agree that we should again try to carry out a policy which was instrumental in producing the surgical operation of Munich." Early in October the Paris Peace Conference approved the transfer of a reduced Bratislava bridge-head to Czechoslovakia, but rejected Prague's demands for the expulsion of 200,000 Magyars. Delays in transferring the populations covered by the February agreement led to recriminations in the autumn, but the Prague Government accepted the Paris decision with good grace and by the end of December had apparently abandoned further efforts to expel the remaining Hungarian minority. The Czech-Polish quarrel over Teschen still defied settlement, though the war of the journalists on both sides of the border had diminished appreciably by autumn.

**Mother Russia.** The determination of the resurrected Republic to cast its fortunes with the Soviet Union was reflected in a variety of ways. The uranium mines near Karlsbad were reported in January to be under Russian control. Said Prime Minister Zdenek Fierlinger on March 10: "It is not true that my Government has turned its back on the West. Czechoslovakia has not turned her back on anybody, but she is looking for her safety to the Soviet Union." In mid-March a nationalization program went into effect, making State property of most of the country's industries in the fields of coal, power, steel, chemicals, pottery, porcelain, glass, rubber, textiles, paper, and leather, along with the Bata shoe factories. Despite Anglo-American refusal to approve the forcible repatriation of displaced Russians, Balts and Poles in Germany and Austria, Prague agreed to repatriate 40,000 refugees from Carpatho-Ukraine, now part of the U.S.S.R.

On May 9 Premier Fierlinger and Foreign Minister Jan Masaryk signed in Belgrade, amid great festivities and military demonstrations, a Czechoslovak-Yugoslav treaty of friendship and alliance. The completion of the Soviet alliance system in Central Europe through a comparable pact between Prague and Warsaw was not realized in 1946. But various agreements with Moscow on credits, trade and communications strengthened ties already made firmer by the results of the national elections. Government spokesmen deemed it necessary in November to deny reports that the armed forces of the Republic were under Soviet control. The weight of Czechoslovakia in the world balance of power, however, was unmistakably in the scales on the side of the Soviet Union.

**The Election of May 26.** On the last Sunday of May the voters went to the polls to elect a new Parlia-

ment. At Prague's request Marshal Ivan S. Konev agreed, three days before the balloting, to suspend the movement through Czechoslovakia of Russian troops leaving Austria for Germany. By all accounts the election campaign was conducted in an atmosphere of freedom and tolerance, with the results accurately reflecting popular preferences. The Communists, emerging as the largest single party, won 114 seats in the National Assembly and the Social Democrats 36. The National Social Party (Beneš) won 55 places, the Catholic People's Party 47, and the Slovak Democratic Party 41. The Communists received 40 percent of the total vote in Bohemia and Moravia while the conservative Democrats won 62 percent in Slovakia. Commented Fierlinger: "The masses realize that without the Communists, the Fascist forces would never have been defeated. There is no doubt that our great northern ally influenced the decision of many voters, even though it never mixed in our internal affairs." In the final count Communists and Socialists together controlled 152 seats as compared with 148 for the parties of the Center and Right.

In the new Cabinet, Social Democrat Fierlinger was replaced in the premiership by Communist Klement Gottwald, though the number of posts awarded to conservatives was somewhat increased as compared with the distribution in the Provisional Government. Dr. Eduard Beneš was elected to the presidency for the third time by unanimous vote of Parliament on June 19. Following a popular ovation, he took the oath of office from Antonín Zapotcký, Communist President of the Assembly.

**Toward a New Constitution.** In addressing Parliament on July 8 Premier Gottwald called for a new charter which would ratify the nationalization laws and "destroy the hopes for a return of private enterprise" in key industries, while protecting "private enterprise in small and middle-size business and all private property justly gained." He asked also for a 2-year economic plan; an "exclusive national State of Czechs and Slovaks" in which minorities would enjoy freedom and citizenship but be barred from voting and from active participation in government; and guarantees of free elections, women's rights, freedom of press, religion and assembly, an independent judiciary and rights to work, recreation and disability compensation.

A parliamentary commission of 36 members, appointed in November to draft the new constitution, was expected to take the better part of a year to complete its work. But two facts in the new balance of political forces were clearly established. One was that the Communists and their Socialist allies enjoyed the voluntary support of a majority of the electorate. The other was that the Left groups, while committed to socialization of large scale industry and finance with the approval of most Rightists, had no thought of introducing collectivism in agriculture and small business, nor of restricting personal freedom or democratic processes in the interest of perpetuating their own power or implementing any program of social revolution.

**The Wrath of Washington.** The nationalization statutes contemplated compensation to all former owners other than Germans, Hungarians and local collaborators and traitors. American-owned properties affected were variously estimated to be worth \$30,000,000 to \$50,000,000. Prague at all times conceded that compensation must be paid, but negotiations for payment were not completed during 1946. The State Department expressed its sharp opposition to the general course of Czechoslovak policies by revealing on October 16 the permanent suspension of the remaining \$40,000,000 of a \$50,-

000,000 credit extended in the spring for purchase of surplus United States army equipment in Europe and by asking the Export-Import Bank to suspend parleys for another credit of \$50,000,000 for equipment and raw materials for rehabilitation.

In the background of this action was the alleged lack of gratitude displayed by the Czechoslovak press for other aid, despite the assurances of Ambassador Juraj Slavik, who told President Truman in presenting his credentials on June 12 that his Government and people would "never forget what they owe" to America. The Washington decision was explained, albeit unofficially, by reference to a Czechoslovak accord with Rumania by which Prague had agreed to resell to Bucharest at a 7 percent profit some of the \$10,000,000 worth of surplus material purchased from the United States. Unfriendly references to "dollar imperialism" in the press were also cited among the factors influencing the decision, along with Czech support of Soviet policy at the Paris Peace Conference. It was not made clear either in Washington or by Ambassador Laurence Steinhardt in Prague whether the "freedom of the press" generally championed by the United States was to be interpreted as requiring a ban on criticism of American policies in Czechoslovak journals. Neither was it apparent how charges of "dollar diplomacy" could be refuted by withholding dollars from states where such charges were made.

**Left Turn.** The initial effect of the American action was to strengthen, rather than weaken, the anti-capitalist forces in Prague. A two-year plan of economic reconstruction and socialist industrialization became law on October 28 and went into effect on January 1, 1947. On October 31 Deputy Foreign Minister Vladimir Klementis asserted that the chief difficulty with Washington had been the American desire to include a clause in a trade agreement pledging both parties to membership in the proposed world trade organization—an obligation which Prague was unwilling to assume without assurances that the Soviet Union would also become a member. He denied that his Government had imputed political motives to the American offer of credits, but said that new steps would be taken to hasten compensation of expropriated foreign investors. On November 7 negotiations were concluded in London for a British credit of \$10,000,000 to Czechoslovakia.

On November 14 an exchange of notes in Washington between Ambassador Slavik and Dean Acheson effected an interim commercial accord by which Czechoslovakia reiterated its desire to contribute to the reduction of trade barriers and the elimination of discriminatory treatment; declared itself "in accord with the general tenor" of the American proposals for the expansion of world trade and employment; expressed its intention to abandon bilateral barter agreements and return to commercial multilateralism "at the earliest possible date"; granted reciprocal most-favored-nation treatment to the United States, pending the negotiation of a comprehensive trade treaty; renewed pledges of compensation for nationalized property; and agreed to keep the United States informed "concerning the international economic relations of Czechoslovakia." There was no indication that this accord would be followed by resumption of discussions of American credits. (Text in *The Department of State Bulletin*, December 1, 1946, pp. 1004-6)

Foreign Minister Jan Masaryk declared in an interview in Washington on December 2 that the Republic needed \$300,000,000 to restore its in-

dustry to a prewar level and would seek a loan from the International Bank. Europe, he said, is going Left and "only ostriches can't see that." He denied that there was any "iron curtain," added that he was "convinced" that no Third World War would break out soon, and expressed "contempt" for those anticipating a conflict. Through the U.N., he concluded, Czechoslovakia hoped to contribute to the solution of pending problems and the building of One World. Prague's part in the enterprise would plainly depend on the shape of things to come in the relations between Washington and Moscow. See GERMANY, HUNGARY, POLAND, U.S.S.R.

FREDERICK L. SCHUMAN.

**DAIRY INDUSTRY.** Bureau of. A Bureau of the U.S. Department of Agriculture, established as the Bureau of Dairying in 1924. It conducts investigations in the breeding and management of dairy cattle, in nutrition, and in the physiology of milk secretion and of reproduction. It also records the production of cows in dairy-herd-improvement associations for the purpose of identifying animals possessing an inheritance for transmitting superior milk- and butterfat-producing ability to their progeny. It develops sanitary methods of handling milk on the farm, in transit, and in dairy plants; and studies other factors affecting the wholesomeness and commercial value of milk. Chief: O. E. Reed. See AGRICULTURE.

**DAMS.** With the return of peace conditions, work has been resumed on a number of projects involving the construction of large dams, but progress has been checked and hampered by shortage of men and materials, by high prices and wages, and by government orders to defer the work to permit of concentrating construction on the housing emergency. Many dams for hydro-electric power development are built by utility concerns. Those for irrigation, flood control, and navigation or river improvement are built mainly by two government agencies—the Bureau of Reclamation, and the Corps of Engineers, U.S. Army (War Department). However, many of these dams serve also, more or less incidentally, for power development.

In a general classification there are earth dams and concrete dams; the former divided into earth and rock embankments, and the latter into arch, gravity and hollow dams. Stone masonry dams are rare. Research in the design of earth dams is being undertaken by the American Society of Civil Engineers, covering such matters as materials, foundations, pressures, drainage, seepage, protection from wave erosion, and improvements in methods of construction. In the examination of sites for dams, which are often difficult of access, extensive use is being made of aerial surveys.

A strikingly bold work now in progress is the increasing of the height of the concrete-arch Ross dam of the municipal power system of Seattle, Washington. From its original height of 290 feet, it is being raised to 545 feet without enlargement of its base. But with such reinforcement it is to be extended to an ultimate height of 675 feet. Other examples of typical private projects may be noted: on the San Jacinto River to create a reservoir for domestic and industrial water supply at Houston, Texas; an earth embankment 7,700 ft. long, including 1,300 ft. of concrete spillway, with steel control gates. On the Wisconsin River for power and flood control; water from the reservoir in flood times to be pumped by screw pumps with a

lift of 25 ft. to a reservoir on the Little Eau Plaine River, near Wausau, Wis. On the Potomac River, near Cumberland, Md.; here the Savage dam, begun in 1939, was halted in 1943, but is now urged for completion as an aid to checking the pollution of the upper Potomac; it is to be an earth dam, 175 ft. high. The Neversink dam is under construction as a part of the new Delaware River water supply for the city of New York.

Of numerous projects for dams by the U.S. Bureau of Reclamation, eight were under way in 1946: (1) Anderson Ranch dam on the south fork of the Boise River, Idaho; halted in 1943 and to be completed in 1948; the highest embankment dam in the world, 444 ft. (2) Angostura dam, on the Cheyenne River, South Dakota; concrete gravity structure 150 ft. high. (3) Cascade dam, on north fork of the Payette River, Idaho; earth and rock fill, 90 ft. high. (4) Davis dam on the Colorado River, Arizona; earth and rock fill, 138 ft. high; to be completed in 1948. (5) Horsetooth dam, near Fort Collins, Colo., forming a reservoir to receive water coming through the 13-mile Continental Divide tunnel from the Pacific slope. (6) Granby dam, 232 ft. high, for a collecting reservoir at west end of tunnel. (7) Kortes dam, on North Platte River, Wyoming; concrete gravity dam, 200 ft. high. (8) South Coulee dam, supplementing the Grand Coulee dam on the Columbia River in Washington. A series of dams has been proposed along the Columbia and Snake rivers, but is opposed by fishery interests, for the reservoirs would destroy large areas of fish-spawning grounds.

Many flood-protection dams built by the Corps of Engineers, U.S. Army, will form reservoirs that may serve for power development, stream-flow regulation, and other purposes. Projects renewed after the war include Susquehanna River dams, Pennsylvania; Garrison dam on the Missouri, North Dakota; John Martin dam, Colorado; Canton dam, Oklahoma, and many others forming parts of extensive systems. Among the eastern works is the Genesee River dam, near Mount Morris, N.Y.

In foreign fields there are many important works and projects. A concrete dam on the Sutlej River, in India, for irrigation and power purposes, is being designed by American engineers. It is in the Punjab province, some 100 miles south of Lahore. For the work of increasing the height of the stone masonry Aswan dam, on the Nile, bids have been invited from the United States, Great Britain, Sweden, and Switzerland. It serves now for flood control and irrigation, but the increase in height is to be accompanied by power development. A proposed dam for power and irrigation on the outlet of Lake Tana, in Ethiopia, has international aspects, and is planned by American engineers. An earlier project has been proposed by British interests, since it would control the headwaters of the Blue Nile, for the Italian invasion a few years ago became a threat to control of the flow of the Nile.

In China, a dam is being built to force the unruly Yellow River to return to its normal channel running northeast to the sea. The government has also had plans prepared by the U.S. Bureau of Reclamation for a dam on the Yangtze River as part of a vast project for irrigation, power, flood control, and inland navigation.

In Argentina, an 80-ft. concrete dam for irrigation and power is being built on the Atuel River, which has a fall of 2,000 feet in a 25-mile canyon. For the water supply of Caracas, Vene-

zuela, engineers and contractors from the United States are building a series of three dams. In Alberta, Canada, the St. Mary's earth dam for irrigation is under construction near Spring Coulee, and also a power dam 130 ft. high on the Kananaskis River. Two concrete dams are being built on the Dordogne River, France, and its tributary the Cere River; they are peculiar in that the spillway is in the middle and over the roof of the power house. A power and irrigation project on the Rhone is served by the Genesiat dam, 130 ft. high, with locks for navigation. France is also building dams for power purposes in Algeria, and Switzerland plans a dam 675 ft. high in the Alps, near Andermatt, also for power. The U.S. Army (in occupation) has approved the construction of the concrete Kaprun dam, 393 ft. high, in the Austrian Alps. Russia is reported as having a number of dams in its five-year plan, and also an earth dam 185 ft. high on the Chu River, in Central Asia, for irrigation in the Kirghiz district, where earthquakes are of frequent occurrence. See AQUEDUCTS, WATER SUPPLY.

E. E. RUSSELL TRATMAN.

**DANISH ARTS AND CRAFTS.** The renaissance in the style of Danish arts and crafts, coming toward the close of last century, which has since won world recognition for Danish industrial arts is largely identified with names such as Arnold Krog of the Royal Danish Porcelain Works; the Bing and Gröndahl porcelains; Georg Jensen silver; Anker Kyster, bookbindings; F. Henriksen, graphic arts; Johan Rohde and others. It inspired crafts in many other fields. Renowned is the ceramic ware of Herman A. Kähler and L. Hjorth; the pewter and bronzes of Just Andersen; the stoneware of Nathalie Krebs. Best known among the artists associated with the two porcelain works are Knud Kyhn, Jais Nielsen, Alex Salto (Royal Copenhagen), and Jean Gauguin, Ebbe Sadolin and Cathinka Olsen. (Bing and Gröndahl)

Among silversmiths, besides the Georg Jensen establishment, are the workshops of A. Michaelson, Kay Bojesen, and Frantz Hingelberg of Aarhus. Hand weaving, prints, leather goods, and the Kay Bojesen toys deserve mention. Among creators of new Danish furniture are Kaare Klint, Ole Wanscher, Moelgaard-Nielsen, Kindt-Larsen, Rigmor Andersen, and Mogens Koch. Interest has been stirred also by new designs in wallpapers and hand decorated papers for book covers.

Active in encouraging Danish industrial arts is the National Society of Crafts and Industrial Arts.

C. H. W. HASSELRITIS.

**DEFENSE TRANSPORTATION, Office of (ODT).** The Office of Defense Transportation entered the year 1946 with its controls over the nation's transportation operations largely limited to waterway and rail transportation services. Motor trucking, local transit, taxicab, pipeline and liquid transport controls were lifted in rapid succession following V-J Day. A number of railroad and waterways restrictions were also revoked or modified before the year began.

Shortages of rail equipment, motive power, passenger coaches and sleeping cars, freight cars, particularly box cars, and continuing heavy traffic, both passenger and freight, necessitated the continuance of a number of controls over rail transportation.

The movement of troops returning from the European and Pacific fronts reached its peak at the turn of the year. Early in January demand for troop

transportation began to decline as did the heavily accelerated wartime travel of civilians, business men, war plant workers, relatives, and friends of service men and women.

On January 8, the ODT relinquished possession and control of the Capital Transit Company of Washington, D.C., the operation of the lines—taken over in November 1945 following a labor dispute—being the last holdover activity of the former ODT Highway Transport Department.

As soon as rail passenger traffic showed signs of easing, the ODT moved to modify or revoke its wartime passenger traffic regulations. The completion and delivery of 800 new troop sleepers and reductions in the movement of troops from West Coast ports of arrival made possible the revocation, late in January, of the orders which set minimum average speeds for the operation of troop trains and allocated airplane space from the West Coast to returning troops.

As of February 15, the 450 mile limitation on sleeping car runs was eased by reducing the mileage limitation to 350 miles. A further reduction to 250 miles was made, effective March 1. The order was revoked March 15. The time limit on Pullman reservations was also revoked as of March 15.

Developments during February and March—a strike of 3,500 tugboat workers in New York Harbor, shortages of box cars for the movement of export grain and foodstuffs, and shortages of box, refrigerator, and coal cars—were events presaging the chief ODT transportation problems to be coped with in the first postwar year.

On February 6, the ODT assumed possession and control of 91 towboat companies operating in New York Harbor and contiguous waters. Laurence C. Turner, Director of ODT's Waterway Transport Department was named Federal Manager of the properties. Following the signing of an arbitration agreement, the properties were returned to private control, March 3.

To expedite the movement of grain and foodstuffs for export relief, the ODT late in February and in March requested the Interstate Commerce Commission to issue service orders: requiring carriers to give preference in furnishing cars to certified shippers of food for export relief and to give priority to country grain elevators on orders for empty cars, and appointing an agent to pool empty box cars for the transportation of foodstuffs for overseas relief. These orders were suspended or revoked later in the spring as the movement of export foodstuffs improved.

Early in March, Col. J. Monroe Johnson, ODT director, made the first of a number of appeals to railroad executives to take action to relieve the box car and freight equipment shortage and to improve the efficient use of such equipment. During the month, he called upon the railroads to reduce the number of bad order cars, to cut turn around time down to 13 days or less, to improve the efficiency of their operations with respect to increasing car supply, to set a goal for the repair and rehabilitation of locomotives, to speed up the completion and delivery of railroad cars on order, and to increase their orders for additional cars. He predicted that carloadings would continue to rise.

On May 1, the ODT revoked its two remaining orders regulating railroad passenger traffic, General Orders ODT 55, which had placed all railroad passenger day coaches, baggage and express cars at the disposal of the military authorities under ODT supervision, and ODT 56, which had established uniform occupancy standards for railroad cars in organized military movements.

In order to conserve railroad coal supplies during the 59-day bituminous coal strike, the ODT, early in May, reduced coal burning passenger locomotive service by 25 percent as of May 10 and by 50 percent as of May 15. At the same time the ODT issued a directive to the Association of American Railroads embargoing all rail freight with the exception of commodities and supplies necessary to public health and safety, such as food, fuel, animal feed, medical supplies, and printing paper and ink. Railway express shipments were later embargoed. Motor carriers were also ordered to give preference to the movement of essential commodities.

In anticipation of a strike of railroad employees, the ODT was ordered by the President to assume possession and control of the nation's 337 rail carriers on May 17. Charles H. Buford, executive vice president of the Chicago, Milwaukee, St. Paul & Pacific Railroad Co., was named Federal Manager of the properties.

The ODT moved swiftly to forestall a breakdown in the transportation of essential public needs. Conferences were held with representatives of the airlines, water carriers, highway carriers, the Army, Navy, and the Interstate Commerce Commission to formulate plans for the utilization of non-rail transportation in the event of a stoppage of rail transportation. A number of former ODT officials in various transportation fields were recalled to aid in maintaining the movement of essential supplies.

Following the stoppage of rail service, the ODT on May 23 issued a series of orders coordinating the use of air, highway, and water transportation services. Preference lists of essential commodities were established for each type of carrier, joint action and equipment and service pooling arrangements were authorized, and ODT officials were named to administer the emergency transportation measures.

Aiding the ODT in its effort to mobilize emergency transportation service were various advisory committees representing their respective transportation industries and representatives of other government agencies including the Army, Navy, Maritime Commission, War Shipping Administration, Civil Aeronautics Board, Air Transport Command, Naval Air Transport Service and the Interstate Commerce Commission.

A complete and integrated organization was directing transportation of essential needs when the strike was called off on May 24. The emergency measures were rescinded shortly thereafter, possession and control of the railroads being relinquished as of 4 p.m., May 26. At the same time the ODT relinquished possession and control of the Illinois Central Railroad which had been under government control as a result of a labor dispute since August 23, 1945.

The ODT assumed possession and control of the Monongahela Connecting Railroad Co., on June 14, following a labor dispute. The line was returned to private operation August 12 upon settlement of the differences.

Although the ODT was scheduled to liquidate its activities at the close of the fiscal year, June 30, shortages of railroad freight equipment, continued increases in freight traffic, and ODT operation of several transportation services involved in labor disputes resulted in Congressional authorization for continuance of the agency until April 30, 1947.

Freight car loadings, particularly box cars and coal cars, continued to rise during June and by mid-July, loadings were above their wartime peaks. To meet the demand for box cars in the grain grow-

ing regions, the Interstate Commerce Commission at the request of the ODT ordered the movement of 1,000 empty box cars per day into the Central, Western, and Southwestern regions.

To increase the efficient utilization of available box cars and coal cars, the ODT urged receivers of freight to provide for Saturday loading and unloading. The railroads were also called upon to speed up the movement of equipment and to step up the repair of bad order cars, the number of cars in need of repair being twice as large as during the war years.

As claimant agency for the transportation industry, the ODT worked with the Civilian Production Administration to channel needed items of steel to the railroads and car builders both for repair and the building of new equipment. Efforts were also made to bring about price adjustments in certain lumber items through the Office of Price Administration.

To reduce the detention of coal cars, penalty demurrage charges were imposed as of August 1 in an ICC Service Order issued at ODT request. Coal receivers were also asked to provide for Saturday unloading for loading within the allotted free time. In an effort to increase heavier loading of freight cars, the ODT revised and reissued its less than carload and carload freight orders, General Orders ODT 1, Revised, and 18A Revised, effective August 11. Through arrangements made with the Interstate Commerce Commission, service agents of the ICC Bureau of Service were assigned the task of isolating and reporting non-compliance with ODT orders and of obtaining efficient and maximum utilization of railroad facilities.

Additional appeals were made to shippers and receivers of freight to speed up the loading and unloading of freight cars and the railroads were called upon to reduce the number of bad order cars and increase their orders for new equipment. The appeals resulted in a steady improvement in turn around time and continued reductions in the number of bad order cars during the late summer and fall months. Turn around time decreased from 14.4 days in June to 13.0 days in October. Bad order cars declined from 82,000 in July to 73,000 in November.

As predicted by Colonel Johnson early in the spring, freight car loadings during October and November reached record highs, surpassing the highest loadings since 1930. For the five weeks prior to November 16, loadings were running at an average of 925,000 a week, a figure considerably above wartime levels.

Several days before the year's second stoppage of bituminous mining operations, the ODT ordered a 25 percent reduction in railroad passenger service performed by coal burning locomotives, effective 11:59 p.m. November 24. On December 3, after the strike had been in effect for about two weeks, the ODT took four restrictive measures to conserve the Nation's remaining stockpiles of railroad bituminous coal as follows:

1. Requested the Interstate Commerce Commission to embargo all rail freight and express shipments except certain commodities and supplies necessary to the maintenance of public health and safety. The embargo action (ICC Service Order No. 649) was to be effective at 12:01 a.m., Friday, December 6.
2. Effective 11:59 p.m., Sunday, December 8, increased the recently ordered 25 percent reduction in railroad passenger mileage performed by coal burning locomotives to 50 percent.

3. Requested Postmaster General Robert E. Hannegan to adopt, as of 12:01 a.m., Friday, December 6, such regulations as may be deemed advisable and appropriate to restrict and reduce the amount of United States mail, including parcel post, that may be tendered to the railroads during the present emergency.

4. Subjected all export shipments except bulk grain, livestock, and exports for the armed services to shipment under special permit, effective 12:01 a.m., Wednesday, December 4.

In addition the ODT made plans to reinstate the emergency organization setup to direct transportation of essential needs at the time of the railroad strike in May.

On December 7, following the announcement that soft coal mining operations would be resumed the ODT acted immediately December 9 to restore normal rail passenger, domestic and export freight, express and parcel post services.

J. M. JOHNSON.

**DENMARK.** A kingdom of northwestern Europe, comprising the peninsula of Jutland, the two main islands of Zealand and Fyn, and about 200 smaller adjacent islands in the Baltic. Denmark was occupied by German armed forces from April 9, 1940, until May 5, 1945. The Faeroe Islands (q.v.) an integral part of the kingdom, were occupied by British troops on April 13, 1940, for the duration of the war. Greenland (q.v.), a Danish dependency, remained under the control of the local Danish administration but accepted United States protection for the duration of the conflict. The King of Denmark was King of Iceland (q.v.) until June 17, 1944, when the independent Republic of Iceland was established. Capital of Denmark, Copenhagen. King, Christian X, who succeeded to the throne May 14, 1912.

**Area and Population.** Total area excluding the outlying possessions, 16,575 square miles. Estimated population, January 1, 1945, 4,024,000, as compared with 3,844,000 at the census of November 5, 1940. The live birth rate per 1,000 inhabitants was 21.3 in 1943 (20.9 in 1942); death rate, 9.6 (9.6). There were 37,524 marriages in 1944. Populations of the chief cities (1940 estimate): Copenhagen 890,130, Aarhus 99,881, Odense 85,521, Aalborg 55,621.

**Education and Religion.** There is no illiteracy. The elementary schools had 455,990 pupils in 1944; secondary and middle schools 67,064; the two universities had 6,474 students enrolled. The 1921 census showed 3,221,843 Protestants, 22,137 Roman Catholics, 5,947 Jews, and 17,349 others.

**Government.** The Constitution of June 5, 1915, as amended Sept. 10, 1920, vests executive power in the King acting through a cabinet responsible to the Rigsdag (Parliament). Legislative power rests jointly in the King and Rigsdag. The Folketing (lower chamber of the Rigsdag) consists of 149 members elected for four years by proportional representation. The Landsting (upper chamber) comprises 76 members serving for eight years; its powers are very limited. Prime Minister: Knud Kristensen (appointed November 8, 1945).

**Events, 1946.** On the home front, the year was relatively uneventful, but territorial problems, trade relations, and an uneasy realization of being once again placed at the intersection of two great power orbits kept Denmark in suspense. All of the country's remaining overseas possessions—Bornholm, the Faeroes, and Greenland—made news during the year. The South Schleswig question remained in the center of national interest.

**The Homefront: From Unrest to Tranquillity.** At the start of the year, the after-effects of the war and of the Nazi occupation were still felt in many respects. Widespread economic dislocation persisted, the animosity against Nazis and collaborators had not subsided, and, above all, the spirit of violence which the hazardous life of the underground had bred in the once peaceful and orderly country was still rife.

A marked political tension, which had begun to manifest itself in December 1945, persisted through January and February. Its primary cause was popular dissatisfaction with the slow pace of the purge and the leniency shown by the courts towards traitors and collaborators. The former Resistance threatened to take matters into its own hands. Wild-cat strikes, bomb outrages, and even a few political murders were used to register this protest.

The Agrarian, and on the whole conservative, government of Premier Knud Kristensen laid these terrorist outbreaks mostly at the door of the Communists. In an angry speech at Esbjerg on January 14, Mr. Kristensen declared: "I am not going to bow before the Communist wind that now blows through the country . . . Law and order must prevail, and just as we did not tolerate Nazi methods, we won't let ourselves be dictated to by the Communists, at least not while I am in power."

This statement was followed by a series of strikes which for a while threatened to throw the country into a state of open anarchy. The tension was climaxed by a two-day general strike that broke out in Copenhagen on February 9, accompanied by turbulent street demonstrations. The immediate cause of this action was the commutation by a superior court of a death sentence imposed on a Nazi informer, Oluf Klagenberg.

The strike, and concomitant disturbances, were brought to a halt through the intervention of the powerful trade unions and the Social-Democratic party, which blamed the whole action on "unknown and irresponsible circles."

Thereafter the agitation subsided gradually, especially after the communal elections of March 12 had permitted voters to let off a little steam. The results of the poll were, by and large, in line with those of the general election of October 30, 1945, at which the Social-Democrats had lost heavily to the Communists, and the Agrarian party had made corresponding inroads on the strength of the Right. In spite of the Communists' gains in absolute figures, however, they showed considerably less strength than at the Folketing election, especially in Copenhagen.

In the following months, public interest was increasingly distracted from the political strife at home by important developments in the Danish possessions abroad and in the Jutland border question.

**The Russians Leave Bornholm.** Ever since the end of hostilities in Europe, the continued yet obviously unnecessary presence of strong Soviet forces on the Danish island of Bornholm, situated in the center of the Baltic, had been an irritant in international relations. While the Russian troops on the island behaved with extreme reserve and courtesy, and there were no incidents between them and the local population, there were persistent rumors of Soviet designs of annexation. The Danish Government was worried, but said nothing in public; the Swedish Government was perhaps even more concerned because of Bornholm's nearness to the mainland of Sweden. In the House of Parliament in London, the question was raised repeatedly, why were the Russians staying on the Danish island, and what did

the government of Britain propose to do about it.

Wisely, the British refrained from prodding the Russians in the matter. On January 28, Philip J. Noel-Baker, Minister of State, informed the House of Commons that the Government did not intend to bring the Bornholm question up before the United Nations Security Council, but considered it to be "a matter for direct settlement between the Governments of Denmark and the Soviet Union."

Shortly thereafter, negotiations between the two governments got under way and progressed smoothly. The Russians posed in effect only one condition for their withdrawal: that the island be garrisoned by Danish troops and effectively guarded against a new attempt at foreign occupation. The Danes, who before 1939 had badly neglected their national defenses, agreed to mend their ways in this respect.

On March 7 the first intimation of an imminent Russian evacuation was received in Copenhagen. The news was greeted with unconcealed joy by the Government, as well as the public. A few days later the first troop withdrawals began and by April 5 the last Russian soldier had left the island. Even before the evacuation was completed, the first Danish troops arrived, and indications were that Bornholm in the future would be strongly held and perhaps fortified by the Danes.

**Denmark, Greenland, and the United States of America.** Meanwhile, the question of Greenland's future status and of the American bases on that island had also become the subject of lively speculation, both in Denmark and abroad. Negotiations in the matter proceeded under a cloak of secrecy apparently imposed for American security reasons.

A Greenland delegation of six arrived in Copenhagen on December 21, 1945 for talks with Premier Kristensen. The spokesman of the group pointed out that the Greenlanders did not seek independence but merely an extension of self-government, while maintaining close relations with Denmark. On March 28, it was announced in Copenhagen that the Danish Admiralty had decided immediately to set up a separate naval command at Godthaab on the west coast of Greenland, and that a coast guard cruiser would be dispatched there shortly.

On May 29, the Soviet news agency TASS reported from Copenhagen the arrival, in that city, of an American military mission from Greenland. According to TASS, the Americans were intent on retaining their military installations on Greenland. The arrival of the United States mission in Copenhagen coincided with a visit to Moscow by the Danish Foreign Minister Gustav Rasmussen.

On October 30, Mr. Rasmussen informed the Folketing that the Danish Government was considering termination of the wartime agreement with the United States under which American military and naval forces were established in Greenland. He added that a clause in the agreement provided for its termination, when "the peace and security of the American continent was no longer endangered," and that he supposed this was now the case.

**The Faeroe Islands Seek Independence.** Still another Danish dependency, the Faeroe Islands group north of Scotland, became a source of worry and excitement for the Danes. At the end of the war, the Faeroes, which had been occupied by the British on April 11, 1940, two days after the German invasion of Denmark, had been restored to Danish sovereignty, with only a few British troops remaining on the islands. During the long period of enforced separation from Denmark, however, a strong independence movement had developed in the

Faeroes, spearheaded by the *Folkeflokkur* or People's party. At the 1943 elections, this party had taken a strong lead over its two rivals, the *Samband* party, which favored continued union with Denmark, and the Social-Democrats, who were split on the issue of independence.

After the postwar negotiations with Denmark had reached an impasse, the Faeroe Lagting (assembly) resolved in June 1946 to submit the question of independence to a plebiscite, which was held on September 15. The vote was one of the closest ever recorded for a popular referendum of this type. While 5,660 Faeroese cast their ballots in favor of an independent republic, 5,500 expressed a desire to remain Danish subjects; the remainder of the ballots, 480, were declared invalid. On September 19, Thorstein Petersen, leader of the People's party and speaker of the Lagting, proclaimed the Faeroes' independence, and four days later the Assembly ratified this act by a vote of 12 to 11.

The Danish Government, however, declared that the ballot had been inconclusive and denounced Petersen's action as a "coup d'état." On September 24, King Christian dissolved the Lagting and ordered the election of a new assembly on November 8. After the poll, which gave the partisans of continued union with Denmark a slight plurality, a parliamentary delegation from the Faeroes was invited to Copenhagen for further discussions about the future status of the islands.

**The South Schleswig Problem.** The question, however, which more than any other, preoccupied Danish minds during the year was that of the Danish minority in the German province of South Schleswig. (see 1946 YEAR BOOK)

The Danes were particularly concerned over two developments, both of which tended to prejudice the minority's position in South Schleswig. One was the continuing influx of German refugees and deportees from the East; by mid-summer, about 500,000 of these newcomers had been resettled in the province, with many more to come. This mass migration not only reduced the Danish minority in South Schleswig to insignificance, but caused even the local German population to be outnumbered by a new Prussian element of altogether different mentality and traditions. Thereby arose new pressures and new frictions which the Danish Government regarded as a potential threat not only to the Danish minority south of the border, but also to Denmark's own territorial integrity and security.

The other unfavorable development was the formation in mid-September of the new German *Land* of Schleswig-Holstein, in the course of the territorial regroupment carried out by the British military authorities in their zone of occupation in Germany. As a result of this reform, Schleswig with its mixed population was tied administratively even closer to Holstein with its purely German population, thus further diminishing the importance of the Danish element in the border districts.

Since both these developments occurred with the full knowledge and approval of the British Military Government, and over the repeated protests of the Danish Government, a growing tension between London and Copenhagen was the natural result.

After a lengthy and at times rather stormy debate of the matter, the Folketing on July 9 adopted a resolution supporting the Government's stand and urging continued negotiations with the British with a view to: (1) safeguarding the rights of the Danish minority in South Schleswig; (2) obtaining the removal of the immigrants from Eastern Germany; and (3) ensuring Danish participation in

any final settlement affecting Denmark's national interests.

On August 9 Foreign Minister Rasmussen left for Schleswig-Holstein to study the minority's plight at first hand, and to confer with the British military authorities. He was given a friendly reception by the British, but failed to come to an agreement with them, and he was also unable to prevent the establishment of the state of Schleswig-Holstein, which occurred shortly thereafter.

In reply to renewed Danish representations, the British Chargé d'affaires in Copenhagen on September 9 delivered a note, which the Danish press characterized as "unusually sharp." In it the British Government demanded that Denmark cease to interfere, directly or indirectly, with the affairs of South Schleswig. At the same time, however, the British declared their willingness to take Danish proposals for an exchange of population, a plebiscite, or a frontier revision without plebiscite, under advisement.

The British note gave rise to a new lively debate in the Folketing, which did not fully share the Government's views in the matter and came close to overthrowing it. As a result the Danish reply, which was made public on October 21 was conciliatory and did not insist on a plebiscite or on submitting the dispute to the United Nations, as the Government had originally planned. The note did, however, reiterate the Danish Government's wish for an administrative division between Schleswig and Holstein, and for a voice in the German peace settlement insofar as it would affect Danish interests. A new attempt to overthrow the Government on the South Schleswig issue was defeated in the Folketing on December 5, by a vote of 74 to 19, with 48 abstentions.

The problem of the German refugees in Denmark also remained unsettled. With more than 200,000 German nationals still on Danish soil, the Copenhagen Government in August appealed to the Allied Control Council for their removal. The Russian representative on the Council expressed willingness to receive half of the refugees in the Soviet zone, if the western powers accepted responsibility for the rest. The British, however, balked at taking more than 12,000 into their already badly overcrowded zone. Repatriation of this limited number began on November 1, but the chances that Denmark, before the end of the year, could rid itself of the remaining Germans were slight.

**Economic Affairs.** The economic situation in Denmark continued to improve steadily, with both industrial and agricultural production at high levels toward the end of the year. Many food items, including butter, remained rationed not because they were in short supply, but because so much food was being shipped abroad, especially to Britain, that home consumption had to be limited, though rations were ample.

Important trade agreements were concluded with Russia in July, with Great Britain in August, and with Poland in October. The terms of the treaty with Russia were not made public, but the agreement with Britain provided for shipment to that country until October 1949 of about 90 percent of Denmark's surplus butter and bacon and practically all eggs. The trade pact with Poland assured Denmark of substantial and increasing deliveries of much-needed coal, beginning with 1,300,000 tons in the first year. Denmark, on the other hand, promised to supply Poland with 45,000 horses, mostly on credit.

In August the Government was authorized by

the Folketing to take up a loan of \$50,000,000 from the United States Import and Export Bank, for the purchase of American cars, trucks, tractors, chemicals and raw materials, mainly.

Denmark's greatest economic difficulty in 1946 was a marked shortage of foreign exchange. In spite of the heavy deliveries of agricultural produce to Britain, Denmark's indebtedness to that country exceeded 400,000,000 kroner in September.

In the first days of September, the second general conference of the United Nations Food and Agricultural Organization (FAO) was held in Copenhagen, with delegates from 42 countries attending it. It was the greatest international congress ever held in Denmark.

**Production.** Denmark is essentially a land of intensive dairy farming. Industry, however, is also important, despite an almost complete lack of minerals and water power. Shipbuilding, in particular, is a leading Danish industry. Before the war 35 percent of the working population was employed in agriculture and dairying and 33 percent in industry. Commerce and fishing were the other important occupations. It was estimated in July, 1945, that Denmark at the end of the German occupation still possessed the following percentages of its prewar livestock: horned cattle, 97 percent; pigs, 52; poultry, 54; horses, 106.

Principal crop production, in 1,000 metric tons, in 1945 included: root crops, 21,390; potatoes, 1,620; barley, 1,250; oats, 990; mixed grain, 740; rye, 320; wheat, 280. In 1944 the total value of fish caught was 150 million kroner.

**Foreign Trade.** In 1944 the total value of imports was estimated at 1,167,600,000 crowns; exports, 1,347,600,000 crowns. As in previous years during the occupation, Germany accounted for about 70 percent of Denmark's foreign commerce both on the import and export side. Germany's accumulated debt on clearing account totalled 2,692,000,000 crowns on Sept. 30, 1944, not including occupation costs.

**Finance.** The 1945-46 budget estimates included current revenue 968,865,000 kroner and current expenditure 1,112,317,000 kroner. On March 31, 1945, the public debt amounted to 1,233,990,000 kroner.

JOACHIM JOESTEN.

**DENTISTRY.** The year 1946 brought little change in the overall picture. Shortages of office space and of equipment delayed the resumption of practice by those released from service, or by those who had completed their refresher courses. There is no immediate relief visible to meet the critical shortage of dentists and the demands for their services. Social and economic problems are even more pressing than they were a year ago and but little nearer a solution. Just as after World War I, both returned veterans and civilian practitioners are deeply interested in specialization of the practice of dentistry; there is a progressive tendency toward specialization, even over-specialization. For the first time in over a decade, dental schools have long waiting lists of prospective students. Both books and periodicals are returning, though slowly, to a peacetime status.

**Organized Dentistry.** The meeting of the American Dental Association was limited to the sessions of the House of Delegates and the outstanding committees of the Association. Plans were made for a full-scale meeting of the Association in Boston in August of 1947, a meeting which will have an international character because of the participation in it of the *Fédération Dentaire Internationale*.

Additional boards for the certification of dental specialists are in the process of formation. The board for oral surgery proposes to hold its first examination in 1947. Prosthetics is well on the way and one or more additional boards are contemplated. Dental practice, therefore, is following quite exactly the example of medicine.

**Armed Services.** The effort to create separate and independent dental organizations in the Army and Navy failed in the case of the former, but considerable progress has been made in the Navy. A Naval Division for Dentistry has been created within the Bureau for Medicine and Dentistry, and all functions of a dental nature are to be referred to the Dental Division. The demobilization of dentists from both services has proceeded at a rate comparable with that of other groups.

**Dental Education.** Although schools have been overwhelmed by the demand for refresher and graduate courses, they have been able to accommodate only a fraction of the applicants because of serious shortages of space, teachers, and equipment. The Kellogg Foundation made substantial money gifts to a number of dental schools giving short courses for demobilized dentists. Undergraduate registration in the first year of dentistry has taxed all facilities to their limit, but the three upper classes are far from crowded. Practically all of the schools have returned to a normal program without acceleration. The total first year registrations in all United States dental schools, as of October 15, 1944 was 2,496; as of October 15, 1945, 1,197; and as of October, 1946 definitely in excess of the 1944 figure of 2,496. This represents a situation of a freshman class about as large or larger than the rest of the school (three classes). The students of 1944 entered under the accelerated program as did those of the preceding war years, so that the bulk of the upper classes of the 1946-1947 school year is made up of the small 1945 entering group, and what is left of the accelerated students of the preceding two years or less. The University of Washington opened the doors of the new dental school at Seattle, at the beginning of the current school year. There are no other changes in the number or status of the dental schools in the United States.

**Dental Public Health.** The large demonstrations in the mass control of dental decay by the method of fluorinization of the public water supplies in single communities in each of the states of New York, Michigan, and Illinois are being pushed vigorously and efficiently. Careful records are being made now of the examinations made before the water is treated in order that eventually the effects of the projects may be determined with exactness. A similar plan has been announced by the Texas Health Department to be carried out in Marshall, Texas. A control community has been paired with Marshall, and before and after examinations are proposed. Because of statements in both professional and lay periodicals with reference to the marked absence of dental decay in Deaf Smith County, Texas, it is of great interest that the Texas Health Department has made the following commitment: "We are now renewing our study of Deaf Smith County, where, of course, fluorine-bearing water is a factor; but where we maintain that fluorine is not the only factor in the extremely low dental caries rate." It seems very clear that mass prevention of dental disorders can contribute more to the solution of how to provide for adequate dental care than any other single proposal; indeed a large part of current dental research has this objective.

**Book and Periodical Literature.** Book production, at the beginning of the year, was at a new ebb, but the year has supplied a small number of significant volumes, and an increase is quite apparent. One of these is *Teaching in Colleges and Universities (with Special Reference to Dentistry)*, by Blauch and his Associates; it is published by the American Association of Dental Schools. This is a valuable contribution of a profession, in an attempt to criticize, evaluate, and standardize its own educational program in which it has the assistance of professional educators. A second book by John A. Kolmer on penicillin (*Penicillin Therapy, Including Tyrothricin and Other Antibiotic Therapy*), published by Appleton is mentioned, although the text content directly applying to dentistry is relatively small. However the review of the periodical literature indicated a high interest in penicillin therapy, a topic receiving greater attention than any other single item, 17 out of the 277 articles that were selected as worthy of review. Penicillin is not only of value in the treatment of dental infections but seems to be of even greater service in the prevention of some of the very serious involvements of the body associated with tooth extractions. On the basis of the abstract service supplied by two dental journals and the selection of the articles to be abstracted, the subjects of major interest have to do with surgery and anesthesia, social and economic implications of the practice of dentistry, and the relations between dental disease and disease elsewhere in the body. Restorative dentistry is generously represented as is also research; the latter is rather unusual. Except as previously noted there is little that is new, the articles are either critical in character or have to do with minor improvements or modifications of treatment and techniques that are standard. Sixty-five percent of the 277 items previously noted were found in dental journals, 28 percent in medical periodicals; and the remainder, seven percent, were found in scientific or non-professional magazines. Of the 277, 86 percent were taken from North American periodicals; and the remainder were foreign in origin, chiefly British or its Dominions.

EDWARD H. HATTON.

**DISCIPLES OF CHRIST**, a communion known also as the Churches of Christ and Christian Churches, sprung from a movement for Christian unity, which arose in American Presbyterian circles at the beginning of the 19th century, under Barton W. Stone, in Kentucky, and Thomas and Alexander Campbell in Western Pennsylvania. This is the largest religious body having its origin in America. It was fifth among Protestant communions in the United States in 1946. In policy the churches are congregational. There are six major agencies of the communion. The United Christian Missionary Society; Board of Higher Education; Association for the Promotion of Christian Unity; Pension Fund; National Benevolent Association; Board of Church Extensions; besides the missionary societies of the several states and provinces of Canada. These agencies are corporations and are affiliated with the International Convention of Disciples of Christ which meets annually. The general missionary work, both home and foreign, of the churches is administered through The United Christian Missionary Society, with headquarters at 222 Downey Avenue, Indianapolis, Indiana. Its board of managers of 120 is composed of sixty men and sixty women. The foreign missionary work in 1946 embraced: the Belgian Congo in Africa, China, India, Jamaica, Japan, Mexico, Philippine Islands, Puerto

Rico, Argentina, Paraguay and Batang, on the border of Tibet. However, the work in Japan, suspended during the war, has not yet been resumed.

Statistics of the communion show that during the year there were 5,086 baptisms in the foreign fields. The 355 mission schools had a total enrollment of 13,739. The communion maintained 9 hospitals and 16 dispensaries which gave 596,806 treatments. The Church Extension Fund amounted to \$3,133,372.00 with outstanding loans to 214 churches. The Pension Fund for the ministry showed assets of \$5,455,454.00. One hundred twenty-four young people's conferences were held. Work in America was conducted among the French, Highlanders, European immigrants, Negroes, Orientals, Spanish-Americans and Mexicans. The National Benevolent Association maintained six homes for children, and an equal number of homes for the aged. In 1946, 25 Colleges, Universities, Bible Colleges and Foundations cooperated with the Board of Higher Education.

The total church membership throughout the world in 1945 was 1,943,441; and in the United States and Canada 1,776,878. The Bible school enrollment for the world was 1,113,478, and for the United States and Canada, 1,013,879. Contributions, missionary, benevolence and educational, reported for the fiscal year 1945, in the United States and Canada totaled \$8,759,872.65.

Among the periodicals published by the communion are *World Call*, *The Christian-Evangelist*, *Christian Standard*, and *Front Rank*. The president of the International Convention which was held in August in Columbus, Ohio, was Dr. M. E. Sadler, Fort Worth, Texas.

**DOGS.** Champion Hetherington Model Rhythm, 6-year-old wire-haired fox terrier, carried off the most coveted award in dogdom when she went best in show at the seventieth annual exhibition of the Westminster Kennel Club held in New York's Madison Square Garden.

Winner of the American fox terrier specialty show only four days before, the almost white bitch owned by Mr. and Mrs. T. H. Carruthers 3d of Glendale, Ohio, performed with all the poise of a well-mannered grandmother to reach a pinnacle that two of her offspring, Ch. Hetherington Pilot and Ch. Hetherington Nurse had just missed in 1944 and 1945.

The dam of three litters, Rhythm became the first fox terrier since 1937 to take down Westminster's top prize and in so doing she automatically won the James Mortimer Memorial Trophy for the best American bred entry. But not content with those honors, Rhythm—whose owners plan to retire her—also teamed with Hetherington Nurse to gain the best brace prize.

All of the big shows were back on the canine calendar last year and the Morris and Essex Kennel Club exhibition, blue ribbon classic of the outdoor ring, was revived after five years. A solid black American type cocker spaniel, Benbow's Beau, won the major award at that show. Owned by Robert A. Gusman of Atlanta, the Beau is an outstanding example of his breed and really had to be at Madison, New Jersey, where he triumphed in a field of 2,086 entries.

Shed of Arden, property of Mrs. Paul Bakewell 3d of St. Louis won the national retriever trials to regain the title she held in 1942 and 1943. The Labrador won after the closest kind of competition with Tonkahof Esther Bell, a golden retriever from the Kingwre Kennels at Winona, Minnesota.

Highest award for bird dogs was annexed in the

national field trials by Mississippi Zev, favored setter of Dr. Russell Trapp of Tusculumbia, Alabama. The National Fox Hunters all-age stake was won by Hill Top Hustler, hardy hound owned by Lamar Taylor of Maryville, Tennessee.

THOMAS V. HANEY.

**DOMINICAN REPUBLIC.** A republic of the West Indies occupying the eastern part of the island of Hispaniola. Area: 19,332 square miles. Population: 2,059,000 (1946 estimate). Capital: Ciudad Trujillo.

Most of the land surface is mountainous, with steep, narrow ranges separated by deep valleys and pocketlike lowlands. There are two principal lowland plains; one between mountain ranges parallel to the north coast, the other along the southern coast. High temperatures prevail in the lowlands throughout the year.

**The People.** According to the census of 1935, the population is composed of mestizos (71 percent), Negroes 18 percent), and whites (13 percent). Most of the people are concentrated near Santiago and on the southern coastal plain. The chief cities are: Ciudad Trujillo, 80,000; Santiago de los Caballeros, 34,000; and San Pedro de Macoris, 19,000.

Spanish is the official language. Roman Catholicism is the predominant religion.

In 1942 it was estimated 33 percent of the population was literate. In 1945, there were 2,478 schools with a total enrollment of 232,316. In 1945 the University of Santo Domingo had 1,000 students.

**National Economy.** The economy of the country is almost entirely agricultural. The Dominican Republic ranks fourth among Latin American countries in the production of sugar, its chief crop and most important industry. Production of cacao and coffee are next in importance. Other crops are: corn, mandioca, rice, sweet potatoes, beans, and plantains, grown chiefly for domestic consumption. Yucca is cultivated both for its food value and for the manufacture of starch for export. The 1944-45 coffee crop amounted to about 425,000 bags (of 60 kilograms each); production of sugar for the 1944-45 crop year was 368,892 metric tons; in 1945 cacao production totaled 300,000 bags (70 kilograms each).

Processing of agricultural products constitutes the chief manufacturing of the country, which is largely for local consumption. During 1945, however, some exports were made of beer, peanut meal, candles, cigars and cigarettes, sole leather, shoes, hats and furniture.

**Foreign Trade.** Dominican exports for 1945 totaled \$43,564,113. Sugar and molasses accounted for most of the country's export trade; cacao, coffee and yucca starch made a large part of the remainder. Raw sugar exports in 1945 totaled 326,876 metric tons, most of which went to the United Kingdom. Refined sugar amounting to 3,015 metric tons was exported in that year. In 1945 a total of 17,151,229 gallons of molasses were exported; practically all was shipped to the United States. Exports of cacao in 1945 totaled 18,755,048 kilograms, valued at \$3,072,948. The exportable coffee crop for 1945 amounted to about 17,288,330 kilograms valued at \$4,880,054. The Dominican Republic also exports a variety of fruits, of which oranges are the most important.

Imports into the Dominican Republic in 1945 for the January-July period were valued at \$10,074,768. Manufactured and semi-manufactured products, and raw materials are the principal items imported. Textiles accounted for a good share of 1945 imports.

**Government.** Under the Constitution of 1942, the Dominican Republic is a centralized republic of 15 provinces. It has a bicameral legislature: a Senate of 20 members, and a Chamber of Deputies of 50 members. Members serve for 5-year terms. The president is elected for a 5-year term and is assisted by 13 advisers, 8 of whom are ministers. Generalissimo Rafael Leonidas Trujillo Molina was elected President on May 16, 1942, for his third term.

**Events, 1946.** During 1946 the scattered political information emanating from the Dominican Republic showed that President Generalissimo Trujillo did not permit oppositionists to freely express themselves or engage in any obvious political activity. In the early months of the year J. A. Bonilla Atiles, dean of the law school at the University of Santo Domingo, after refusing to support President Trujillo, was severely beaten and finally given safe conduct out of the country. Previously, oppositionist Servio Fuentes was shot down in the streets.

A series of earthquakes and tidal waves, beginning on August 4 threw the population of the Dominican Republic into panic, caused the deaths of at least seventy-three persons and left 20,000 homeless. The Fordham University observatory in New York reported that the shock was the most severe recorded on their instruments since the observatory was founded in 1910. For six successive days earthquakes battered cities and towns and tidal waves drove coastal inhabitants into the interior, causing an acute food shortage. The most critical situation existed near Bahia Escocesa (Scotch Bay) where food, clothing and medical supplies were at an extremely low quantity. The Red Cross set up emergency camps in the northern provinces, but thousands of people were forced to live in caves, trees and open fields.

After announcing a free Presidential election for May, 1947, the President ordered the formation of opposition parties. By August the Communist was the only opposition group to make itself known.

During late October demonstrators passed through the streets of Ciudad Trujillo. Reports on the nature of the disturbance were conflicting. In a cablegram to Miami, Florida, Manuel de Moya, secretary to President Trujillo, said that the Communists had attempted a coup.

President Trujillo changed his Cabinet on December 25. He appointed Arturo Despradel to be Foreign Minister, in succession to Manuel Peña Batlle, who was delegated as Ambassador to Haiti. Gen. Fauto Caamano was made Chief of Staff, in succession to Gen. Federico Fiallo, who became Under-Secretary of War.

**DOOLITTLE RAID.\*** The Tokyo Raiders, 80 U.S. Army Air Force volunteers commanded by Lieutenant Colonel James H. Doolittle, steamed into Japanese-held seas aboard the aircraft carrier *Hornet*, April 18, 1942, to strike targets in Japan. Their surprise bombing was the first World War II attack on the Nippon homeland, carried out at a time when the Allied peoples were desperate for a decisive, holding victory. They had looked to the United States for fresh troops and mounting quantities of war equipment to halt the overwhelming Axis blitz.

\* The material for this article was not available in 1942 and is included as a matter of historical record. Hitherto classified Army Air Forces Intelligence reports constitute the source material for this article, and it has been personally checked by Lieutenant General James H. Doolittle for correctness of facts.

Japan had struck at Hong Kong, Manila, Thailand, Singapore, Midway, Wake, and Guam simultaneously with its blow at American naval strength at Hawaii. At Bataan, Filipino-American forces prolonged a hopeless defense to extend the opportunity at home for industrial and military mobilization. Japanese troops had landed in the Netherlands East Indies to seize the Pacific riches: the oil, rubber, tin, quinine, hemp, coal, and iron of Borneo, Sumatra, and Java.

Weeks of planning and rehearsal preceded the American combat minutes over Tokyo. Lieutenant Colonel Doolittle (later Lieutenant General) was called to Washington by High Command officers shortly after the blow at Pearl Harbor and was selected to implement the scheme. Doolittle's strategy was to carry war to the Japanese home territory: bomb Tokyo factories and military installations; shatter the Nipponese delusion of imperviousness; plant seeds of dread in minds that had not yet learned to fear bombers overhead.

Air Force leaders, alert to the power of psychological warfare, took up the suggestion and began detailed plans for such a raid. Colonel Doolittle, renowned as a pilot, was appointed to train volunteer crews and lead the mission in combat.

The take-off point was to be an aircraft carrier, as there was no Allied land base with runway facilities, from which a fleet of bomb-loaded planes could reach Japan and safely return, left in the Pacific. The stunted runway of a carrier increased take-off dangers, however, and special short-runway instruction was earmarked for the pilots. If the Navy carrier crossed to a point 400 miles off the Japanese coast, as the plans anticipated, raiders could take off at dusk, attack Tokyo in the night, and arrive at China's Chuchow airfield early the next morning.

Success depended upon many hazardous factors, namely: to sneak the *Hornet* past the Imperial Navy; escape detection from merchant ships and stray planes; take-off from a carrier and bomb Tokyo targets before the strategic city could ready anti-aircraft defenses; escape pursuit planes and fly on to China, with shortened fuel supply; slip the *Hornet* back through an alerted Japanese fleet to the safety of the outer Pacific. Success depended upon absolute secrecy and surprise.

February and March 1942 were months of intense preparation. On the West Coast, the *Hornet* was readied to carry B-25 medium bombers on the long voyage. Rendezvous was planned at sea with other destroyers and cruisers, the whole task force to be commanded by Rear Admiral William F. Halsey, destined later to break the back of Japan's sea power.

In a Midwest hotel meanwhile, carefully selected medium bomber pilots were told of a mission that might take them out of the country for a few months. The target was not revealed. The dangers involved were matched only by the urgency of the job; every pilot volunteered for it. No outsider was to have an inkling of the destination nor of the preparation the pilots would undergo, not even their families.

The pilots joined volunteer crews of gunners, engineers, bombardiers and navigators at Columbia, South Carolina; then all flew south to Eglin Field, Florida, where training began. Colonel Doolittle, they soon learned, was a painstaking teacher who filled three intensive weeks with classes and rehearsal.

Lieutenant Commander Henry L. Miller of the Navy was assigned to teach the pilots the intricacies of lifting planes from a shortened runway.

Flags posted at distances of 200, 300, and 500 feet marked the shrinking area from which take-off was permitted. Low altitude bombing was introduced, with the disclosure that all planes would carry 500-pound bombs containing 50 percent explosive charges instead of the usual 35 percent charge. The flyers, unaware of their destination or the details of their mission, were mystified by the special training; some decided they were heading for submarine patrols off South America.

Radio equipment was removed from the planes and the secret Norden bombsight was supplanted by simple "twenty-cent sights" designed by Captain Charles R. Greening, one of the group's pilots. Not only would the Norden sight be impracticable at the proposed bombing height, Doolittle explained, but it was also highly possible that some of the B-25s would fall into Japanese hands. Soberly, the men dismantled bottom gun turrets, lightening each ship by 600 pounds.

Over-water flights and long night missions were run with only visual landmarks as guides. To simulate the venture ahead, the bombers swept in over the American coast and fanned out to travel the exact geographical land distances that would confront them over Japan. Low altitude approaches, pin-point bombing, and evasive anti-aircraft dodging were included in each flight, while gunners practiced firing at ground targets. Training ended with a last flight to Fort Myers, Florida, then across the Gulf of Mexico at very low level to Houston, Texas, and back again to Eglin Field. Although additional practice would have improved crew efficiency and teamwork, time allotted for training had run out; the string of bombers took off from Eglin Field for California.

Several days later at the Alameda Naval Base, the airmen were surprised to find the *Hornet* tied up at dock, waiting for them. On April 3, 1942, the flat-top steamed into the Pacific with 16 B-25s loaded on her flight deck. She never reached her destination 400 miles off Japan.

The objective was officially announced on the high seas, confirming the guesses of some of the crews. All the unusual preparations finally fitted into a logical picture. Now, experts lectured on Japanese history, on the differences between Japanese and Chinese philosophies and politics, and especially on geography. Dozens of maps and aerial photos of Tokyo and four important nearby cities were committed to memory.

Each pilot had his specific target, with alternates if the primary target was unavailable. Objectives covered a 50-mile front to include the vital installations in the area, spreading thinly over possible anti-aircraft nests. Doolittle planned to befuddle the Japanese into thinking a much greater number of planes had taken part. The first flight of bombers, led by Lieutenant Travis Hoover, would sweep the northern part of Tokyo; the second, under Captain David M. Jones, was to cover central Tokyo; the third, led by Captain Edwin J. York, was to cover southern Tokyo and the north-central part of Tokyo Bay; the fourth flight, under Captain Greening, was to raid southern Kanagawa, Yokohama City and Yokosuka Navy Yard; and the last flight would proceed to Nagoya and break up—*one plane bombing Nagoya, one Osaka, and one Kobe.*

Doolittle's plane would take off first, head straight for Tokyo, and lay down clusters of incendiaries to highlight the targets for the flights that followed. American Naval officers familiar with Tokyo, pointed out that seven sizable fires in the Japanese capital would be enough to spread the conflagration so that it could not be extinguished.

It was noted that machine shops probably existed under half the fragile-looking roofs. Emphatic orders kept all planes away from the Temple of Heaven, the Emperor's palace; no bomb could be wasted on a non-military or non-industrial target, for each plane carried only 2,000 pounds of demolition bombs or incendiaries.

As the *Hornet* proceeded slowly westward, care of each plane doubled. Instruments were checked, ships stripped of bare flying essentials, seats adjusted to make movement freer inside the cramped cabins, and ways of carrying extra gas-loads were devised. To stretch 900 gallons of fuel over hundreds of flying miles was a constant worry. Mechanics had previously fixed an extra tank where the bottom gun turret had been, added another in the bomb bay, and installed a collapsible tank in the catwalk above the bomb-bay. On shipboard they loaded 10 emergency five-gallon cans aboard each plane. It still left no margin for error.

Another carrier, the *Enterprise*, joined the task force five days at sea, after which word was passed to every officer and man of the combined force disclosing the purpose of the mission. Naval air squadrons from the *Enterprise* flew search and patrol sweeps every dawn and dusk, maintaining keen watch for Japanese vessels. The task force now consisted of two carriers, four cruisers, eight destroyers, and two tankers.

Tension mounted aboard the *Hornet* as she plowed deeper into Nipponese waters. Finally, she pulled away from the main task force to continue onward towards Japan, accompanied only by the *Enterprise* and four cruisers. Battle stations were manned twice daily.

An unidentified patrol craft was finally sighted on the radar screen at 3:10 a.m. on April 18th, and soon a second ship. Each time the course was changed. The third ship, however, was very close, and undoubtedly sighted the *Hornet*; this made it necessary for the carrier to sink it. It was not known, however, whether the B-25 bombers on the flight deck had been observed, but it was assumed that warnings had been radioed to Tokyo. The chance to maneuver the *Hornet* closer to Japan had passed. To maintain the advantages of a surprise attack and to insure the *Hornet's* escape from dangerous waters, immediate take-off was ordered. At 35° 43' North Latitude, 153° 25' East Longitude—800 miles from Japan, instead of the planned 400—the Air Force flyers gunned their motors and prepared for flight.

There would be 824 flying miles to Tokyo, and then at least 1,200 miles further to China, with landings in the East China Sea a likelihood. Doolittle cautioned his men, therefore, to ready their rubber rafts and prepare to row in to the coast in case of a crash landing. Siberia was to be avoided, for the Soviet Union had not declared war on Japan then, and American flyers would have to be interned. In spite of the additional distance hazard, extra B-25 crews aboard the carrier offered their bankrolls for a place in a plane; they found no takers. In those last moments, five more five-gallon tins were loaded in each bomber.

At 8:20 a.m., Doolittle's 31,000-pound bomber pulled up to the starting line. He warmed and idled his motors until the signalman at the flat-top's bow flagged him to race them. As the flag swung faster and faster in circles, Doolittle opened his throttles until the plane trembled with the vibrations. The signalman timed the dip of the carrier into each wave to give the B-25 the benefit of a rising deck on take-off. At last he motioned Navy crews to remove the wheel blocks. With flaps

down, motors at full throttle and left wing stretching far over the port side, the plane lunged slowly into the gale that swept down the deck. His right wing almost touched the ship's island; the left wheel stuck to a white line painted down the deck; the speed increased, and just as the *Hornet* cut through a wave at the top of its rise, Doolittle pulled his bomber off the deck with only yards to spare. It hung almost straight up on its propellers, then leveled off, came around in a tight circle, and shot low down the line painted on the deck. The *Hornet* was giving bearings; Admiral Halsey had headed it for the heart of Tokyo.

Within an hour, every bomber had taken off safely. The planes dived down to water level, clipping the wavetops at 15 or 20 feet, and flew in a long line toward Japan. Pilots had been cautioned not to drop the gas cans one by one as they were emptied, to prevent a trail straight back to the carrier. The raiders spotted no other ships until they were an hour on course and by then they were positive Tokyo had been reached.

Japan, with her mathematically precise farms, appeared surprisingly low in the water when land was finally sighted. People below waved at the American bombers, mistaking the blue circle, white star, and red ball emblems on wings for the red circle of the Imperial Japanese Air Force. Children in school playgrounds looked up, curious; farmers in the fields stopped work to watch the planes just overhead. Then the sudden drone of six Zeros at 1,500 feet spotlighted the reality of the bombing mission. The Zeros did not attack.

Just 30 minutes after landfall, the American raiders flew over Tokyo Bay, then on to the city itself, protected by barrage balloons. The flights split up and headed for the assigned targets, climbing to 1,500 feet for safer bombing altitudes.

Tokyo had been caught napping. Either communications were faulty, or radio warnings had been ignored, for in the streets eight million inhabitants were unaware of the impending attack. Doolittle's bomber roared over a ball park before the players and spectators scrambled for shelter. City-wide explosions a few minutes later awakened them to the actuality of a homeland bombing.

Bomb-bay lights blinked in each plane as the 500-pounders dropped on their targets: a tank factory; a cruiser still in its shipyard; an airplane plant; steel plants; powder factories; machinery works; railroad yards and sidings; docks; arsenals; and oil refineries. Sixteen tons of demolition and incendiary bombs hit practically all primary targets.

The bomb runs were done in just 30 seconds—seconds which had cost months of preparation, and millions of dollars, and might yet cost American lives. The job done, each bomber dived to the safety of housetops and the protective smoke and haze curling at the city's edge. Flak appeared ahead and off to the sides of the planes, missing the B-25s, but destroying some of the city's barrage balloons. Fighter planes, however, came up in pursuit. When several of them attacked Captain Greening's ship, he dived under low hanging power lines while his own gunners shot down two fighters. His gasoline refinery and storage works targets were still visible at a distance of 50 miles, shrouded in flames.

The weather, thus far, had been favorable, but it could not be predicted for the time when the raiders were to leave Japan. Storms rolled eastward off the China shelf at this time of the year with winds that drained gasoline reserves. Out at sea, mist obscured flying vision and rain suddenly splattered on windshields.

The raiders headed south from the Honshu main-

land, sighted volcanic landmarks, Yaku Shima and Sumi Gunto, then navigated due west. Fishing boats were scattered on the China Sea, and one crew sighted submarines refueling from a gasoline tender, but they had no bombs left. Gas supplies were almost exhausted; fortunately the storm wind was at their tails, blowing twenty-five miles an hour toward China.

The Chinese mainland was already dark, with ceiling zero, as the first bombers came in over the shoreline. Forced to climb to 6,000 and then to 8,000 feet over the mainland, the flyers could not discern the landmarks. Doolittle radioed Chuchow, but received no response. Gasoline gone, the time had come to bail out, over land that might be Japanese occupied. At 9:20 p.m., thirteen hours after take-off from the *Hornet*, Doolittle set the automatic pilot and bailed out after his crew.

The valor of those 80 Tokyo raiders set the Army Air Force standard for the years of war that followed. Most of the fliers landed in Free China and walked their way to Chungking. Colonel Doolittle radioed General Ho Yang Ling of the Western Chekiang Province requesting that watch be kept along the seacoast for all planes that might have landed near the beach or had gone down at sea.

The first brief mission report was wired to the Commanding General of the Army Air Forces, Henry H. Arnold, two days later: "Tokyo successfully bombed. Due to bad weather on China coast, believe all airplanes wrecked. Five crews found safe in China so far."

With the help of farmers and Chinese soldiers, thirteen crews eventually reached Chungking. Some had parachuted over occupied China and were hidden away until they could be slipped through to free territory. Contradictory to orders, one crew that was desperately short of fuel, had navigated the shorter route to Siberia. The plane was landed successfully and the crew interned; later, they were returned to American control.

Lieutenant Ted Lawson, as a result of a crash landing, had to have his left leg amputated. Corporal David Thatcher, turret-gunner in Lawson's plane, persuaded Chinese fishermen to carry his injured mates to temporary safety around enemy outposts and bound up their wounds.

Of all the men who parachuted in the night, three were killed in accidents: Corporal Leland D. Faktor was found in the mountains, believed to have had a second and fatal fall after reaching the ground; Sergeant William J. Dieter and Corporal Donald E. Fitzmaurice were found dead on the shore of a river. Japanese troops captured the eight remaining fliers.

Efforts were exerted to buy the freedom of the eight fliers taken prisoner, but without success. The men were charged with bombing non-military targets and schools, and strafing innocent children. The charges were completely unfounded, but at a ludicrous trial in which no American testimony was translated for a Japanese tribunal, the fliers were condemned to death. Five sentences later were commuted to life imprisonment "by the gracious consent of the Emperor," and prison treatment involved months of solitary confinement and beatings. Lieutenants William Farrow and Dean Hallmark and Sergeant Harold Spatz were executed. Lieutenant Jay R. Meder carved on the wood floor of his cell the message: "Please notify US Army. Life imprisonment." He died in prison of beri-beri. Four survivors were returned to the States at war's end in 1945.

Official release of the Tokyo Raid was withheld until the majority of the raiders reached Free

China, in order to protect the Chinese towns that had aided the fliers. As well, it was of special urgency that the *Hornet's* presence in Japanese waters remain secret until the carrier had eluded all warships and reached the outer Pacific. In the months that followed, Nipponese tension was at a peak, for the starting point of the raiders remained a mystery; as the Americans planned, the Japanese conjectured there might yet be some secret base in the North Pacific, or a nearby aircraft carrier, or equipped airfields in Free China. Japanese merchant ships fine-combed the sea, and the Imperial Staff was forced to reassign crack air squadrons to homeland defense.

By all military counts, the Doolittle mission was successful. Demolition bombs wrecked or badly damaged war factories, communication arteries, ammunition stores, military barracks, and oil and storage warehouses.

The psychologic damage was inestimable. The Nipponese were no longer impervious; instead, they commenced to watch and wait for further bombings. Fire-fighting brigades were enlarged, anti-aircraft defenses expanded; in a thousand ways, the people fearfully prepared for other raiders. War production efficiency was reduced. Most important of all, air interception squadrons were strengthened in the homeland, thus reducing enemy air units in the Pacific and China.

Information gathered over Tokyo colored future Air Force strategies. It was plain that Japanese communications were loosely organized and slow to act. Even the city of Kobe, raided one hour after Tokyo, had not been warned. Enemy troops on the mainland were inferior to overseas fighters. Their anti-aircraft was inaccurate as was the fire directed from pursuit planes.

Colonel Doolittle recommended that American war plants be dispersed over broad areas and camouflaged expertly, a lesson learned from the omission of Japan to carry out such a program. It was also imperative to equip small boats with radios and simple codes, to serve as plane detectors and speedily warn coastal cities. To complete coastal security, modern planes and trained interceptor pilots would have to be retained at key fields within the States.

Modifications in equipment were also recommended. Combat had tested guns, gunsights, turrets, fuel pumps and other instruments in the B-25; improvements were possible. Most work had to be done, however, with personnel training and preparation. The raiders had had little chance to perfect their gunnery and not enough time to operate as a team. Their experience modified Air Force training programs so that later crews approached combat with clock-like precision and the fluid cooperation of highly effective fighting units.

Distinguished Flying Crosses were awarded all the Tokyo raiders, while grateful China added her coveted Military Order honor. Lieutenant J. R. White, a flight surgeon who had risked his life to give medical aid to crash victims, and Corporal Thatcher each received the Silver Star. Doolittle was decorated with America's highest award, the Congressional Medal of Honor, "for conspicuous leadership above and beyond the call of duty, involving personal valor and intrepidity at an extreme hazard to life."

The Tokyo raiders had given new incentives and a glimpse of the inevitable victory to Allied fighters everywhere.

**DUKE ENDOWMENT.** A foundation created by James B. Duke in 1924, known for its connection with

Duke University, hospital work, and a number of other activities in the Carolinas. The Endowment is a permanent one with a self-perpetuating board of 15 trustees. Except for the \$17,000,000 spent in erecting and equipping Duke University, it is not authorized to expend any of its principal. A report covering its first twenty-one years, ending December 31, 1945, showed that the Endowment had distributed and allocated \$62,975,607 as follows: Duke University, \$35,312,858; hospitals, \$18,837,852; Davidson College, \$1,510,025; Furman University, \$1,508,650; Johnson C. Smith University, \$1,069,531; orphanages, \$2,437,189; superannuated Methodist preachers, \$496,691; rural Methodist churches, \$855,828 for building and \$946,981 for operations. Chairman of the Trustees: George C. Allen. Headquarters: Power Building, Charlotte 1, North Carolina.

**ECUADOR.** A republic of South America. Area: National territory, including the Galápagos Islands, and following settlement of the frontier dispute with Peru, is estimated to be 259,790 square miles. Population: 3,171,376 (1943). Capital: Quito.

Ecuador is divided into three regions: coastal, sierra or Andean highlands; and Oriente or Amazon region. The climate varies from tropical in the eastern and western lowlands, through temperate in the plateaus, to cold on high mountain peaks.

**The People.** The people of Ecuador are almost evenly divided between Indians, who live in the Oriente, and those of Spanish and Indian origin who live in the coastal zone. About 4 percent of the population are Negroes, living mostly in the tropical coastal lowlands. The largest cities are: Quito, 165,924; Guayaquil, 172,948; and Cuenca, 52,519.

Spanish is the official language, but Indian dialects are widely spoken and taught in some communities. Roman Catholicism is the predominant religion.

It is estimated that 38 percent of the population is literate. In 1942 there were 3,181 primary schools with a total of 275,046 students, 70 intermediate schools with 11,193 students, and 4 universities with a total enrollment of 1,885.

**Government.** Ecuador is a centralized republic of 17 provinces. (The Galápagos territory was given provincial status in 1945.) The Constitution of 1945, succeeding the Constitution of 1906, provides for a unicameral legislature, the Chamber of Deputies, composed of 3 deputies for each province having up to 150,000 inhabitants and increasing by 1 deputy for each 75,000 additional inhabitants. Two deputies will be elected by each of the eastern provinces as long as their population is less than 150,000, and the Galápagos Islands will elect 1. There will also be "functional" deputies representing certain business and professional groups. The Congress will meet annually on Aug. 10 for 90 days. Deputies are elected for 2-year periods. The president is elected for a 4-year term. Dr. José María Velasco Ibarra has been President since May 28, 1944.

**Events, 1946.** By the end of March, the relative political tranquillity that followed the ousting of President Arroya del Río in May, 1944 and the Congressional election of Dr. José Velasco Ibarra to the Presidency, was broken. During the early months of 1946 a steadily rising cost of living and increasing friction between the various Ecuadoran political parties provided signs of general unrest.

The impending crisis broke into the open on March 30 with the Government announcement of the discovery of a plot to assassinate leading mem-

bers of the Velasco regime. Censorship was imposed and constitutional liberties withdrawn as the Government arrested more than thirty leftist political leaders and retired army officers. Among those arrested and deported to Peru were former President (1937-38) Alberto Enríquez and Congressman Julio Teodoro Salem. The suspension of liberties and the padlocking of the Tribunal of Guarantees, the only agency with the power to deport, brought protesting crowds into the streets of Quito and demonstrations by the students of the Central University. On April 5 President Velasco reported the full restoration of freedom of the press and other constitutional guarantees. Expressing the hope that full normality would return within two weeks, he promised that the Congressional elections, called for May 5, would be "absolutely free." The crisis of March 30 did not quickly expire, for on April 10, Carlos Cueva Tamariz, second Vice-President of Congress, summoned his colleagues to a meeting where it was quickly agreed to hold a special Congressional session on April 16 to consider the situation created by the Velasco decree. Notice of this move was followed by the arrest of Cueva Tamariz.

The decision to call a Congressional election, as announced by the President, developed into a crucial issue as all political parties lined up against the proposal. According to the Constitution a call had to be issued thirty days prior to the election date. Despite Velasco's desire to hold the elections as scheduled, a tie vote in the Supreme Electoral Tribunal balked the call. Opponents claimed that abnormal times proved a poor basis for a free election. When Velasco issued the call himself, the Liberal, Socialist, and Communist parties, which had originally supported him, refused to participate in the elections. The Conservatives were at first amenable to the election date, but then agreed that the time was not favorable and united with the Liberals on a counter-proposal. They suggested that the election of a regular Congress be dropped in favor of a Constituent Assembly which would rewrite the 1945 Constitution.

President Velasco agreed to the suggestion on April 12 and later established the election date for June 30. Post-election plans provided that a special committee would draw up a draft Constitution for Assembly consideration on August 10. After a thirty-day period of discussion the Constitution would be adopted by the Assembly, which would then become a regular Congress.

The proposal was rejected by the Socialists and Communists on the grounds that there were insufficient guarantees for a free election and later by the Liberals who decided that a free election could not be held while many leftist leaders were in prison or exile. The refusal of the leftist parties to participate in the elections left only the Conservatives, the dominant party, and the UPERRA (Unión Popular Republicano) with candidates.

Registration of voters—made compulsory by the Constitution—showed a record total of 304,000. Of the sixty-two seats open, Conservatives won thirty-three, dissident Liberals twenty, and independents and minor parties the remaining nine. Several thousand ballots were left blank in objection to the elections.

During the early weeks of July little news filtered out of Ecuador. Public unrest reportedly increased to an extent where the Conservatives publicly promised to request Velasco's resignation. Fearing the appointment of a Conservative President, the Communists promptly came to Velasco's support, and in the ensuing hue and cry, the Conservatives

agreed to Velasco's Presidency if Interior Minister Carlos Guevara Moreno were removed. On July 31 several army officers and political leaders were imprisoned.

The initial meeting of the Constituent Assembly on August 10 witnessed the re-election of Velasco and the quick frustration of a revolutionary coup. An armed group of civilians, attempting to storm the Ministry of Defense, was repulsed after two of the revolutionists were injured by guards. Hector Vasconez, Liberal leader, and several Socialists were ordered arrested.

Contrary to the rumored indications that the Conservatives would not reappoint Velasco were he to resign, the President won an easy 43 to 10 victory.

The favorable vote, however, belied a basic conflict between the President and the Conservative-dominated Assembly. Against the opposition of Velasco, the Assembly proposed changes to the Constitution by removing many accomplishments of the liberal Governments that had been predominant since 1900. In quick succession the Assembly eliminated the Constitutional sanction for divorce, proposed to return tracts of farmland to religious orders from which they had been taken almost fifty years earlier, and voted to pay state subsidies to private schools, most of which were Catholic. Velasco's insistence that all education be given equal respect forced a change in the Constitution from "Lay education in the secular sense shall be free" to "Education shall be free."

The new Constitution prohibited confiscation of property and provided that remuneration be made in cases of expropriation for public benefit. Quito newspapers reported that freedom of the press was permitted by the Constitution, so long as calumny, insults, and information contrary to public interest are avoided.

On November 29 the Assembly voted again on the Presidency and approved the continuation of Velasco's term of office until September 1, 1948.

The United States occupation of Seymour Island in the Galápagos group, which began on December 11, 1941, ended early in July. The island, 323 miles off the coast of Ecuador, was used during the war as an airbase and a western outpost for the defenses of the Panama Canal.

**National Economy.** Ecuador is primarily an agricultural country. Rice, cacao, and coffee are the leading crops, but sugar, corn, potatoes, barley, wheat, bananas, and other fruits are also important. Cattle and sheep raising is the leading pastoral industry. Forest products, including rubber, balsa wood, kapok, and tagua nuts are exported. In 1945, rice production totaled 3,000,000 quintals; cacao production amounted to 310,000 quintals; and the coffee crop totaled 320,000 quintals.

Ecuador's principal mineral products are petroleum, gold, silver, and copper. In 1944 production of crude petroleum rose 25 percent above 1943 and totaled 121,471,895 gallons; refined petroleum products rose 17 percent to 40,371,029 gallons.

\*There is little manufacturing in Ecuador, textiles making up the leading industry. Shoes, cement, sugar, flour, soap, and candles are produced for the home market, and toquilla (Panama) hats are exported.

**Foreign Trade.** Ecuadoran exports in 1944 totaled 466,630,308 sucres. Major products exported were: rice, coffee, cacao, rubber, Panama hats, balsa, and bananas. In 1944 crude petroleum exports totaled 1,964,700 barrels. The U.S. is the leading market for Ecuador's exports, taking 85 percent of the cacao and 89 percent of the coffee exports in 1943

and 1944. Other important purchasers are Cuba, Peru, Venezuela, and Chile.

Imports in 1944 were valued at 331,155,885 sucres. Principal imports include: foodstuffs, beverages, cotton textiles, pharmaceuticals, machinery, metals and manufactures. In 1943 and 1944 the United States supplied about one-half of Ecuador's total imports. Other leading sources of imports were: Peru, Argentina, Mexico, Great Britain, and Brazil.

JOSEPH P. BLANK.

**EDUCATION.** The most important development in education, during the first full year of peace after World War II, was in the field of international educational relations as the educational leaders of many countries sought new and better ways of promoting understanding and cooperation among all peoples.

The United Nations Educational, Scientific and Cultural Organization came into full being in 1946. Its constitution was drawn up in November of 1945, and its Preparatory Commission set up a secretariat which began work early in 1946. Throughout the winter, spring, and summer months the secretariat worked in London as provided in the constitution until the organization should come into full being and move to its permanent seat in Paris. The secretariat had the help of several reviewing committees in various fields during May and June. At a meeting of the Preparatory Commission in July, it was agreed that UNESCO should concern itself with international problems, and should examine national problems only as they had international educational, scientific, or cultural implications. The Preparatory Commission also declared that UNESCO should make full use of all existing agencies and facilities, stimulating them to action, bringing them into being in areas where they did not exist, and undertaking to operate programs itself only when all other measures fail.

The Preparatory Commission submitted a progress report on the program of the organization in August. In this report it made extensive recommendations concerning the principles under which UNESCO should operate, the secretariat of the organization, and the character and scope of recommended activities in the fields of education, mass communications, cultural institutions, natural sciences, creative art, and the social sciences and humanistic studies.

In the field of education the Preparatory Commission suggested that UNESCO should collect and disseminate educational information, coordinate the work of other agencies, stimulate other agencies and facilitate their work, initiate educational projects, and operate educational programs in fields where they are most needed, and where an international agency is necessary. Among the specific jobs proposed for the organization were: a study by a small committee of methods of teaching international understanding; sponsoring of citizenship clubs in schools of various nations; encouraging voluntary organizations to establish young people's work camps in devastated countries; convening an international conference on adult education; surveying provisions for education in the field of international relations; operating an international educational seminar in the summer of 1947; and studying the textbooks of schools in relation to the development of better international understanding.

The Preparatory Commission proposed also that the organization should launch an attack upon

ignorance throughout the world by helping all its members who desire such aid to provide a minimum or "fundamental" education for all its citizens. Other proposals of the Preparatory Commission related to health education, the improvement of educational methods, vocational training, selection and guidance, handicapped children, educational statistics, an educational yearbook, and an international education newsletter or review.

These proposals in the field of education together with proposals in the other fields of UNESCO's interest were submitted to the first annual conference of the organization held in Paris, November and December, 1946. At the opening of this conference over twenty nations had formally accepted the constitution of the organization and had sent representatives to the Paris meeting. Julian Huxley of England was appointed the first director-general of the organization and plans for setting up a permanent secretariat were initiated.

In accordance with Article vii of the UNESCO constitution the United States government appointed a National Commission for cooperation with UNESCO. This commission is composed of sixty representatives of national educational, scientific, and cultural organizations, fifteen distinguished leaders in these fields chosen from the country at large, fifteen persons employed by state and local governments, and ten persons employed by the federal government. The United States National Commission met in September, 1946, and carefully reviewed the proposals of the Preparatory Commission and prepared recommendations for the American Delegation to the general conference in Paris. The education members of the National Commission supported strongly the study of means of teaching better international understanding. They favored the calling of conferences and the carrying on of researches on the causes, treatment, and outcomes in terms of individual and group tensions, of all handicapping defects and deficiencies, physical, intellectual, and educational, both among children and adults. They also supported conferences on adult education, international education, and textbook revision.

Activities relating to UNESCO were only part of the large number carried on throughout the world in the area of international education. The International Bureau of Education sponsored the Ninth International Conference on Public Education in Geneva in March. The governments of thirty-six nations were represented and reports from various countries on postwar school reforms were given.

In September and October, the first postwar international conference of the New Education Fellowship was held in each of the six states of Australia. The theme of the conference was "Education for International Understanding." Many organizations in various countries increased their grants for student exchanges with other countries. An example of such effort in the United States was offered by the American Association of University Women, which gave grants to thirty-nine women students from Europe to enter American colleges and universities during the year.

A group of educational organizations in the United Kingdom and a similar group in the United States with the technical help respectively, of the United Kingdom Ministry of Education, and the United States Office of Education arranged an exchange of teaching positions among 148 British and American teachers.

The so-called Fulbright Bill was passed by the

Congress but did not come into effective operation during the year. This bill provides that surplus property of the United States in foreign countries may be purchased by those countries, and a substantial proportion of the payment may be used in the promotion of exchanges of teachers, students, and other educational, scientific, and cultural workers with the United States.

At the invitation of the National Education Association of the United States representatives of teachers' organizations from twenty-eight countries met at Endicott, New York, during the last two weeks in August, and established a World Conference of the Teaching Profession. They drew up a constitution and a program for cooperation with UNESCO and other international agencies, in the improvement of educational facilities and the elevation of the status of teachers throughout the world.

Also, during August a World Congress on Air-Age Education was held in New York City.

Problems of meeting the educational needs of war-devastated areas were attacked by a technical subcommittee of the Preparatory Commission of UNESCO which collected information from various countries concerning the most pressing needs of schools and other educational, scientific, and cultural agencies in such countries. In June the American Council on Education announced the establishment of a Commission for International Educational Reconstruction with representatives from about twenty major educational organizations and agencies of the United States. This Commission set itself the tasks of informing the American people of the needs of the war-devastated countries for educational assistance, of assisting member organizations in planning effective programs of educational rehabilitation, helping the organizations to ship supplies, offering scholarships, and sending educational missions.

Problems of the re-education of occupied countries received considerable attention during the year. In February and March the United States Department of State and Office of Education provided the Department of War with an education mission to advise the supreme commander of the allied powers in Japan on policies of educational improvement in that country. A similar mission was sent from the United States to the office of the military government of the United States in Germany during August and September. Both missions gave detailed reports and recommendations to the military government authorities and to the educational leaders of the countries concerned.

On July 13 President Truman appointed a National Commission on Higher Education to re-examine the system of higher education in the United States in terms of its objectives, methods, and facilities, and in the light of the social role of higher education. The commission was asked to consider methods of expanding school opportunities for all able young people and means of paying for such expansion.

The tremendously expanded enrollments in the higher educational institutions of the United States, which were largely responsible for the formation of the National Commission on Higher Education, appeared to be largely, but by no means wholly, brought about by the return of veterans of the armed forces to their college and university work. Many special devices and agencies for extending the services of the colleges were employed. Teaching centers were established off-campus by many universities, and a large number of junior colleges

and one-year and two-year extensions of secondary education were inaugurated.

Among the various new types of collegiate education developed during the year one of the most spectacular was that offered by the new Roosevelt College of Chicago, Illinois. This college, established in 1945, by the fall of 1946 had more than trebled its original enrollment of 1,200 students and had approximately doubled its original faculty of eighty-four. Its unique features, however, came from its constitution rather than from its enrollment. Its Board of Directors included members of its faculty and representatives of management, organized labor, cooperatives, education, press, and judiciary in its community. The president and the deans of the college held office by reason of a vote of confidence which had to be secured every three years.

Shortages of properly educated teachers continued to be very grave throughout the world. In the United States the National Education Association Commission on Teacher Education and Professional Standards recommended a minimum salary for a teacher who had four years of college preparation of \$2,340 per year, to be paid on a fifty-two week basis and to advance by annual salary increases to \$4,000 a year. The Commission also recommended classes of 25 to 30 pupils in high schools, organized on a departmental basis, and total loads of not more than 100 pupils in classes and in extra-curricular activities for each teacher. The Commission pointed out that effective tenure, retirement, and tax legislation would be necessary to meet these recommendations. It noted that the United States was spending 1.5 percent of its national income on elementary and secondary education as compared with approximately 2 percent of the national income in England and 5 to 8 percent in the U.S.S.R. Substantial federal subsidies of education were obviously necessary, according to the Commission.

Proposals for federal aid of education in the United States drew strong bi-partisan support in Congress. A bill to provide \$1,500,000 for the fiscal year 1947, \$2,000,000 for 1948, and \$2,500,000 for each year thereafter to support a minimum program for education in the country, with state control of education carefully safeguarded, failed to be enacted in the Seventy-Ninth Congress. The Senate Committee on Education and Labor reported the bill favorably, but the House Education Committee refused by one vote to report the bill for favorable action.

More than three million veterans of the United States armed forces applied for education and training in 1946. More than one million of these veterans were enrolled in colleges and universities in the fall of 1946.

Throughout the world new emphasis was placed upon the teaching of foreign languages, particularly those foreign languages which were coming into wider use as international languages. Along with the teaching of these languages was an increase of instruction in the history, political institutions, society, and economy of the countries using the languages. In the United States many universities introduced study of Russian and Chinese, with some of the larger universities establishing Russian institutes and centers for Slavic studies. New attention was paid to the study of Arabic in American and British universities.

In the United States a special attempt was made to evaluate the various methods and devices of instruction employed by the armed forces during the war. The American Council on Education

sponsored a comprehensive review and evaluation of the contributions of the armed forces to educational methods.

HAROLD BENJAMIN.

**EDUCATION, U.S. Office of.** During the fiscal year ending June 30, 1946, the United States Office of Education sought in many ways to provide effective leadership and assistance to the schools and colleges.

**General Services.** Basic statistical data concerning education in the United States continued to be collected and compiled by the United States Office of Education during 1946, together with special studies undertaken to meet requests from other Government agencies to the general public. Data included studies of school and college enrollments, land-grant colleges, college income and expenditures, and expenditures per pupil in city school systems.

The Office cooperated with organizations and agencies both outside and within the Government in a variety of special war and postwar services including the following: the utilization and disposal of surplus property for educational use; cooperation with the President's Famine Emergency Committee; programs of health and physical education; work-school programs; the school lunch program; and the educational problems relating to the return of veterans to high schools and colleges.

Special attention was given to expanding programs for exceptional children, Negroes, Spanish-speaking groups, the children of migrant workers, and rural youth; the reorganization of administrative units and school programs to meet postwar needs; and the nutritional problems of pupils. Studies were made of school building needs, school lunchroom equipment, compulsory school attendance, juvenile delinquency, visiting teacher work, health and physical education, the public expense of supplying textbooks and other instructional materials, pupil transportation, pupil personnel services, curricular planning, preliminary plans to inquire into the teaching of United States history in secondary schools, and recreation services for children and youth.

**Elementary Education.** Throughout the year, specialists in the Division sought the solutions to several major problems facing elementary education as they undertook to serve the Nation's schools. The continuing teacher shortage, which called for the issuance of thousands of emergency teaching permits in the elementary schools, emphasized the necessity of giving widespread services on supervisory and instructional problems, education of exceptional children, and teacher education.

Elementary education activities in supervision and instructional services centered on conferences, workshops, and committee group effort. Bibliographies of courses of study and a guide to developing a unit of work were prepared and distributed. Special attention was given to broadening the school curriculum in the fields of nutrition education, for which a cooperative follow-up report was issued; fire safety, with a working conference and the preparation of a curriculum guide; conservation education; teaching about Latin America; and intercultural education. Extensive consideration was also given to health education and science in the elementary grades.

One of the foremost challenges was that of juvenile delinquency, and closely related was the problem of achieving closer parent-teacher cooperation. Workshops on extended school services, with sections on parent education were held in teacher

training institutions, and the Office gave intensive assistance in this field.

The postwar period brought such unprecedented demands for service in the development of State and local programs for the education of exceptional children that the Office restricted its research projects in this area in order to extend its assistance in the field. The agencies served included State and local school authorities; national, State and county societies for crippled children; State and national parent-teacher groups; the Attorney General's Conference on Juvenile Delinquency; the Children's Bureau; and a number of other interested personnel and organizations. In cooperation with a group of curriculum and guidance specialists, an extensive study of curriculum adjustments for gifted and talented children was completed and the report published by the Office. Other materials published on exceptional children discussed the facilities and methods needed in the schools for the adjustment of the physically, emotionally, and mentally handicapped.

The shortage of trained teachers was an ever-present problem involving a vast amount of research and close cooperation with national, State, and local organizations. Two meetings of the Association of State Directors and Supervisors of Elementary Education were held during the year to consider ways of meeting this situation and of improving elementary education. With the sponsorship of the Office, committees of this organization were appointed to give intensive study to the major problems involved and to develop plans for increasing cooperation and mutual service among the respective State supervisory staffs.

**Secondary Education.** In the decade 1930 to 1940, secondary school enrollments increased 10 times as fast as did the population group 14-17 years of age. Within the past two years, as funds became available, the Office of Education reorganized and expanded in order to keep pace with such phenomenal development. In 1946, specialists in Secondary Education were able to devote full-time services to science, school organization and supervision, rural education, health education, tests and measurements, instructional problems, and the social sciences.

An Advisory Committee on Secondary Education, called by the U.S. Commissioner of Education in 1946, advocated that the Office of Education exercise vigorous leadership in the field of guidance "both with respect to State departments of education and local schools and school systems." Another fundamental concept on which the Committee expressed concern was the need for coordination among the various subject areas. The fields of family life, health, recreation, and consumer education were considered significant. Of further immediate concern was the holding power of the secondary school; no more than 73 percent of our youth have ever attended high school, and the survival rate for those who do attend is of such critical proportions that the offerings of the secondary school are due for reexamination.

Secondary specialists, together with vocational specialists, spent particular effort during the past year in helping to implement the Prosser Resolution, which proposes to focus the attention of the schools on the development of a curriculum adequate to satisfy the needs of the majority of our youth, namely, the 60 percent who are destined neither for college nor for skilled occupations.

Other activities concerned a going program of projects undertaken in cooperation with State departments of education. The return of veterans to

high schools profoundly affected the service given by the high schools of the nation, and necessitated studies of the various provisions developed by the States, cities, and individual schools. Such studies promise far-reaching results. The widespread use of aptitude tests in World War II may also have significant contributions to make to testing programs in secondary schools.

**Vocational Education.** Three major fields of activity, in addition to administration of the federally aided program of vocational education, were engaged in by the Vocational Division during the fiscal year ending June 30, 1946. They were: (1) closing-out of wartime interests and activities; (2) salvaging useful assets from joint State-U.S. Office of Education war training programs; (3) assisting the States to accomplish objectives set forth in "Vocational Education in the Years Ahead," a report of a committee on vocational training problems in the postwar years.

Future programs in transition of agricultural education from war to peace look toward the following: (1) establishment of area schools in several States where they are needed to permit rendering more effective service to farmers; (2) rebuilding and strengthening of Future Farmers of America and New Farmers of America by resumption of activities that were curtailed during the war; (3) placing of additional emphasis on in-service training programs for employed teachers of vocational agriculture in order to permit upgrading of war emergency teachers and offering refresher courses to teachers just out of the armed forces.

The Veterans' Administration, in cooperation with the U.S. Office of Education, organizes and administers veterans' agricultural training. After passage of the Servicemen's Readjustment Act of 1944 (Public Law 346), Veterans' Administration felt that already established State facilities of the Office of Education's Agricultural Education Service should be utilized along with facilities of the Veterans' Administration to care for veterans who expected to farm. Accordingly, uniform policies for veterans are worked out in a series of conferences.

To assist them in making adjustment from wartime to peacetime business education programs, the States were given constructive help in (1) rebuilding supervisory staffs, (2) expanding teacher training, (3) laying out long-term occupational training programs, (4) developing bases for cooperation with trade, professional, and educational associations, and (5) planning cooperative research programs.

At the beginning of the fiscal year, 16 States were without the services of a State supervisor for distributive business education. In accordance with the recommendation of "Vocational Education in the Years Ahead," the Division encouraged employment of head supervisors of business education who would be qualified to give leadership and direction to all phases of their programs.

Major emphasis had to be given to rebuilding and expanding training facilities available to teachers both before and during their employment and expanding training facilities available to teachers both before and during their employment in the profession because of the following developments: (1) the de-emphasis of preservice training that was inevitable during the war, particularly in the case of teachers and coordinators in distributive education; (2) the serious shortage of qualified teachers, coordinators, and supervisors in every phase of business education; (3) the rapid turnover of both teaching and supervisory personnel;

(4) recognition of the need for greatly expanded local programs.

Research activities of the Business Education Service included a series of job analyses made in cooperation with the personnel group of the National Retail Dry Goods Association and the education committee of the National Restaurant Association. To lay the groundwork for cooperative part-time retailing classes, investigation was made into specific subject matter content, relative importance of instructional topics, job profiles in retail organizations and selection of students.

A staff member of Home Economics Education served as school lunch consultant for the Southern States Work Conference at Daytona Beach, Fla., participated in the school lunch supervisors' and managers' workshop at Teachers College, Columbia University, and helped prepare lists of equipment for school lunches for the Surplus Property Board.

A staff member also served as consultant to the home economics research committee of the American Vocational Association in drawing up a national study of factors affecting supply of home economics teachers. Assistance was given in further development of the Future Homemakers of America and New Homemakers of America, both organized in 1945. Fourteen national organizations were given assistance and thirteen different divisions of five other government agencies were given cooperation in problems of home and family living.

As most States during the war continued their trade and industrial education programs provided for under the Smith-Hughes and George-Deen acts, the termination of war production training programs did not pose reconversion problems. Throughout the war, State boards for vocational education were advised by the Trade and Industrial Education Service not merely to continue their regular programs but also to maintain standards. Among contributions made by the war programs to the regular trade and industrial education program are development of more effective teaching methods and establishment of trade education on a firmer footing.

Assistance to State boards, appearance on State and national fire-training programs, preparation of instructional materials and work with such organizations as the American Municipal Association and the Federal Bureau of Investigation to improve employee efficiency were among outstanding activities of the public service training consultant.

In extending facilities of the Occupational Information and Guidance Service to many phases of the guidance program, the field specialist visited 27 States, 56 cities, and 17 colleges and participated in one national conference, two regional conferences, and 12 State conferences. Through field visits, correspondence and conferences, the States have been made aware of the idea that guidance is a school responsibility and that each staff member must contribute to the program. At a national conference of State supervisors held in Denver, Colorado, fifty State supervisors, counselors, trainers, and school officials from 33 States considered programming and administration.

**Higher Education.** The transition period of war demobilization and reconversion brought unprecedented demands to higher education as more than a half million veterans and a backed-up flow of tens of thousands of young war workers joined the regular college population. Accompanying this unparalleled pressure for college service were serious shortages of qualified college teachers, college housing, and plant facilities.

To help meet the need for more and better qualified teachers, the Office prepared and disseminated materials useful in placing, recruiting, certifying, and employing teachers. In addition, the Division helped to set up certain criteria by which the War and Navy Departments agreed to release members of the armed forces for duty as college teachers. More than 500 men and women were thus released. Near the end of the fiscal year, the Office of Education was authorized by Selective Service to certify essential college teachers for deferment.

Specialists in the Division responded to requests from college officials for assistance in adjusting their programs and physical facilities, as well as their staffs, to the college population. The Division provided information and services to institutions on how to qualify for and secure from government surplus the additional facilities needed. These services included cooperating with the program for providing student housing for veterans through the Federal Public Housing Authority; formulating criteria for the use of the Civilian Production Administration in granting priorities to colleges for the use of scarce construction materials and screening cases that did not clearly meet the criteria; and evaluating requests made to the Federal Housing Authority for priority materials for faculty housing.

During the year the staff members of the Division carried on their work in the field of curriculum and course revision with an emphasis intensified by the growing consciousness of the new role of America in international affairs, of the need for more effective civic instruction, of new applications of the physical sciences, and of new developments in health, transportation, construction, and other fields.

The study of vocational education of college grade, which was initiated during the previous year, was completed. Late in the year a specialist in engineering education was added to the regular staff. The desirability of providing services to more than 150 engineering colleges and nearly 180,000 engineering students had been indicated by postwar demands for engineering information and personnel.

Extensive projects designed to improve and promote the education of Negroes were intensified throughout the year. Consultative and advisory services were continued as in previous years and the following agencies and institutions are typical of those served: Association for the Study of Negro Life and History, Bureau for Intercultural Education, Conference of Presidents of Negro Land-grant Colleges, United Negro College Fund, National Conference on Adult Education and the Negro, National Council of Negro Women, Lincoln University, Hampton Institute, Howard University, U.S. Public Health Service, and the National Education's Steering Committee on Education in the Cotton Belt.

Other services carried on by the Division included the following: consultative service to the American Association of Dental Schools, the American College of Dentists, and the National Association of Dental Examiners; a survey aimed at making an evaluation of certain programs and needs of Howard University and considering the relationship of the Federal Government to that institution; the preparation and publication of the periodical, *Higher Education*; and the preparation and publication of Part III, Colleges and Universities of the *Annual Educational Directory*.

The Division continued its reporting and certification activities related to land-grant colleges and

universities. During the year 1944-45, the latest year for which statistics are available, these 69 institutions enrolled 154,425 civilians and 38,890 military students in residence, a total of 193,315. The amount received by the land-grant colleges and universities for the year 1944-45, in accordance with the Second Morrill Act, the Nelson Amendment, and the Bankhead-Jones Act (Title II, Section 22) was \$5,000,030.

The Engineering, Science, and Management War Training Program was liquidated during the year. A staff member prepared a bulletin, "ESMWT—A Final Report," which is being published by the Office of Education.

**Central Services.** The newly reorganized Division of Central Services consists of the following units: Research and Statistical Service, Information and Publications, U.S. Office of Education Library, and Administrative and Management Services.

Research and Statistical Service, which includes the functions of analyzing and reporting basic data, supplements the staff of the various Divisions with technical assistance in special problems of research. During the past year the Service set up and conducted the research and statistical aspects of planning and reporting for the Surplus Property Utilization Program, and, at the request of the Veterans' Administration, developed a plan for establishing State centers for collecting and disseminating information on educational opportunities for veterans.

Staff members also served on interagency committees involving various other government agencies; prepared articles for professional journals; provided technical advisory service to a congressional committee and others studying problems of grants-in-aid to education; and assisted States, upon request, with research and survey problems.

In order to produce its materials with maximum efficiency, the Service introduced new methods of scientific sampling and experimented with graphic presentations for the use of nontechnical readers.

The Information and Publications Section performs the customary services of publishing the professional findings of Office specialists in official bulletins and of translating such findings into suitable form for dissemination through all media of communication, especially newspapers, magazines, and radio. In addition, the Section provides professional leadership to the field of educational journalism.

Following reorganization within the past year, the Section staff convened a national advisory group of experts in educational public relations to discuss and make recommendations looking toward a long-range public relations program for the Office. Professional problems were also discussed at the national conference of the American College Public Relations Association and the workshop of the Educational Press Association.

At the request of the Educational Director, Public Information Division of the United Nations, the Section specialists arranged a conference of key editors of educational publications, held in the office of the Secretary-General of the United Nations, to develop a program for presenting factual information about the United Nations to students and teachers in schools and colleges throughout the United States.

During the past year the Editorial Unit of the Section handled a total of approximately 1,000 different items, including 192 separate printing jobs. A total of almost 4,000 separate printed pages were edited, including 30 bulletins, 10 issues of *School Life*, and 18 issues of *Higher Education*. In addition, Part 4, Educational Associations and Direc-

tories, of the *Educational Directory* was prepared.

The U.S. Office of Education Library continued to serve its usual clientele of Office specialists, research workers, and personnel of other government agencies. During the past year the 8,000 publications added to the library increased its holdings to approximately 325,000 items. Progress on the acquisition of needed foreign educational literature was made during the year, particularly through the services of the State Department.

**International Educational Relations.** The Division of International Educational Relations has as its objective the development of better international understanding and cooperation. During the past year the Division continued to administer the Exchange of Educational Personnel Program under the Buenos Aires Convention for the Promotion of Inter-American Cultural Relations. In addition, the Division again carried on the selection and notification of 96 teachers of Spanish from our schools who attended the Spanish Language Institute of Mexico City.

During the past year the Division cooperated with the State Department in setting up the program for the interchange of teachers between Great Britain and the United States. Under this program, administered by the Division, 74 teachers from the United States changed positions with 74 teachers from Great Britain.

During the year, the preparation of studies of educational systems in Central and South America, under the sponsorship of the Inter-departmental Committee on Scientific and Cultural Cooperation, was continued. Final reports were completed for Colombia, Chile, Ecuador, El Salvador, Guatemala, Haiti, Nicaragua, and Peru. Field work was done in Panama and Venezuela. Preparation of a report on Brazil was continued.

Requests from teachers and the lay public for materials relating to countries outside the United States, UNESCO, the United Nations, and international relations generally, continued to be exceptionally heavy during the past year. In an effort to meet these demands the loan packets service on Latin-American countries was revised and enlarged. At present packets for 20 subject fields have been developed. Last year about 3,000 of these packets were sent to teachers free upon request, except for return postage. Similar packets on Far Eastern countries were prepared.

Consultant services developed significantly during the year. Ten members of the Division staff served as speakers and consultants to more than 100 university, college, and professional meetings, institutes, conferences, and workshops in the United States. In addition, various members of the staff served in the following capacities: technical expert, United States delegation to United Nations Education, Scientific, and Cultural Organization, London; United States representative on Education Committee, UNESCO, London; United States delegate, Ninth International Congress on Public Education, Geneva, Switzerland; member of Education Mission to Japan; consultant to War Department, U. S. Military Government, Germany; consultant to War Department on selection of educational personnel in occupied areas; consultant services to the Korean Educational Mission sent to the United States by the U. S. Military Government in Korea; and services as observer-advisors to the World Conference of the Teaching Profession at Endicott, N.Y.

The number of requests for the evaluation of foreign credentials reflected an increasing utilization of our schools and colleges by foreign students.

During the summer of 1946 there were three times as many requests for evaluation service as there were during the preceding period of 1945.

**Auxiliary Services.** The Service to Libraries has collected and made available such data as "College and University Library Statistics, 1939-40" and "Statistics of Public School Libraries, 1941-42." The latter, distributed in the fall of 1945, was employed by State supervisors of college libraries to help raise standards of service, by school accrediting associations to assist in revision of standards for members, and by publishers to determine potential markets for children's library books.

Bibliographical services included a listing, "500 Books for Children," prepared at the urgent request of elementary school principals, a selected list of significant government publications for use of librarians and teachers and a compilation of books and periodicals for use of the Korean Education Commission in stocking a teacher's library. Consultative and informational services were rendered by specialists, and cooperation was maintained with State and national library associations.

The Educational Uses of Radio Section received during this fiscal year twice the volume of requests for program materials and for services of advice and consultation than were received during the last fiscal year. Indicative of increasing use of radio in education is the fact that 70 new educational-program scripts were placed in circulation through the script exchange and that 50 additional Transcription Exchange programs were made available to educational institutions.

**School Administration.** The Division of School Administration provides technical leadership in the fields of school organization and administration, school finance, pupil transportation, school legislation, and school housing. During the past year the work of the Division's specialists involved activities of which the following were typical: Analyzing and presenting information on all aspects of school administration; services for and participation in State, regional, and national conferences dealing with school administration; conferences with chief State school officers and visits to State departments of education; preparation of reports for professional publications; and consultative services to lay organizations interested in school administration.

During 1946 the U. S. Commissioner of Education and the director of the Division met frequently with the officers and executive committee of the National Council of Chief State School Officers and acted as consultants on many problems.

The Division's specialist on school finance issued a pamphlet on "State Plans for Financing Pupil Transportation," and a leaflet on "Federal Government Funds for Education."

The Division's specialist on pupil transportation participated in a conference which resulted in new national school bus standards, now rapidly being adopted by most of the States. During the year the Office published a pamphlet, "School Bus Drivers—Current Practices in Selection and Training." The Division performed two special services in order to keep the States informed of the developments in pupil transportation: (1) maintained the practice of sending State supervisors of pupil transportation current information on developments; and (2) initiated a loan packet service for supplying materials related to 18 different problems in pupil transportation.

The Division specialist on school legislation was called on more than in any previous year to give information and guidance to organizations interested in Federal legislation affecting education,

There was a heavy demand for the consultative service of the school plant specialist. State and local school authorities, greatly concerned that many school plants are obsolete and inadequate, looked to the U.S. Office of Education for leadership and guidance in planning building programs. Division specialists directed or participated in many State and regional surveys and school plant conferences. One staff specialist served as chairman of the Standard Committee of the National Council on Schoolhouse Construction for the preparation of a "Guide for Planning School Plants," a bulletin designed to guide educators and architects in the planning of educational plant facilities.

JOHN W. STUDEBAKER.

**EGYPT.** A kingdom in the northeastern part of Africa. The ruler in 1946 was Farouk I, who succeeded to the throne on Apr. 28, 1936. The total area of the country is approximately 386,198 square miles. Most of this, however, consists of desert, the habitable area in the Nile Valley and nearby oases comprising only some 13,600 square miles.

**Characteristics of the People.** The estimated population in 1943 was 17,423,000—and is growing rapidly. The population of the three largest cities was: Cairo, 1,312,096; Alexandria, 685,736; Port Said, 124,749. The great mass of the population professes Islam. There are, however, approximately one million Copts and Greek Orthodox, in addition to some 80,000 Protestants, 130,000 Latins and Uniates, and 65,000 Jews. Egypt is the seat of the Coptic Church, to which the Christian population of Ethiopia also adheres (see ETHIOPIA). The great center of Moslem learning is the University of El Azhar in Cairo, to which students come from all over the Islamic world. According to law, education is compulsory for all children from seven to twelve years of age, though this rule is not rigidly enforced. The Government provides more educational opportunities for girls than do most other Moslem countries. There are fifty secondary schools supported by the Government, as well as eighty-one private institutions. Technical education is furnished in over fifty schools. There are also two state universities: the University of Fuad I in Cairo and the University of Farouk I in Alexandria. There is also an American University in Cairo. Arabic is the official language, and is spoken by most Egyptians. French and English are widely understood among the educated classes.

**Government.** The monarchy is hereditary in the male line. The present constitution, originally promulgated in 1923, was reintroduced in December 1935 after having been abrogated in October 1930. The Parliament consists of a Senate and a Chamber of Deputies. Two-fifths of the members in the former are appointed by the King, the rest being elected for ten-year terms. The 264 deputies are elective. Universal male suffrage prevails. The Council of Ministers is appointed by the King but is responsible to Parliament—a somewhat anomalous constitutional situation that has given rise to complications.

Egypt proper is divided into five governorships and fourteen provinces. In addition, there are the extensive outlying desert areas, inhabited largely by nomads. Certain matters involving personal status are still subject to the jurisdiction of religious courts. Other cases involving Egyptians are decided before the national courts. By the Convention of Montreux of Oct. 15, 1937, the system of Mixed Courts was scheduled to disappear in October 1949. After that date foreigners in Egypt will be

was persuaded to try again and by October 3 he was heading the ministry once more. He proposed that negotiations be transferred to London, where he arrived on October 17. After several candid conversations with Mr. Bevin, he returned to Egypt on the 22nd. Upon his return he made certain statements concerning those conversations which were challenged in London. On the 28th Mr. Attlee told the Commons that Britain had made no new commitments, particularly in regard to the Sudan. This apparent misunderstanding made Sidky's position difficult among his colleagues. On November 1 he told them that Britain had agreed to Egyptian sovereignty over the Sudan but that the status quo there would continue until the Sudanese could choose their own form of government. Britain had also promised, he reported, to withdraw completely from Egypt within three years. On Nov. 10 he defended these terms as fulfilling all of Egypt's aspirations, and in an interview on the following day he pointed out that the British were already building bases in Palestine, Cyprus, and Kenya to accommodate forces being evacuated from Egypt.

In the Speech from the Throne, opening Parliament on November 14, Farouk declared that the British had agreed to evacuate Cairo, Alexandria, and the Delta within five months. As for the questions of the Sudan and the military alliance, he expressed hope that here too success might also crown the negotiations. The British, in preparation for their imminent withdrawal from the cities of Lower Egypt, were building temporary cantonments and headquarters in the desert near the Great Bitter Lake in the canal zone. By November 27 the Royal Navy had evacuated Alexandria, for many years its principal base in the eastern Mediterranean.

Though some of the Egyptian treaty delegates opposed certain points in the draft, the Deputies gave Sidky's government a vote of confidence of 159 to 0 (over sixty abstentions) on November 26. But through ill health, he was obliged to resign on December 8, still maintaining that he had not agreed in the "Sudan protocol" to let that country enjoy the right of secession (see *ANGLO-EGYPTIAN SUDAN*). Sidky was succeeded by Nokrashy Pasha, who likewise insisted on the "unity of the Nile Valley" but promised to do his best to come to terms with Britain. Conversations were resumed at the end of the year, but with no immediate hope of success.

**Relations with Other Countries.** On June 15 it was announced that Egypt had agreed to buy from the United States the remainder of the vast supply of surplus military goods in the country for around \$10,000,000. John H. Payne Field, one of the largest air fields in the Middle East, was to be presented to Egypt in return for the latter's agreement to an air pact with the United States. Cairo consented to designate Payne Field as an international airport and to let the Americans operate it until December 15 in order to train Egyptian personnel. There was also an exchange of commercial aviation privileges, by which the American T.W.A. firm was allowed to operate planes into Cairo.

Premier Sidky revealed on July 25 that the Arabian-American Oil Co. had agreed to extend its proposed pipeline from Saudi Arabia to a terminus in Egypt. The United States and Egypt announced on September 15 that they were raising their diplomatic missions to each other from the rank of legation to that of embassy.

Ex-King Victor Emmanuel III of Italy and his wife arrived in Alexandria on January 12 to take up their exile as guests of King Farouk. On Sep-

tember 29 ex-King Simeon, youthful grandson of Victor Emmanuel, also reached his Egyptian exile, accompanied by his mother. It was learned in Paris on September 11 that Italy would pay Egypt reparations to a value of ££6,500,000.

Egypt served during the year as an elected member of the United Nations Security Council. Its delegate, Hafez Afifi Pasha, functioned as President of this body for the month beginning April 17.

Egypt also continued to take a leading part in the Arab League, whose new headquarters were opened in Cairo on January 16 (see *PAN ARAB AFFAIRS*). The visit of King Ibn Saud during the same month helped materially to strengthen the bonds of Arab brotherhood (see *ARABIA*). In June the Grand Mufti of Jerusalem escaped from France and soon thereafter turned up in Egypt. He asked asylum of King Farouk, which was granted to him on the reported understanding that he eschew political activities embarrassing to Egypt during the delicate negotiations with Britain. However, it was not long before the Grand Mufti was intriguing over Palestine and Pan Arab affairs from his villa in Alexandria (see *PALESTINE; PAN ARAB AFFAIRS*).

**Domestic Affairs.** The country's internal politics were closely connected with the course of Anglo-Egyptian relations. The Wafdists, out of power, sought to make political capital out of the natural anti-British sentiment of the masses. The government was thus constantly being harassed by demonstrations and riots, stirred up by the Nationalists, and these events in turn reflected unfavorably on the negotiations with Britain.

On January 5 Sir Amin Osman, former finance minister and friend of Britain, was assassinated, and his funeral on the following day became the occasion of a student demonstration against the Nokrashy government. By the end of the month the continuance of the latter in office was undermined by the threat of the three Independent Wafdist, or Kotla, members to resign, over the question of whether or not Egypt should take her dispute with Britain before the Security Council. The King prevailed upon the three dissidents to withdraw their resignations. But the internal situation deteriorated, with student riots against Britain breaking out in Cairo on February 9 and spreading elsewhere, with a loss of at least nine lives. The three ministers resigned on the 13th, followed by Nokrashy himself on the 15th. He was succeeded by Ismail Sidky Pasha, who had been Prime Minister early in the '30's. By the 17th he had a cabinet composed of five Constitutional Liberals and seven independents, administrators rather than politicians. It thus had the direct support of only one party in the Chamber, with 90 out of 250 seats; yet it was accorded a vote of confidence on the 18th. The next day Sidky told the Chamber that he desired complete independence and unity for the Nile Valley and would wage war on ignorance, disease, and poverty. The King was also known to be much interested in improving the economic and social conditions of his subjects. As a result of the war, prices were inflated; yet growing numbers were jobless—as many as 325,000 by early summer. This was partly caused by wholesale discharge of employees by the British as they cut down their military, aerial, and naval establishments in the country. In any event, the British served as convenient scapegoats against whom the unrest of the populace and the students could be turned.

During riots in Cairo on February 21 mobs attacked the R.A.F. barracks, destroyed parts of the Anglican Cathedral and a Catholic Church, and

managed to bring about the death of at least twenty persons. Sidky forbade further meetings and blamed the disturbances on the aggressive acts of British soldiers. The British government denied this and demanded reparations. March 4 was observed as a day of mourning for the victims of February 21, with further riots in Alexandria, where seventeen were killed and some 300 injured. Though Sidky showed real determination to restore order, there were other outbreaks, such as the fatal bombing of a theater in Cairo on March 10.

Violence continued spasmodically during the spring and early summer. A new note was introduced on July 8 when the government rounded up seventy alleged Communists and Left-wing Wafdists. On the following day it was revealed that the Cabinet had prepared new provisions for the Civil Code in order to deal with propagandists urging the overthrow of the established regime and with those who got funds from abroad. These articles were promulgated on the 10th. The very same day police seized around a thousand persons, mostly young intellectuals but including a number of Wafd and other political leaders, several foreigners, and even a few capitalists. Fifty women were among this motley crew, who were supposedly charged with seditious, even Communist, activities. The organ of the Wafd, *Al Wafd Al Misri*, was suspended and its editor arrested. In this way the authorities forestalled a general strike, called for the 11th on the anniversary of the British bombardment of Alexandria in 1882. On the 13th the Cabinet dissolved eleven educational, cultural, scientific, social, and labor organizations, including all the branches throughout Egypt of the Labor Union Congress.

The sequel to this "Red scare" was an anticlimax, for most of the arrested persons were released without formal charges filed against them, while several of the closed associations were again operating by the fall.

The weakness of the Sidky Cabinet eventually led to its reform on September 12 by the addition of Saadist members. As before, there were no Wafdists, and Makram's Kotla Party had withdrawn. Nevertheless the government represented a majority in Parliament. Another crisis was precipitated later in the same month when Anglo-Egyptian treaty negotiations bogged down once more. Sidky resigned on the 29th, but his mandate was renewed on October 3.

November 13 was National Struggle Day and was marked by riots and demands by the Wafd for a revolt against continued British occupation and for the resignation of Sidky. New outbreaks began on the 23rd and continued for several days. Sidky closed the Fuad University in Cairo indefinitely, banned public meetings and promulgated other repressive measures—aimed primarily at the Wafd, which he accused of plotting insurrection. The replacement of Sidky by Nokrashy on December 8 and 9 (see above) meant no loosening of the press and other gags. The new Prime Minister sternly warned the students against engaging in political activities. He received a vote of confidence—155 to 21—on December 16.

**Social and Economic Reform.** The need for immediate and thoroughgoing reform in the archaic economic and social system of Egypt was universally admitted. The government, spurred by the King, was in fact already moving in this direction, though its primary attention was of necessity fixed on the attainment of complete independence.

In April it was learned that Paul van Zeeland, former Prime Minister of Belgium, had been called

to Egypt to act as consultant on economic problems. On August 15 the government announced plans for selling state lands in small plots and for encouraging, through taxation and other means, the splitting up of large private estates into small parcels. Various other projects, such as the electrification of the Aswan Dam, were also afoot. Symptomatic of the trend was the fact that nearly three-quarters of the Speech from the Throne on November 14 was devoted to social reform.

The earliest flood since 1869 descended upon Egypt from the basin of the Blue Nile and by August 15 the water level at Cairo was the highest on record. The government found it necessary to take drastic steps in order to prevent widespread damage to land and crops in the Delta.

**The Country and Its Economy.** The only part of the extensive area of Egypt that has any real economic value is the Nile Valley. Above Cairo this is quite narrow, but in Lower Egypt it widens out into the fertile Delta. Thanks to the water and the fertilizing qualities of the Nile River this relatively small area has been able to support a dense population for several millennia. It is possible to raise two, or even three, crops a year. During the British occupation the economy of the country was directed into the production of cash crops, such as cotton, rather than foodstuffs. In Egypt the unit of area is the *feddân*, which equals 1,038 acres. In 1944 852,949 *feddâns* produced 4,640,262 *qantârs* of cotton (a *qantâr* is the equivalent of a hundred-weight). In 1942–43, 1,917,422 *feddâns* were put into wheat, 418,947 into barley, 381,010 into beans, and 19,114 into onions. In 1943 there were 1,950,957 *feddâns* of corn, 729,106 *feddâns* of millet, and 642,121 *feddâns* of rice. In 1943 the country possessed 30,896 horses, 826,796 donkeys, 1,202,284 cows, 1,100,124 buffaloes, 1,423,772 sheep, 759,794 goats and 174,054 camels. Egypt's oil production in 1943 was 1,284,966 metric tons, and in 1944 some 1,800,000 tons. Explorations have been going on in the hope of discovering larger fields, but thus far with only modest success.

In 1945 Egypt's imports were valued at £E59,679,000 and her exports at £E41,630,000. Her trade with Great Britain, as regards both exports and imports, was greater than that with any other country.

The Egyptian railway system comprises some 2,750 miles of main line in addition to nearly 1,000 miles of light railways. Egypt has been united by direct rail communications with Syria and Turkey since the British Army completed building the 175-mile line between Tripoli (Lebanon) and Haifa during the war. The rivers and canals of Egypt are extensively used for transport.

The country enjoys a strategic location along some of the world's principal air routes, which connect the three continents of the Eastern Hemisphere. The Suez Canal passes through Egyptian territory but is subject to a special regime (see SUEZ CANAL) and is owned by a French corporation. According to the terms of the concession under which the Canal was constructed, it is to revert to the Egyptian Government in 1968.

ROBERT GALE WOOLBERT.

**EIRE. (Ireland).** A sovereign, independent state, affiliated for certain purposes with the British Commonwealth of Nations. Eire includes the twenty-six counties of Southern Ireland formerly designated the Irish Free State. The name was officially changed to "Ireland" in English and to "Éire" in Gaelic. Area, 26,601 square miles. Population (1946 census): 2,953,452. Capital: Dublin.

**The People.** Almost all (94 percent) of the people belong to the Roman Catholic Church, with the remainder divided among Episcopal, Presbyterian, Methodist and other churches. Primary education is directed by the State, and there is almost no illiteracy. The Irish language is taught in all national schools. There are two universities, with an enrollment in 1945-46 of 6,310 students.

**Government.** Under the Constitution proclaimed December 29, 1937, there is a President elected by popular vote for 7 years. The Oireachtas (Parliament) includes two houses: the Dáil Eireann or House of Representatives of 138 members and the Seanad Eireann or Senate of 60 members (43 elected on a vocational basis, 6 elected directly to represent the universities, and 11 nominated by the Prime Minister. Executive power is exercised by the Government, or Cabinet, which is responsible to the Dáil. The President, Sean T. O'Kelly, was elected in 1945 to succeed Douglas Hyde, the first President of Eire, who held office from 1938 to 1945.

The Prime Minister, Eamon de Valera, who also serves as Minister for External Affairs, is the leader of Fianna Fáil (the Government Party), to which position he was unanimously reelected on October 8, 1946. At the time of the last general election (May, 1944), Fianna Fáil had 76 seats in the Dáil; Fine Gael (United Ireland Party), 30; Farmers, 12; Labor, 8; National Labor, 4; and Independents, 8, out of the total 138 seats.

**Events, 1946.** The postwar reconversion period was not an easy one for Eire, although the country's relatively plentiful supplies attracted thousands of English tourists for whom home conditions were much more austere. Coal from Britain had become more expensive and scarcer, so steps were taken to develop Eire's native peat. The cost of living in Eire rose more swiftly and steeply than Britain's, while wages lagged. Rains during the harvest season were destructive and at the end of the year it appeared that bread rationing was in sight.

The country was plagued by strikes for most of the year. The rapidly rising cost of living, in view of the low wage and salary levels, was the cause in most instances. The best-known strike was that of the teachers in the Dublin elementary schools, who were away from their posts for many months, but serious dislocations occurred in industry as well. Farm laborers struck for higher wages in March, sugar workers at the end of the year; and in nearly every major industry strikes had occurred or were threatened for 1947. Prime Minister de Valera warned his party at a Dublin meeting in December that the setting of one group against another had already produced a serious situation for the Irish community.

Another domestic difficulty was the persistence of the activities of the underground extremist movement known as the Irish Republican Army (IRA). In May one of the IRA men who had been kept in internment camps during and after the war died as a result of a hunger strike. The Prime Minister then made a public statement to the effect that the Government could not be coerced by hunger strikes or other means to release men who usually then engaged in further plots against the state.

**International Relations.** In his speech in recognition of his reelection to the leadership of Fianna Fáil in October, Prime Minister de Valera appeared to reverse an earlier position when he proclaimed his allegiance to the British Commonwealth, saying that the association of the Irish Republic with

the Commonwealth had practical values. The Prime Minister was obviously replying to criticisms of the functions of the President, Sean O'Kelly. He reminded his hearers that the presidency was defined by law and that certain symbols of Commonwealth recognition provided by Eire law had been accepted by the Irish people.

At the final meeting of the interim council of the Provisional International Civil Aviation Organization (PICAO) in Montreal in June, Dublin was chosen unanimously as permanent headquarters for the North Atlantic regional office. A PICAO conference on North Atlantic air routes had met in Dublin in March, and the region's strategic position was apparent. In April announcement was made of the formation of an Anglo-Irish air transport company to provide service between Eire and the United Kingdom, and Eire and the Continent. The new company was to be owned 60 percent by Aer Rianta, an Irish company, and 40 percent by British Overseas Airways Corporation.

On July 25 the Dáil unanimously approved Prime Minister de Valera's motion that the Eire Government be authorized to become a member of the United Nations. This decision was communicated to the acting Secretary-General of the United Nations by cable immediately. Russia expressed opposition in the Security Council, and admission was not achieved in 1946.

**Agriculture and Industry.** Agriculture is very important in the Irish economy and a fruitful source of exports, especially to Great Britain. Wheat, oats, barley, rye and potatoes are the leading crops. Stock raising, manufacturing and fishing are also important.

Industrial production is varied, but brewing (£11,837,000 in 1944), tobacco (£11,736,064) and grain milling lead the list. In general the industries with the largest value of output are concerned with the processing of food, although clothing and woolen and worsted manufacture are also large.

**Foreign Trade.** Eire's exports in 1945 reached £75,092,000, with more than half of the income furnished by invisible items such as income from investments abroad (£15,000,000), emigrants' remittances (£9,603,000) and pensions paid by the British Government (£4,244,000). Imports, which consisted of a higher proportion of merchandise, were £51,137,000, leaving a balance in Eire's favor of £23,955,000. Great Britain ordinarily takes about four-fifths of Eire's commodity exports but furnishes usually only a little more than one-half of Eire's commodity imports.

Eire has become Britain's creditor to a considerable amount, and since the Anglo-American Loan Agreement requires an attempt to scale down sterling debts there has been some uneasiness in both countries; in Eire, because the political relations with Britain have not been such that the suggestion would be well received, and in Britain because it is understood that few things would harm the gradually improving relations more than a suggestion of repudiating part of Eire's sterling balances.

ALZADA COMSTOCK.

**ELECTIONS.** The Republican Party won control of Congress on November 5 in an overturn of landslide proportions. By gaining 56 seats in the House and 12 in the Senate the GOP took over for the first time in fourteen years. The Republicans received approximately 55 percent of the total votes cast. A tally of the results is shown in the accompanying table on page 199.

## POLITICAL COMPOSITION OF OLD AND NEW CONGRESS \*

State	Old Senate	New Senate	Gain	Old House	New House	Gain
Alabama . . . . .	2D	2D	0	9D	9D	0
Arizona . . . . .	2D	2D	0	2D	2D	0

\* D = Democrat, R = Republican, P = Progressive, ALP = American Labor Party.

In addition to sweeping Congress in a manner reminiscent of the Democratic triumph of 1932, the Republicans picked up three Governorships (Idaho, Massachusetts, and Ohio) and lost one (Colorado) for a net gain of two Governorships. There are now twenty-five Republican Governors and twenty-three Democratic Governors. Significantly the Republicans won 20 of the 34 gubernatorial contests. A tabulation of results shows Republican incumbents reelected in California, Iowa, Maine, New Hampshire, New York, North Dakota, Oregon, Wisconsin, and new Republican Governors in Connecticut, Idaho, Kansas, Massachusetts, Michigan, Minnesota, Nebraska, New Jersey, Ohio, Pennsylvania, South Dakota, and Vermont. Democratic incumbents were reelected in Arizona, Arkansas, Nevada, Rhode Island, Tennessee and Wyoming. New Democratic Governors were elected in Alabama, Colorado, Georgia, Maryland, New Mexico, Oklahoma, South Carolina, and Texas.

Over 34 million votes were cast which was a record number for an off-year election. This total is considerably lower than the 45 million that voted in the Presidential election of 1944, but considerably more than voted in 1942's off-year election when 28 million turned out. The Republicans led with approximately 19 million votes to 15 million. For some unknown reason many of the women Congressional candidates were defeated and the count now stands seven women of which four are Republicans and three, Democrats. Eleven women served in the 79th Congress.

Even more significant was the way the Republi-

cans swept the State Legislatures. Again, comparisons could be drawn with the Democratic rout of Republicans in the 1932, 1934, and 1936 elections. This year the Democrats were almost wiped out in Iowa, Indiana, Michigan, and Oregon, and the Republicans also won in such Democratic strongholds as Montana, Washington, and Utah.

When the ballots were counted the Republicans controlled (except for Rhode Island) the State Legislatures in the New England States, throughout the Northwest, as well as in the Midwest. The Solid South and the Legislatures in such border States as Maryland, Kentucky, Tennessee, and Oklahoma remained in the Democratic column, but both houses in Missouri are now Republican as well as both houses in Idaho and Montana. The House in Washington is Republican and the Senate, which is tied 23-23, was organized Republican by the Democratic Lieutenant Governor who, holding the balance of power, felt that since the State went overwhelmingly Republican, the Senate should be organized Republican despite a few Democratic hold-overs. Other Western States such as California, Colorado, Oregon, and Wyoming continued Republican. The Democrats retained their hold in Arizona and New Mexico. In Nevada the Senate is Republican and the Assembly is split with two Independents holding the balance of power. In Utah the Republicans hold the House and lack one vote of controlling the Senate.

As this is written, it appears that in 28 States both houses of the Legislatures will be Republican and 18 States will have both houses Democratic.

**The Reasons.** Political analysts attribute overwhelming defeat of the Democrats to a variety of causes among them being: widespread desire for a change; general dissatisfaction with the Truman administration; high prices, scarcities, and the inconveniences of controls; strikes and prolabor bias of administration; radicalism, particularly the issue of Communism which seems to explain the disaffection of large blocs of urban Catholic voters; the return of many Negro voters to the Republican fold; and finally the many minor liabilities accumulated by the Democratic party during fourteen years of rule.

Coupled with these factors was the complete collapse of the Democratic political organization, a diverse and multi-engined machine which in former years had been synchronized by the wizardry of its former pilot, President Franklin D. Roosevelt. It will probably be many years before the numerous bits and pieces of this amazing machine can be put together again. Even the great city machines in Chicago, Boston, Kansas City, St. Louis, Cleveland, and Los Angeles failed to come up to Democratic expectations.

Labor, particularly the political influence of the Congress of Industrial Organizations and the Political Action Committee, appeared to be discredited, and it was obvious that large segments of labor (especially members of the American Federation of Labor) voted Republican. Less than one-third of more than 300 Congressional candidates backed by CIO-PAC were elected. Labor publications viewed the election as a "disaster" and the *CIO News* dubbed Election Day in 1946 "Black Tuesday."

**State Proposals.** Over one hundred proposals for amendment of state constitutions and numerous measures for "direct legislation" of the initiative and referendum type were before the voters in November. Proposed amendments relating to veterans and to labor were most numerous. Measures favoring payment of a soldier's bonus were approved in Illinois, Michigan, and Rhode Island; however, at their September election Maine voters rejected a referendum on a proposed bond issue for such a purpose. Illinois voters approved a \$385 million bond issue, funds from which would pay each veteran \$10 per month for each month of domestic service and \$15 for each month of overseas service. A lump sum payment of \$900 would be made to families of veterans killed in service. Michigan also authorized a \$10-\$15 per month payment type of bonus while Rhode Island provided for payment of a flat \$200 bonus to every serviceman.

New Jersey approved a special \$35 million bond issue for veterans' housing and California endorsed a \$100 million bond issue to help veterans buy homes and farms. Texas provided a \$25 million veterans' revolving fund for the purchase of state lands for resale to veterans under favorable conditions. A proposal to make loans to veterans going into business was rejected in California. Louisiana increased its homestead exemption for veterans from \$2,000 to \$5,000 applicable to the years 1947-1952, and in addition Arizona broadened its tax exemptions to veterans.

Low-cost housing for veterans and others was encouraged in New York by amending the constitution to permit an increase in housing subsidies from \$6,250,000 to \$9,000,000 annually. These funds would be used to keep rents down for low-income families. The New York Legislature had previously authorized \$80 million in housing loans.

Voters in Arizona, Nebraska, and South Dakota approved measures outlawing labor's closed shop.

Similar action had previously been taken in Alabama, Arkansas, and Florida. Colorado, Kansas, Louisiana, Oregon, and Wisconsin have somewhat less stringent laws in this category. The Nebraska amendment, which is similar to the others, "prohibits denial of employment to any person because of membership or non-membership in or resignation or expulsion from a labor organization." The amendments have not been enforced pending legislative action in Arkansas and the outcome of Florida's Supreme Court case.

Another measure bitterly contested by labor organizations was the so-called Barnes proposal approved in Massachusetts. It calls for a financial accounting by unions and requires them to make public financial reports. Applying to 2,000 unions, the law will now publicize names and salaries of labor officers and dues, fees, assessments, and other expenditures of unions.

Other propositions which were approved included such miscellaneous proposals as these: Alabama adopted the controversial "Boswell Amendment," requiring voters to read, understand, and explain any specified section of the Federal Constitution to the satisfaction of county registrars. Obvious purpose of the amendment, according to its advocates, was to prevent mass registration of negro voters. Vote on the approval of the amendment was close. At the same time California defeated a Fair Employment Practices Commission proposition. North Carolina approved the standard "Equal Rights for Women" type of amendment and Massachusetts authorized women to serve on juries. California, Michigan, Oregon, Oklahoma, and Utah adopted amendments providing additional financial support for their school systems, but amendments for additional school aid in Nebraska and for the reorganization of the West Virginia educational system were rejected. Wisconsin turned down an amendment permitting the transportation of parochial school children in public school buses.

Oregon proposals establishing a "little Townsend" old age pension system and authorizing the levying of additional taxes for armory construction were defeated for economy reasons. Utah joined Washington in authorizing taxation of federal property under certain circumstances.

A controversial measure for the establishment of a new state forestry board was rejected in Washington while West Virginia was authorizing tax concessions to forest land owners to get them to participate in a state forest conservation program.

Michigan approved an amendment permitting the state to build airports after previously appropriating \$1 million to match Federal aid funds for such construction. Also approved in Michigan was an amendment directing the state to return up to one-third of its sales tax revenues to cities and schools. This is expected to amount to \$60 million annually. Arizona also approved a somewhat similar proposal extending aid to its cities.

Salaries of state legislators were increased in Idaho from \$5 to \$10 per day, but other proposals increasing legislators' salaries or allowances were turned down in Missouri, North Carolina, and North Dakota. The North Carolina amendment lacked less than 1,000 votes of passage out of some 300,000 votes cast. Utah raised the salaries of its judges by modest amounts and a pension plan for state and county employees was authorized in Texas.

The standard anti-diversion of state highway funds amendment which has been approved by nineteen states was adopted in Texas.

Numerous amendments of a minor nature having

to do with the sale of liquor; the regulation of pari-mutuels, dog racing, and the outlawing of slot machines were up for consideration in several of the states including California, Idaho, Illinois, and Massachusetts.

Oregon adopted a variety of proposals including those permitting Chinese to own real estate; restricting commercial fishing in coastal waters; allowing legislative bills to be read by title, and fixing the order of succession in case of death of the governor.

In the interest of electoral reform Colorado amended its constitution to provide for secret ballots and Illinois authorized the use of voting machines in Cook County.

Although New Hampshire voters approved calling a convention in 1947 to amend their state constitution, Illinois voters again rejected the so-called "Gateway Amendment" which would have made it easier to amend Illinois' constitution.

HUBERT R. GALLAGHER.

**ELECTRICAL INDUSTRIES.** The index of production reflecting activity in the electrical manufacturing industries continued through 1946 with a further strong downward trend. The outlook at the beginning of the year had been for a leveling off of the production curve at about half that level for 1946 following its decline from the 1944 wartime peak of about 9 billion dollars. Shortages of critical material and labor disturbances were the two factors which brought down the 1946 record. Shortages included such critical materials as copper, steel, lead, metal castings, nickel, plastics, and other materials required in the manufacture of electric equipment.

Paradoxically, in spite of unsettled industry conditions and the difficulties of obtaining raw materials, the production of electric appliances in 1946 reached a level higher than in any of the preceding 10 years. From practically a shutdown in 1944, the production of electric refrigeration equipment climbed to a new 10-year high. This striking post-war recovery in the production of electrical goods for the domestic consumer may be taken as indicating the strong recovery that may be expected of the entire electrical manufacturing industry, once it can get started. The Federal Reserve Board index of general industrial production also showed a downward trend for 1946 which was continuing downward at the year end.

Taking 1940 production figures as a basic reference index of 100, the production of electrical appliances for 1946 was 163 as compared with 40 for 1945 and 10 for 1944. Other comparable figures are: electric refrigerators 101 for 1946, 13 for 1945, and less than 2 for 1944; miscellaneous electrical materials at 157 as compared with 230 and 305; industrial electrical apparatus at 150 compared with 257 and 358; electric power transmission and distribution equipment at 116, compared with 111 and 330; insulated wire and cable at 132, compared with 115 and 139.

Taking the 1940 figures for the over-all production index for the electrical manufacturing industry as a comparative basis of 100, the 1946 index stood at 179 compared with 254 for 1945 and 360 for 1944. For the same years, the Federal Reserve Board general industry index stood respectively at 131, 163, and 189, compared with population indexes of 106, 106, and 104 respectively. The sales of electricity for 1946 stood at 156, as compared with 162 for 1945, and 166 for 1944. These figures reveal the extent to which production in the electrical manufacturing industry still is very substan-

tially higher than the relative production activity of United States industry as a whole. For example, in 1946 comparative production activity in the electrical manufacturing industry was 54 percent above over-all industry production; for 1945, 65 percent; for 1944, 115 percent, the peak; for 1943, 95 percent; for 1941, 55 percent; for 1939, 13 percent; in 1938, the two were the same, which is approximately the normal condition. The disproportionate expansion in the electrical manufacturing industry under the influence of war-preparation and actual wartime demands, reveals conclusively and dramatically the extent to which electrical equipment and materials of all kinds were essential parts not only of manufactured equipment, but also of the factories required to produce that equipment.

A published listing of the 50 largest United States manufacturing companies included the following electrical manufacturers, listed in the order indicated:

Sixth, General Electric Company, with assets of 913 millions;

Tenth, Westinghouse Electric Corporation, 520.7 millions;

Fifteenth, Western Electric Company, 412.8 millions;

Thirty-second, Allis-Chalmers Manufacturing Company, 250.8 millions;

Thirty-eighth, Radio Corporation of America, 232.7 millions.

Excluding the Western Electric Company, for which no figures were given, the other four of these companies listed 536,221 persons as stockholders.

In wartime Germany, too, the electrical industry including the electric power industry, was a vital and major cog in the war machine. German records have revealed, for example, that 40 percent of the 65 billion kw-hr consumed in 1944 by all German industry, was consumed in producing synthetic oil, calcium carbide, iron and steel products, machinery, aluminum, and magnesium—all vital elements in Germany's war program. To prevent German industry in general, and the electrical industry in particular, continuing with its war-making potential, the Technical Industrial Disarmament Committee for the German Electric Power Industry, of the U.S. Foreign Economic Administration, recommended in its 1945 report (which was not released to the public until 1946) the following five-point program:

1. Immediate reduction of Germany's power capacity to a tentative figure of 9 million kw, necessitating dismantling and removing 13 million kw of generating capacity and electric power transmission facilities, and the establishment of an administrative organization, responsible to the Allied Control Council to supervise operation of the remaining electric utility and manufacturing industries.

2. Strict limitation of German export of electric energy as reparations to a temporary period, as continuance of such practice would tend to build up the German power industry and increase German dominance over nearby customer nations.

3. Administrative control of the German power industry for an undetermined period, to prevent expansion of generating and power handling facilities above the requirements of peacetime pursuit.

4. Inclusion in the peace treaty of a clause prohibiting expansion of Germany's electric industry above the level required for her peacetime economy, and that level to be reviewed periodically by an appropriate international enforcement agency.

During the summer of 1946, the U.S. War De-

partment announced a contract with the General Electric Company for atomic energy research and development, including the transfer of responsibility for operation of the \$47 million dollar Government-owned atomic plant at Hanford, Wash., from the I. E. du Pont de Nemours Company effective September 1, 1946, the Government retaining ownership of the plant. Competent authorities made public statements to the effect that "it is only a matter of time until industrial power will be obtained from nuclear energy, although the 'how' and 'when' remain to be answered, and involve both engineering and major economic factors." Most seemed agreed, however, that perhaps as little as 5 years' time would see nuclear power plants furnishing energy for ship propulsion, especially naval vessels where the bulk and weight of conventional power-plant equipment and fuel are critically important. Presumably, nuclear sources would furnish the heat energy which would be used for the generation of electric power for ship propulsion, auxiliaries, and services.

Electronic equipment, including some of the wartime radar principles and equipment, are finding an ever-widening field of application in all branches of American industry from aviation and air navigation to the printing industry where it is used, among other things, to actuate controls to assure accurate register.

The wartime development and application of magnetron tubes, for radar and other purposes, has been followed up by the further development of these tubes for industrial use to supply frequencies of the order of 1,000 megacycles. Industrial heating equipment using these tubes was developed for use in the plastics industry and for other applications of dielectric heating. Included in the applications of high-frequency heating are surface hardening, annealing, brazing, and soldering.

Developed and utilized during the war, for the inspection of ordnance and other equipment, the 2-million-volt industrial X-ray equipments were being turned to peacetime purposes. One such unit originally intended for the production inspection of forgings for jet-propulsion equipment now is being used for the production inspection of castings of steel and other high density metals of complicated shape and of thicknesses varying from  $\frac{1}{4}$  inch up to 12 inches. To provide automatic inspection of metal products photoelectrically, production of machines which automatically inspect the quality of conveyorized products passing between an X-ray tube and a fluorescent screen was announced. With such a machine, any variation in the amount of radiation coming from the screen as a result of flaws or foreign matter in the products under inspection causes the operation of a photoelectric cell, which in turn puts into operation a device which ejects the faulty article and puts a squirt of paint on it marking it as defective.

Preparations were announced for the production of Betatrons, in the 50-million-volt class for therapy and the 10-million-volt class for industrial inspection purposes. The year also saw the development and production of several new types of electro-medical equipment; one of these was a new germicidal ultra-violet lamp especially designed for the disinfection of air in hospital, and similar institutions. Another unit was an ultra-violet lamp intended for nonprofessional use, by patients under physicians' prescription and supervision. An aid to medical science, which found widespread use during the war as a means of locating quickly and exactly the position of foreign objects in the human body, was made available for civilian use. Known

as the Berman Locator, the device operates on the basis of audible signals which increase in pitch as the probe or locating instruments approach the foreign object being sought—suggestive of the wartime mine detector.

In the field of plastics, silicones are rapidly assuming a position of major importance. Silicone plastics are derived from silica, whereas the other widely used plastics are derived from carbon. Silicone plastics lend themselves to production in various forms ranging from silicone "rubber" to compounds of flint-like hardness. Since these plastics can withstand high temperatures that would destroy other plastics, they seem to offer enormous possibilities in the field of electrical insulation. The temperature-resistant qualities of silicones, together with their utter imperviousness to moisture and all liquids except special solvents, led to the wide wartime Navy demand for this material, and the resulting special research expedited its development. Silicone-treated greases and other lubricants have been demonstrated to have enormously long life and to retain their full lubricating qualities in both low- and high-temperature conditions that would destroy the desired qualities of ordinary lubricants.

The 100-million-volt X-ray machines, technically known as induction electron accelerators or "Betatrons," announced in the 1946 YEAR BOOK as being under development, were under construction at the end of 1946, one for the University of Chicago's Institute of Nuclear Studies, to be used for research on fundamental nuclear physics; the other for the Clinton Laboratories at Oak Ridge, Tennessee, operated as a part of the famous Manhattan District project of the U.S. Army Engineers which developed the atomic bomb. By further development work completed during the year, this same equipment can be made to produce radiation at 160 million volts. Another high-energy electron accelerator under construction in a research laboratory during the year is known as a Synchrotron. This machine increases the energy of electrons by a synchronous radio-frequency field rather than by magnetic induction as is done in the Betatron. When electrons attain energy above one or two million volts, they travel at practically the velocity of light and further driving impulses increase their mass but do not appreciably increase their velocity. In the Synchrotron, a magnet is used to bend fast electrons on a circular path within a doughnut-shaped vacuum tube. As the electrons circulate at practically constant velocity, their energy is increased as they pass through a resonant cavity which is energized by a radio frequency oscillator.

Another new atom-smashing device is known as the Linear Accelerator, an outgrowth of wartime work on radar. Radar development supplied the understanding of conduction of electric waves through hollow guides or "pipes," and promoted the development of tubes for the production of microwave radio energy at high power levels. One form of the linear accelerator employs a hollow tube energized by a very high-frequency oscillator. Electrons injected into one end of this waveguide ride the traveling electric wave to the other end and thereby are accelerated to high energies. Either electrons or heavier particles may be injected into the tube and accelerated successfully on their straight paths down the axis of the wave guide.

To expedite the filling of the public requirements for electrical appliances and construction materials during 1946, electrical manufacturers as a rule concentrated upon the quantity production of only slightly modified versions of the 1942 ap-

pliance models which did not require new machine tools or facilities. Consequently, but few new appliances or electrical construction materials appeared during the year. Deep-freeze units for home use began to make their appearance. An electrically heated comforter made its appearance, and the electrically heated blanket announced last year was developed to the point of dual control to accommodate the differing tastes of the occupants of a double bed. A tiny selenium rectifier, to replace the tube-type rectifiers in portable radios, is much smaller and more rugged, and also requires no warm-up period to go into full operation.

Reflecting the services performed by electrically propelled equipment under wartime conditions, the demand for electric motive power in industrial plants, mining operations, and transportation is at an all-time record high level. Local transportation companies purchased more electric vehicles in 1946 than in any previous year. Railroads have been installing electric propulsion equipment at a rate exceeding 1.5 million horsepower annually. In general, electric transportation equipment has increased during the past six years at about three times the rate of preceding years. The trend of development in electric locomotives has been in the direction of greater horsepower per locomotive unit and considerable increase in power output per pound of weight. Four twin-unit 6,800 horsepower all-electric locomotives were nearing completion for the Virginian Railway for coal and freight haul over mountainous territory; under construction were two all-electric locomotives for freight and passenger service on the Cascade tunnel section of the Great Northern Railway, rated as the largest single-cab locomotives to be built thus far, with a capacity of 5,000 horsepower each. In South America and Europe there has been tremendous expansion in railroad electrification, and much of the motive power and other equipment is being made by American manufacturers.

Diesel-electric locomotives for mainline railroad service as well as for switching and yard work were greatly increased in numbers. Claimed to be the largest in actual operation was a new 3,000-horsepower single-unit Diesel-electric locomotive on the Seaboard Air Line Railway. Diesel-electric locomotives are finding rapidly increased usage in steel mills and other large industrial plants and mines.

Of the 5,737 electric trolley coaches operating or on order for transit companies in the United States as of September 1, 1946, some 28 percent or 1,620 of them represented orders placed during the first eight months of 1946. Electric drive, control, and braking equipment for trolley coaches has been improved. Another important element in local transportation facility is the modern all-electric "PCC" street cars. The "PCC" refers to a special conference committee of transportation utility executives which in the 1930's got together and drew up a standardized design for a vastly improved and generally modernized trolley car for urban use, which became known as the "President's Conference Committee Car." Initially these cars carried some pneumatically operated equipment. The first all-electric car appeared in 1940, and now the all-electric car utilizing electric power for all braking and other operations have become standardized in the industry. As of September 1, 1946, some 1,553 of these cars were in operation or on order. Electric equipment for new subway cars now is reflecting the influence of the highly successful lightweight PCC cars.

New electrical equipment for the metals industry

is typified by the drive and accurate control and other automatic equipment being applied to a new cold-rolling-strip mill designed to roll steel sheet and strip at speeds of some 4,000 feet per minute, an enormous increase over the prewar figures. The non-ferrous industry is rapidly expanding, too, as represented by new 48-inch single-stand mills for rolling aluminum; two aluminum-foil rolling mills designed to deliver metal of the thickness of tissue paper at 1,500 feet per minute; a new five-stand tandem hot-strip mill for rolling aluminum driven by a total of 18,500 horsepower in five motors; a 3,200-hp single-stand brass rolling mill. Processing equipment for metal finishing is typified by new continuous strip plating of the electrolytic and hot-dip varieties. One combination annealing and galvanizing line will use a combination high-frequency and resistance-heating furnace with five independently adjustable cooling zones. New zinc-coating production lines will use copper-oxide rectifiers for low-voltage power for electroplating the zinc, in contrast to the ordinary hot-dip process. In the petroleum, chemical, printing, and other industries, new drive and control equipment featuring electronic devices is developing very rapidly.

During the war, one of the invaluable aids in assembling such precision instruments as bomb-sights and binoculars, was the "Precipitron"—an electrostatic air cleaner capable of removing up to 90 percent of airborne dust and dirt particles, including particles as small as those which constitute cigarette smoke. In 1946 the first production models of this device, redesigned for home use, were moving off the assembly lines.

Preliminary engineering and design work was started on four of the most powerful single-unit alternating current motors yet to be built, rated at 65,000 horsepower. Each motor is expected to weigh some 325 tons, the rotor alone weighing 172 tons. Each motor is to drive a pump capable of putting 607,000 gallons of water a minute through an 850-foot-long tunnel, enough water to supply the requirements of a city of the size of New York.

G. ROSS HENNINGER.

**ELECTRIC LIGHT AND POWER.** Once again, the statistics of the industry as published at the end of the year indicate that the figures representing the United States production of electric power constitute a consistent general index or barometer accurately reflecting the underlying state of industrial economic health. As the production curve of industry as a whole receded from the 1945 level both in total production and in rate of production because of the cumulative result of the wave of strikes, electric power production increased somewhat from its 1945 total and at the year-end definitely established a new all-time high record in weekly rate of electric power production that exceeded by some two percent the 1943-4 wartime weekly output peak.

**Production.** Electric power production for 1946 totaled approximately 223.3 billion kw-hr, thereby inching above the final verified total of 222.5 billion kw-hr for 1945. This increase, in spite of the relatively flat power-production curve for most of 1945-46, was accounted for by the substantial increase in the rate of power output at the end of the year. The rapidly expanding rate of electric power utilization by small individual rural and urban customers for farm and household light and power accounted for a total sufficiently great to offset the substantial drop in industrial utilization.

The percentage of total 1946 electric power pro-

duction contributed by fuel-burning plants amounted to 65.3 as compared with 63.8 for 1945 and 68.7 for the wartime peak of 1944. Correspondingly, the percentage contributed by hydroelectric generating plants were 34.7 for 1946, 36.2 for 1945, and 31.3 for 1944. In round numbers, privately owned electric utilities produced in 1946 approximately 81.2 percent of the United States total, about the same as in 1945; federal-government-owned projects turned out about 12 percent, and local-government-owned utilities about 6.8 percent. Behind the screen of these general figures, however, the best available year-end statistics indicate that, small as it was, the actual increase in 1946 over 1945 from Government plants (430 million kw-hr) amounts to four times the percentage that is represented in the 398 million kw-hr 1946 increase over 1945 reported for private utilities. Statistics representing this changing relationship in the source of electric power during relatively recent years are given in Table 1 together with other selected power-production statistics. The jump in "uses and losses" back to nearly the wartime high, principally reflects two factors: one, a heavier demand than in 1945 on fuel burning plants as the result of poorer water conditions and consequent reduction in hydro generation; the other, the conditions arising from strikes. For example, in Pittsburgh, Pennsylvania, the local power company was forced to resort to inefficient means of power production and distribution in order to provide the city with emergency power during the power strike. Also, the interruptions in various manufacturing industries reduced the total use of electric power drastically in many instances, but still required that big power plants be kept in operation in order to furnish such power as was needed.

**Finances.** For 1946, the estimated gross revenue from the sale of electric power in the United States amounted to 3.45 billion dollars as compared with

In homes and on farms, there is a substantial and steady increase in the utilization of electric power. The average residential use rose from 1,229 kw-hr in 1945 to an estimated 1,327 for 1946, the greatest annual increase on record. For this 1,327 kw-hr in 1946, the average customer's bill was \$42.93 representing an average rate of 3.23 cents per kw-hr, a new low point in the continuing unbroken downward trend in the consumers' cost of electric power as delivered to him. This trend is in sharp contrast to essentially every other current market index. Corresponding figures for 1945 were 1,229 kw-hr at 3.41 cents per kw-hr; for 1944, 1,151 kw-hr at 3.51 cents; for 1940, 952 kw-hr at 3.84 cents; for 1930, 543 kw-hr at 6 cents; for 1926, 428 kw-hr at 6.98 cents. For the average 1946 rural customer, the annual bill was approximately \$82.80 for some 3,600 kw-hr at just slightly less than 2.3 cents per kw-hr; this comparing with 2,980 kw-hr at 2.46 cents for an annual bill of \$73.50 for 1945; 2,940 kw-hr at 2.44 cents totaling \$71.80 for 1944; 2,750 kw-hr at 2.55 cents per kw-hr totaling \$70.00 for 1943. A statistical summary of comparative data reflecting electric power sales and related revenue for 1946 and for 1945 is given in Table 2.

Total electric utility financing for 1946 amounted to an estimated \$1,082,447, down approximately one-third from the all-time high of 1945, but still above the billion dollar mark for the fifth time in the history of the industry. New capital accounted for \$172,846,000 of the total; refunding accounted for \$909,601,000. The new capital issues reaching the market in 1946 represented the greatest annual volume since 1931, although the sale of securities for refunding fell behind the all-time record of 1945 by about one-third. Even so, the 909 million dollars of 1946 refunding was directly instrumental in effecting substantial reduction in capital costs, bringing total capital charges for the electric utility industry to a level lower than they have been any

TABLE 1—ELECTRIC POWER PRODUCTION IN UNITED STATES  
(Billions of Kilo-watt-hours)

Year	U.S. Plant Ownership		Energy Source		From	Gross	Uses and	Available

<sup>a</sup> Preliminary figures <sup>b</sup> Revised figures

a revised total of 3.341 billion dollars for 1945, 3.28 billion for 1944, 3.08 billion for 1943, 1.75 billion for 1933 and 1.94 for 1929, the so-called boom year. Noteworthy in the figures reflecting electric power sales to large industrial customers is that during 1945 and 1946 the decline from the 1944 high point was at less than half the rate of the increase which took place under the urgency of war production during the two years preceding the 1944 high point. This is of special significance considering the industrial disturbances which have interfered with normal industrial operation since the war, and would seem to indicate an impending substantial increase if or when industry can get going consistently on constructive production. The 1946 sales of electric power to small light-and-power customers, principally commercial establishments, seem to reflect a resumption of something like the normal annual rate of increase which prevailed prewar, but going upward from a base considerably higher than the prewar base.

TABLE 2—ELECTRIC POWER SALES AND REVENUE

	Total Number of Customers	Sales (millions of kw-hr)	Revenue in Thousands of Dollars
Urban Residential			
1946 <sup>a</sup>	29,743,000	38,400	1,242,000

1945 <sup>b</sup>	34,031,073	193,558	3,341,518
Change	-2,068,927	-2,558	-108,482

<sup>a</sup> Preliminary figures <sup>b</sup> Revised figures

time since 1926, when the electric power output was only about one-third of the 1946 output volume. The 1946 yield of 33 new issues of mortgage

bonds fell to 2.61 percent, as compared with 2.77 percent for 1945; the average yield of 25 issues of preferred stock declined to 3.56 percent, as compared with 3.86 percent in 1945.

Although capital charges went down relatively, other operating expenses advanced rapidly during 1946. For example, labor costs rose to 550 million dollars as compared to 452 million dollars for 1945. This represents an increase in the average hourly earning rate from \$1.19 in 1945 to \$1.27 in 1946, reflecting also the industry's restoration of its working force to more efficient levels, including the expansion of its total employment from 222,000 to 246,000 in direct contrast to the very slight increase in total power production. Approximately a 20 percent increase in the industry's fuel bill, resulting from increase in labor and other costs in the coal mining and transportation industries and adding about 41 million dollars, brought the total fuel bill up to about 424 million dollars. The following tabulation indicates a significant shift during the past 10 years in the nature and trend of the items which account for the average dollar of gross revenue from electric power sales:

	1936	1941	1946
Fuel	8.1	10.1	13.1
Salaries and wages	17.5	16.9	17.1
Other operating expenses	12.1	11.3	13.2
Depreciation	10.3	11.3	9.9
Fixed charges	18.8	12.6	8.3
Taxes	14.7	21.1	18.7
Dividends and surplus	18.5	16.7	19.7
Totals	\$1 00	\$1 00	\$1 00

**Operations.** Fuel consumption for electric power production for the twelve-month period ending October 31, 1946, including coal, oil, and gas, amounted to the calculated equivalent of 89 million tons as compared with a final figure of just under 93 million tons for 1945 and just under 104 million tons for 1944. Continuing the essentially unbroken upward trend in generating plant efficiency, the nationwide average number of equivalent tons of coal burned per kw-hr generated showed an estimated 1.29 for 1946 as compared with 1.30 for the final figure for 1945, and 1.46 for 1935. Details of fuel consumption covering the same period, as released by the Federal Power Commission, were: Coal, 70.16 million tons; oil, 31.17 million barrels; gas, 303.18 billion cubic feet. With this fuel, an estimated total of 145.38 billion kw-hr was generated from a total station capacity of some 35.36 million kilowatts. Corresponding hydroelectric production was 77.95 billion kw-hr from a station capacity of 14.84 million kw. These figures reflect a fuel production of 4,121 kw-hr per kilowatt of fuel station capacity; 5,240 kw-hr per kilowatt of hydroelectric station capacity; an overall average of 4,453 kw-hr per kilowatt of station capacity, representing a load factor of about 50.5 percent.

**Generating Capacity.** Whereas there were some 75 power-plant projects totaling approximately 1.5 million kilowatts of new generating capacity on the year's docket as of January 1, 1946, year-end reports showed that only some 37 projects totaling 361,172 kilowatts actually were completed during 1946. This is the smallest annual installation of new electric generating capacity since the worst of the depression years of the early 1930's, and reflects clearly the effect of materiel and other war-born shortages which continued as the result of strikes and other hindrances to industrial production. As the acute obsolescence of generating equipment, engendered by the wartime necessity of keeping equipment in operation beyond its

normal operating life, required the retirement from service of some 276,000 kilowatts of capacity, only about 25 percent of the meager 1946 capacity represents an actual net increase in electric generating capacity. If a continuation of unsettled industrial or other conditions should seriously interfere with the 3 million kilowatts of new generating capacity scheduled for 1947, the industry's ability to meet load requirements may be impaired. For 1947, about 85 percent of the new capacity planned is in fuel plants and about 15 percent in hydro plants, of which some 85 percent is government-owned.

New electric generating capacity scheduled for 1948 totals some 7.3 million kilowatts of which fuel plants account for approximately 76 percent, and hydro plants about 24 percent of which about 80 percent will be government-owned. As of the end of 1946, the electric generating capacity owned by the government amounted to some 19.5 percent of the nation's total, and this percentage seems destined to grow. In 1930, the government percentage was less than 6 percent.

For 1946, the percentage of electric generating capacity in fuel plants was 70.5 and in hydroelectric plants, 29.5. Corresponding electric power production was respectively 65 percent and 35 percent, representing a slight increase in the proportion of fuel-plant generation in 1946 as compared with 1945. The Government's 19.5 percent of the total United States generating capacity (principally hydro) produced some 22.8 percent of the total electric output.

**Budget.** Industrial conditions brought the expected 900 million dollar 1946 budget down to an actual realization estimated at about 718.17 million dollars, falling short of the record 919 million dollar electric utility construction budget for 1930. Far outstripping this old record is the 1947 estimated 1,307 million dollar budget for the privately owned utility industry, to which some 91 million dollars contemplated for federal Government construction of power production facilities must be added, bringing the gross total to nearly 1.4 billion dollars. The 1947 budget appears to reflect the expectancy of about a 30 percent increase in construction costs.

For 1946 the reported expenditures for new construction were as follows: 191 million for fuel-burning power plants; 19 million for hydroelectric power plants; 107 million for transmission lines and substations; 361 million for distribution lines and substations and 41 million for miscellaneous plant improvements. Corresponding figures budgeted for 1947 are: 449 million for fuel-burning plants; 49 million for hydroelectric plants; 213 million for transmission lines and substations; 525 million for distribution lines and substations and 71 million for miscellaneous plant improvements.

Trends in the development of electric generating capacity are indicated in Table 3. Geographical distribution of the U. S. electric generating capacity as of November 1, 1946 is given in Table 4, from Federal Power Commission statistics. The United States total of 3,858 plants with a total capacity of 50,196,000 kilowatts for 1946 compares with totals of 3,923 plants and 49,902,000 kilowatts for 1945. The drop in total number of operating plants reported reflects the withdrawal from wartime operations of 8 obsolescent hydroelectric and 29 steam-electric plants and the shutdown of some 28 emergency internal-combustion-engine-driven electric generating plants.

Electric power transmission voltages seem to be on the verge of going to still higher levels. Transmission at 220,000 volts dates back to 1930; the

TABLE 3—ADDITIONS TO U.S. ELECTRIC GENERATING CAPACITY

												2,330,500

present high record of 287,000 volts is associated with the transmission of Boulder Dam power across desert and mountain range into the Los Angeles area in southern California. Construction of a section of test line and of necessary associated equipment was well under way in Ohio at the end of 1946, to provide for the experimental transmission of electric power initially at 360,000 volts and ultimately up to as high as 500,000 volts. Utilities and electrical manufacturers are cooperating in this test, for which two 1.5-mile sections of experimental transmission line are expected to be completed and ready for use early in 1947.

**Rural Electrification.** Some 55,400 miles of rural electric power lines were reported as built by privately-owned electric utilities during 1946, some 96 percent of the total amount originally budgeted for the year in contrast with the relative failure of other phases of the intended construction program. Costs reported reflect a median of about 30 percent increase over prewar levels. Comparable figures for construction show the following: 1945, 31,000 miles; 1944, 11,000 miles; 1943, 4,000 miles; projected for 1947, 64,000 miles! The 16 southeastern and southern states account for nearly half of the rural line construction for 1946 and as projected for 1947.

The Rural Electrification Administration reports for 1946 show an average of 1,578 kw-hr for the average REA consumer, as compared with 1,621 for 1945 and 1,668 for 1944. Corresponding average rates were 3.68 cents per kw-hr for 1946, 3.43 for 1945, and 3.31 for 1944. The average REA consumer's power bill for 1946 was \$57.70 as compared with \$55.60 for 1945, and \$55.50 for 1944. The total number of REA operating systems was reported at 872, servicing 1,675,000 customers; revised figures for 1945 were 848 operating systems servicing 1,409,494 customers. A total of 79 electric generating plants were reported for 1946, with an aggregate capacity of 112,847 kw; revised figures for 1945 were 76 generating plants with aggregate capacity of 92,544 kilowatts.

Electric power generated by REA systems for 1946 was reported as 322 million kw-hr as compared with 258.1 million kw-hr for 1945; an additional 2,648 million kw-hr were purchased by REA systems, as compared with 2,343 million kw-hr purchased in 1945. Some 500,000 miles of line were reported to be in operation in 1946, serving an average of four customers per mile, as compared with 449,493 miles of line with 3.15 customers per mile in 1945.

Public funds, representing the United States taxpayers' money, that had been allocated to REA by the end of 1946 amounted to some 957 million dollars, nearly a 50 percent jump over 1945. On the basis of the number of consumers as reported to be served by REA lines at the end of 1946, this amount represents a free allocation of some \$583 of tax-payers' money to each REA customer; private electric utilities have no such access to free public funds, but have to pay interest and divi-

dends on such financing, in addition to paying substantial taxes on the property and equipment involved.

**Government.** Culminating years of litigation, the U.S. Supreme Court in 1946 gave two decisions upholding the long-disputed "death sentence" clause of the Public Utility Holding Company Act of August 26, 1935. The first decision was given on April 1 against the North American Company, upholding the constitutionality of that Section of the Act which requires the limitation of interstate gas

\* Includes both steam and internal-combustion-engine plants

and electric holding companies to a single integrated system located in one geographic area. The other decision was given on November 25 against the American Power & Light Company and the Electric Power and Light Corporation, both of which are holding companies in the Electric Bond and Share Company's holding-company system. This decision upheld that Section of the Act which prescribes that the Government legally can require the dissolution of "useless holding companies." Both decisions were on a six-to-nothing basis, three of the justices abstaining from voting. The "death sentence clause" states that each holding company must be required to "take such action as it shall find necessary to ensure that the corporate structure or continued existence of any company in their holding company system does not unduly or unnecessarily complicate the structure or unfairly or inadequately distribute voting power."

With the last hope exhausted, the larger holding companies submitted to the Securities and Exchange Commission what they called "disintegration" plans beginning 18 days after the April decision and continuing throughout the remainder of the year. At the year's end, the SEC reported that among its 1946 accomplishments was the approving of nine plans submitted by various holding companies "relating to integration, corporate simplification, and reorganization of public utility holding company systems," stating further that its "integration and simplification program is proceeding toward rapid accomplishment."

At the beginning of 1946, Secretary of Interior Harold L. Ickes issued a department policy calling for the provision of steam-electric generating plants

as standby facility for every Federal hydroelectric power plant, hydroelectric generating facilities to be designed and installed "at all possible department projects," extensive electric power transmission systems to be built in every region containing Federal generating stations regardless of the existence of such private facilities. He called also for "active assistance from the very beginning" in the organization of new public power agencies and co-operatives. In March, J. A. Krug took over from Ickes as Secretary of the Interior, and thus inherited administrative responsibility for the federal Government's huge variety of electric power, reclamation, and other projects.

During the progress of the coal strike in the fall of 1946, the federal Government acted to bring wartime "brownout" orders back into effect in those areas where electric power is especially dependent upon coal. The restrictions were lifted at the termination of the strike.

The Tennessee Valley Authority reported that its 1946 net earnings were \$16,214,000. Taking exception to this claim, the Edison Electric Institute, a trade association representing about 75 percent of the privately-owned electric light and power industry, asserted that the reported TVA profit was only a "paper profit" achieved by virtue of book-keeping practices wherein the expenses properly chargeable to electric power development and generation were "sloughed off to other operations." The Institute claimed that TVA actually operated at a net loss to United States taxpayers of \$3,041,000 for 1946, and that its total loss since its inception in 1934 is "almost one hundred million dollars."

G. ROSS HENNINGER.

**EL SALVADOR.** A republic of Central America. Area: 13,176 square miles. Population: 1,896,000 (1943). Capital. San Salvador.

Although much of the country is volcanic highland, there are fairly extensive lowlands along the Pacific coast and in the valley of the Rio Lempa, which cuts across the highlands. The mean annual temperature at San Salvador is about 73 degrees, while the mean annual range of temperature throughout the country does not exceed 50 degrees. Heaviest rainfall occurs between May and November.

**The People.** El Salvador is the most densely populated country in Central America. Inhabitants per square mile range from 87.4 in the Department of Chalatenango to 292.2 in the Department of San Salvador. Mestizos constitute 80 percent and Indians 19 percent of the total population. The largest cities are: San Salvador, 105,000; Santa Ana, 46,000; and Nueva San Salvador (Santa Tecla), 24,000.

Spanish is the official language, Roman Catholicism the predominant religion.

According to the census of 1930, 21.2 percent of the population is literate. In 1941, 89,792 students were enrolled in 1,330 primary schools; 3,309 in 58 secondary schools, and 506 in the National University.

**National Economy.** El Salvador is primarily an agricultural country. Coffee is the principal export crop, but substantial quantities of corn, sugar, beans, rice, cotton, and henequen are raised for domestic use. The 1944-45 coffee crop was estimated at 920,000 bags (of 60 kilograms each), valued at \$22,986,000.

Gold and silver are the principal mineral products of El Salvador. In 1944 gold production amounted to 23,110 troy ounces valued at \$799,-

393; silver production totaled 276,284 troy ounces valued at \$122,645. There is little manufacturing, but a number of small industries are engaged in processing agricultural products, and produce manufactured articles for the domestic market.

**Foreign Trade.** Coffee is the chief export product of El Salvador, which ranks third among the coffee-exporting countries of Latin America. In 1944-45 coffee exports totaled 997,539 bags of 60 kilograms each, of which about 90 percent went to the U.S. Gold and silver rank second in importance in the country's export trade. Other exports are sugar, rice, and henequen sacks. In 1943 coffee represented 87 percent of the value of total exports; gold and silver accounted for 6 percent. The U.S. is the most important market for El Salvador's exports, and took 80 percent of the total in 1943.

The U.S. is the leading supplier of Salvadoran imports, and in 1943 provided 69 percent of the total imports. Manufactured and semi-manufactured products, foodstuffs, and beverages form the major imports of the country.

In 1943 imports amounted to 29,857,429 colones, and exports totaled 56,324,442 colones.

**Government.** El Salvador's Constitution of 1939 provided for a centralized republic of 14 departments, with a unicameral legislature, the National Legislative Assembly, of 42 members. The Assembly met regularly twice a year, Feb. 15 to May 15, and Oct. 15 to Jan. 2. The President was directly elected and was assisted by a Cabinet of 5 members. An amended version of the Constitution of 1886 was adopted on Nov. 30, 1945, to replace the 1939 Constitution. The President is Salvador Castaneda Castro.

**Events, 1946.** During the summer the issue of freedom of the press produced extreme political agitation and forced the resignation of the Supreme Court in El Salvador. After Castaneda Castro won the presidential election in January, 1945, he was bitterly attacked by the National University weekly, *Opinion Estudiantil*. Interior Minister Dr. Benjamin Escobar, who was also attacked, filed suit for libel, and the student editors were convicted and ordered arrested. When the conviction was appealed to the Supreme Court, the verdict was reversed and Supreme Court President Dr. Felix Antonio Gómez acquitted the students.

A few days later Judge Gómez announced that under the Martinez law of 1933, the printers, not the writers of articles, were responsible in libel suits. The sudden judicial turn-about caused a furor as the university students prepared to demonstrate in protest against the Supreme Court. President Castro called an emergency session of the National Assembly on the day of the scheduled demonstration, relieved the members of the Supreme Court and appointed a new Court. The demonstration was carried out without disorder.

On September 13 El Salvador and Guatemala agreed to sponsor an international commission which would draft plans for federating the five Central American republics. The agreement was left open for endorsements by Costa Rica, Honduras and Nicaragua. Once this was accomplished, the commission would begin studies on problems common to Central America. The two signatories emphasized that any agreement would conform to the principles of the Chapultepec Act and the United Nations Charter.

Increasing opposition to the Government, accompanied by a general strike, brought rigid press censorship and a state of siege on September 15. To conciliate the opposition from political groups and university students, President Castro on Sep-

tember 21 dismissed three of his five Cabinet ministers. A few days earlier, in response to a violent outbreak in San Salvador, the President ousted the National Police Director and his deputy. Censorship prevented any news dispatches from El Salvador, but on November 17 it was learned from Guatemala that the President intended to maintain the state of siege until after the coffee harvest, allegedly to prevent any disturbances that might adversely effect the economy.

**EMPLOYEES' COMPENSATION, Bureau of.** This bureau was created within the Federal Security Agency to perform the functions of the former United States Employees' Compensation Commission (abolished by Reorganization Plan II), which were transferred to the Federal Security Agency (Reorganization Plan II of 1946, effective July 16, 1946). The Bureau administers the Federal laws establishing workmen's compensation programs for employments within Federal jurisdiction. Director: William McCauley.

**EMPLOYMENT SERVICE, United States.** After almost 5 years under Federal direction, administration of state and local offices of the United States Employment Service was returned to the 48 states and to the Territories of Alaska and Hawaii on November 16, 1946. Local USES offices in the District of Columbia and Puerto Rico continue under operation of the United States Employment Service, Department of Labor. The Federal government finances operations of the State and Territorial Employment Services 100 percent.

The nation-wide system of Employment Services, established under provisions of the Wagner-Peyser Act of 1933, was federalized in January 1942 to conduct the wartime mobilization of the country's manpower. In July 1942 the USES became the operating arm of the War Manpower Commission, created by Executive Order of President Roosevelt on April 18, 1942. During the war years, and the first 15 months of the reconversion period, the 1,800 local USES offices made more than 50,000,000 placements in American industry and commercial establishments. The full impact of demobilization and reconversion struck the USES offices immediately after the war with Japan ended. Visits to USES offices in July 1945 totaled less than 5,000,000. In March 1946 they totaled 14,499,000. For the fiscal year which ended June 30, 1946, they totaled 128,000,000.

In the early years of its existence the Nation's Employment Service was principally engaged in referring workers to Public Works and Works Progress Administration projects. After 1938, until the Defense and subsequent War Production Programs, its major activities were in finding jobs for unemployed workers and, where this was impossible, in referring them to Unemployment Compensation Bureaus for jobless benefits.

In July 1939, because of this activity, the United States Employment Service was merged with the Unemployment Compensation Bureau of the Social Security Board, and the two became the Bureau of Employment Security. This merger was dissolved when the USES became the operating arm of the War Manpower Commission. When WMC was dissolved by Executive Order of President Truman on September 19, 1945, the USES was returned to the Department of Labor.

As stringencies developed in the defense program and later the wartime labor market, discussions and programs to control hiring, to avoid labor piracy, and to effect a more equal distribution

of the available labor force, were developed. Community control programs on a nation-wide scale came in 1943. Wartime activities of the USES included development of manpower utilization designed to place workers in jobs which would utilize their highest skills and to effectively utilize training and worker-promotion techniques; manpower stabilization plans to exert some control over unorganized migration of workers and labor piracy; and preparation of: (a) A List of Essential Activities; (b) A List of Essential Occupations; and (c) A List of Critical Occupations. Through these measures the manpower resources of the nation were mobilized and distributed where they would be most effective in war production.

The Servicemen's Readjustment Act of 1944 imposed special responsibilities in behalf of veterans upon the USES. These include employment counseling, preferential referral to job openings for which the veteran is qualified, selective placement for disabled veterans, and information service through which veterans are informed of benefits and services available to them through other agencies. These services are available in all offices of the Federal-State Employment Service. They are augmented by Field and National activities of the Veterans Employment Service, a branch of the USES. Policies of the VES are established by the Veterans Placement Service Board, composed of the Administrator of Veterans Affairs, the Director of the Selective Service System, and the Secretary of Labor. These policies are effectuated by the USES.

Organizationally, with return of the state and local office administration to the states, the Employment Service has become a Federal-State system with the Federal government responsible for the promotion and development of a nation-wide system of local employment offices. To achieve this objective the Federal government is obliged to establish and maintain minimum standards for State Employment Service operations; engage in program development for improvement of the services; obtain the best current experience of each state and make it available to all states; provide technical assistance; maintain a uniform reporting system and exchange of labor market information among local offices; review and approve state plans of operation; allocate funds and audit expenditures of monies; and evaluate state operations to determine effectiveness of performance.

Regulations promulgated by the Secretary of Labor, in keeping with provisions of the Wagner-Peyser Act, as amended, and the Servicemen's Readjustment Act, as amended, impose upon the states responsibilities for: Maintaining an effective placement service to facilitate the employment and reemployment of veterans, displaced former war workers, youths entering the labor market, disabled veterans and other handicapped workers, old workers, women, and all other persons seeking jobs; providing employment counseling to veterans and all other workers; providing special services to veterans as required under the statutes; assisting employers and labor organizations, through personnel management services, in the use of personnel tools and techniques developed by the Employment Service for effective selection, assignment, and transfer of workers; disseminating labor market information; and cooperating with community organizations and government agencies in programs for increasing economic activity and maintaining high levels of stabilized employment.

ROBERT C. GOODWIN.

**ENGLAND, Church of.** The year 1946 developed with great importance because of two actions by the Archbishop of Canterbury. The first was his invitation to the leaders of the Free Churches to consider whether they wished to revive the question of reunion as a vital issue so that any proposals they might desire to make could be discussed at the Lambeth Conference of the bishops of the Anglican Communion in 1948. He looked forward to a reunited Church within which the Methodists, Congregationalists, Baptists, and Presbyterians would function with an identity of their own.

The second was a gesture to non-Anglican Churches made by the Primate in a sermon before the University of Cambridge on November 3. In this he suggested that "constitutional union" might be a difficult goal, taking a long time, but that "full communion" might prove easier.

In April an urgent appeal was launched by the Archbishops of Canterbury and York for £600,000 towards the £650,000 required for training those who should be approved among the 5,000 War Service candidates for ordination who had come forward. Up to November 11, £111,182 had been received.

In the closing months of the year the subject of the extreme poverty of the clergy of the Church of England came to dominate all others, as it became increasingly realized that almost all of them were suffering acute hardship and hundreds were desperate. Their already inadequate prewar incomes were not augmented as prices rose; and after World War II the Common Fund of the Ecclesiastical Commissioners (which is the principal source of their stipends) suffered several setbacks. The Government's announced policy of nationalizing transport, with its resultant prospect of reductions in the Commissioners' income from railway stock, also imposed a hardship on the Church's economy.

Other events of the year included important schemes for reorganization in various dioceses including London, where it was proposed to sell the sites of some of the worst bombed city Churches and build new churches in the suburbs; and a pronouncement by the Archbishop of York in a presidential address to the Convocation of York, warning those contemplating "mixed marriages" with Roman Catholics against the danger of signing away the rights of unborn children.

**ENGRAVING AND PRINTING, Bureau of.** A Bureau of the U.S. Department of the Treasury which designs, engraves, and prints the U.S. currency and other engraved work for governmental use. Director: Alvin W. Hall.

**ENTOMOLOGY AND PLANT QUARANTINE, Bureau of.** A Bureau of the U.S. Department of Agriculture, which studies insects that are injurious or beneficial to agriculture and forestry, develops new insecticides and fungicides, etc., and enforces quarantine and restrictive orders issued under the Plant Quarantine Act. Chief: P. N. Annand.

**ERITREA.** An Italian colony on the west shore of the Red Sea, incorporated in Italian East Africa on June 1, 1936, but under British Military Administration since its conquest by Allied forces in 1941.

**The People and Their Economy.** The population of some 700,000 lives in an area of 15,754 sq. mi. though they tend to congregate on the central plateau, where the climate is cooler and moister. On this plateau live the Christian (Coptic) element, racially and linguistically akin to the Ethiopians.

In the lower regions dwell various peoples, largely Hamitic and Moslemized. In the cities and towns on the coast Arab communities are found.

The only port of any importance is Massowah. The capital is Asmara (7,765 feet above sea level) where there is still a considerable Italian population. A railway leads from Massowah through Asmara almost to the Sudan frontier. There is also a system of highways, some of them built or improved during the 1935-36 campaign against Ethiopia. After 1941 the Americans and British made good use of Eritrea's communication and industrial facilities for the prosecution of the campaign in Libya. Relatively little trade originates in Eritrea since the colony produces only a few exportable items such as hides and salt. The transit trade—from the Sudan, Ethiopia and lower Arabia—is also of only minor importance.

**Events.** The fate of Eritrea was the subject of discussion and dispute among the victorious Powers throughout the year—at meetings of the Big Four Council of Ministers, of their Deputies, and of the 21-nation conference held in the Luxembourg Palace at Paris. The issue was not resolved but postponed for settlement sometime in 1947. (For further details see LIBYA.) The Ethiopian Government put in a strong claim to Eritrea on historical, ethnic, cultural, and economic grounds, and the British Foreign Office indicated sympathy for this point of view. (See ETHIOPIA.)

The colony continued to be governed by the British Military Administration, which, however, kept a number of Italian—i.e., Fascist—functionaries in office. Though the British maintained that this was necessary since they did not have enough officials of their own, it inevitably led to complaints from the Eritreans and from their Ethiopian kinsmen across the border. Relations between the natives and the Sudanese soldiers of the occupying forces were far from cordial and seem to have been a contributory cause for an armed clash on August 28 in Asmara that resulted in the killing of over two-score Eritreans by the Sudanese. This massacre aroused high emotions in Addis Ababa and led to further demonstrations in Eritrea on behalf of union with Ethiopia. Another cause for serious complaint was the decision, announced by the British authorities early in the year, to let some 300 Italian businessmen and managers return to Eritrea to look after their affairs.

ROBERT GALE WOOLBERT.

**ETHIOPIA.** An empire in northeast Africa, comprising the Abyssinian highlands and adjacent lowland areas to the east, south and west. Its area is around 350,000 square miles—some of the country's boundaries have not yet been delimited exactly. Addis Ababa (population 200,000) is the capital. Other important cities are Harar, Dire Dawa, Gondar and Dessaye.

**Characteristics of the Population.** Estimates of Ethiopia's population vary widely, for there has never been a proper census. The actual figure is probably somewhere around eight or ten million.

The Amharas, who have long constituted the ruling element in the empire, probably number less than 3,000,000. They speak various derivatives of the ancient Ge'ez, a Semitic language introduced from Southern Arabia. Amharic, the most widely used of these modern tongues, is the official language of the Imperial Government. However, various other languages are spoken by the majority of the people: Galla, Somali, Danakil, Arabic, etc.

The Amharas are Coptic Christians, as are some of the Gallas. The Somali, Danakil, many of the

Gallas, and some of the peoples of southwest Ethiopia profess Islam. A number of pagan tribes are also found in the latter region. The city of Harar is the center of Moslem culture for the entire Horn of Africa.

The Coptic Church is politically powerful and owns considerable tracts of land. The clergy is numerous, and in the aggregate represents a force opposing progress. Hitherto the Abuna, or head of the Ethiopian Church, has always been an Egyptian appointed and consecrated by the Coptic Patriarch of Alexandria. However, the Ethiopian Government announced in May, 1944 (see YEAR BOOK for 1944) that when the incumbent Abuna Qirillos had ceased to reign, his successor would be appointed by the Emperor. Later, the Government decided not to wait for the death of Qirillos (see *Domestic Affairs*). The link between the Egyptian and Ethiopian branches of the Church was severed entirely during the Italian occupation. Non-Christian religions are not only tolerated, but the Government supports several Mohammedan schools.

Elementary education is provided, primarily for boys, by government and mission schools in the principal cities. So great had been the disruption wrought by the Italian occupation that Ethiopia's educational facilities have had to be rebuilt virtually from the ground up. Many of the educated young men—perhaps as many as 80 percent of them—were killed by the Fascists as a matter of policy. In addition to numerous old-style Church schools, there were, by September 1945, 171 modern government schools: 28 in Addis Ababa and 143 in the provinces. Those in the capital included arts and crafts, teacher training, technical and commercial schools. The students attending government schools numbered 31,542. Higher education is just getting under way, but considerable progress is anticipated since this matter is very close to the heart of the Emperor. The education budget rose from £96,000 for 1943-4 to £696,340 for 1945-6.

**Government.** Ethiopia merits the title of empire because it consists of several ancient kingdoms (such as Tigré, Amhara, Shoa and Gojjam) and comprises peoples who are alien in race and culture to the politically dominant Abyssinians of the plateau. The creation of this empire was the work of several generations, reaching its apogee under Emperor Menelik II (1889-1913).

The political and social structure of Ethiopia is still largely feudal, though the present ruler—Emperor Haile Selassie I—has been making some headway against the entrenched conservatism of the aristocracy and the clergy. At least a nominal modification was introduced into the system of absolute monarchy when in July, 1931, Haile Selassie decreed the creation of a Parliament. This body, first convened in November, 1932, consisted of two houses—a Senate and a Chamber of Deputies—all of whose members were nominated and whose functions were merely advisory. The Senate consisted of 27 members chosen from the hereditary chiefs of the provinces, while the Deputies were selected by the Emperor from among civil and military officials. There was also an Imperial Council, with the Emperor acting as his own Prime Minister.

Ethiopia was overrun by Italian troops in 1936 and annexed to Italy. Eritrea and Somalia were joined to it in order to form Italian East Africa, administered by a Viceroy representing the King-Emperor in Rome. This came to an end when Allied forces reconquered the country and restored

Haile Selassie to his throne (May 5, 1941). The boundaries as of 1935 were supposedly also restored, though the territorial provisions of the eventual treaty of peace with Italy may alter them somewhat. After a brief period of British military administration, Ethiopia recovered her complete sovereignty *de jure* and became one of the United Nations. Still under British military administration is the Ogaden and certain "reserved areas" around Harar. Since his return from exile, Haile Selassie has resumed the process of strengthening the central administration and reforming that in the provinces. He has also called in numerous experts from Britain, the United States, Soviet Russia and other countries to give advice in various technical fields. He has further sought to create a corps of trained Ethiopians, especially from among the younger men, who will be loyal to him rather than to the feudal chiefs, and on whom he can rely to modernize his state.

During the fiscal year 1943-44 (ending September 10) the Ethiopian budget was balanced at 38,956,058.74 Maria Theresa thalers. Revenues were set at 31,702,599.91 (including a 5,000,000 subsidy from the British Government) and expenditures at 33,472,740.67. The 1944-45 budget contained comparable figures. Some \$40,000,000 in new currency has been put into circulation.

A new Ethiopian army is being created to provide a modern defense force that can operate more quickly and effectively than the old provincial feudal levies. It has been trained by British officers, as has the newly formed police force. Equipment consists of old Italian arms, British materiel and Lend-Lease items from the United States. The new army, including regulars and territorials, is said to comprise some thirty battalions.

**Domestic Affairs.** The government of Haile Selassie continued to make progress toward consolidating the administration of the country and effecting a number of needed reforms. His determination to secure autonomy for the Ethiopian Church led him to send a mission to Egypt in order to negotiate the matter with the Coptic Holy Synod. Early in February it was learned that this body had agreed to let the Ethiopians choose their own archbishop and four bishops, provided these were later consecrated by the Patriarch in Cairo. The Synod wished to delay the naming of a new archbishop as long as the incumbent held office, but the Ethiopians wanted him replaced at once. This and other points of dispute kept the two parties from coming to an immediate agreement, despite the urgings of the Egyptian government, which took an active interest in reaching a settlement.

The Emperor's program of expanding educational facilities resulted in the opening of a number of new schools—primary, secondary, and professional—in the capital and in the provinces. The educational budget for this fiscal year beginning in September carried provision for more than double the existing number of schools and pupils. Plans included the inauguration of a university college, an agricultural college, 137 preparatory schools and 13 elementary schools. Likewise in the realm of health and sanitation notable progress was recorded. During the summer a group of Soviet doctors, medical assistants and nurses—the second Russian mission to be sent out—arrived in Addis Ababa, where it was to establish a hospital and clinic as well as a medical school from which students would go to Russia for further training.

**Economic Development.** During the year regular air services were started by Ethiopian Air Lines between Addis Ababa and Cairo via Asmara (twice

weekly), and from Addis Ababa to Jibuti and Aden (weekly). Though this corporation was an agent of the Ethiopian government, its technical operations were in the hands of T.W.A., an American firm operating services from the United States to Cairo. According to the Ethiopian company's charter, it was also to run lines from Addis Ababa and Asmara to Khartoum as well as local flights within the country.

Ethiopia's principal avenue for foreign trade, the Addis Ababa-Jibuti railroad, had fallen into considerable disrepair, with much of its locomotives and rolling stock hoarded by the French along their small stretch of the line in French Somaliland. During British military rule ordinary commercial traffic had had to wait while military traffic was taken care of. The situation began to improve in 1946, when the British Military Administration (in September) handed over operation of the line in Ethiopia to the Franco-Ethiopian Railway Company. The Ethiopian authorities had already entered agreements with the latter, stipulating that the company was to operate and develop the entire line, and that an arbitral tribunal be set up to settle disputes that should arise concerning the terms of the concession.

The unsatisfactory state of the railroad was a principal reason why UNRRA was unable to take full advantage of Ethiopia's offer, made in April, to furnish 100,000 tons of grain and other food-stuffs, as well as 10,000 tons of coffee, during the following year and a half. These quantities were available for export, but the means to get them to tidewater were lacking.

Under-Secretary of War Kenneth Royall revealed in Cairo on March 25 that a credit of \$1,000,000 had been extended to Ethiopia to enable her to purchase surplus American military supplies in the Middle East. In mid-July the Governor of the Bank of Ethiopia, George Blowers, obtained a \$3,000,000 loan from the Export-Import Bank, to be used in purchasing American capital goods, such as trucks, road-building equipment, and milling and mining apparatus. He foresaw a rise in the value of trade between the two countries from one to three million dollars. Most of Ethiopia's foreign commerce would, of course, remain with the Middle Eastern countries. He reported that Ethiopia's finances and currency system were in a sound state.

Operations got under way during the year for the exploitation of the Sinclair oil concession described in the YEAR BOOK for 1945 (p. 189).

**Peace Treaty with Italy.** The terms of the treaty of peace with Italy were under discussion throughout the year by the Council of Ministers (the Big Four), by their Deputies, and by the 21 Powers who had declared war on her, including Ethiopia. The latter's demands on Italy might be grouped under three heads: (1) territorial—i.e., Eritrea and Somalia; (2) financial—reparations; and (3) judicial—the trial of alleged war criminals such as Marshals Graziani and Badoglio. The Ethiopian government presented its case concerning these three categories of claims, by means of reasoned and documented memoranda, to the Council of Ministers and their Deputies, and through its own representatives at the 21-Power Conference held at the Luxembourg Palace in Paris during the late summer and early fall.

The course of the general discussions by the Big Four Ministers and the Luxembourg Conference has been briefly described in the article on LIBYA, and will not be repeated here. The basis of Haile Selassie's territorial claims to Eritrea and Somalia was the historic, ethnic, cultural, and geographic unity

of those areas with Ethiopia. Speaking on May 5, the tenth anniversary of the fall of Addis Ababa and the fifth of his return to the throne, Haile Selassie pleaded for a peace with justice, to small nations as well as great. On May 10 Foreign Secretary Bevin told the Council of Ministers in Paris that Britain was not disposed to reach any decision on the fate of Eritrea until Ethiopia had been consulted. Earlier, on April 29, he had suggested letting Ethiopia have the port of Assab in Eritrea. On May 17 the newly arrived Ethiopian Minister in Washington, Ras Imru, cousin of the Emperor, reiterated his government's opposition to any trusteeship arrangement over Eritrea since this would prevent its return to Ethiopia. He emphasized the importance for his country of obtaining an outlet through the Eritrean port of Massowah.

The Big Four decided, late in June and early in July, that Italy must renounce sovereignty over her African colonies but that their ultimate disposition should be fixed only after a year's interval. The necessity for waiting a year to obtain what they regarded as simple justice was not pleasing to the Ethiopians. At the Luxembourg Conference Ethiopia's case was outlined in plenary session on August 2 by the head of her delegation, Aklilu Abte Wolde, who reminded his listeners of the tremendous damage done to his country and people by the Fascist regime. The reparations bill handed in by his government amounted to some three billion dollars. The Conference's Commission on Italian Economic Problems voted on October 5 that Ethiopia should receive \$25,000,000 in reparations. Already, on September 25, the British representative on the Political and Territorial Commission for Italy had remarked that his government was favorably impressed with Ethiopia's claim to Eritrea. But there the question rested, presumably to be taken up again in 1947.

**The Economy of the Country.** Ethiopia is far from being a rich country. Few minerals have been found under her soil outside of small amounts of gold and platinum. From time to time explorers and promoters have reported the discovery of deposits of coal, iron and oil (see YEAR BOOK for 1945, p. 189). There is considerable potential water power in the rivers, notably the Blue Nile, but this can be harnessed only by sinking large amounts of capital—and the Ethiopian Government has been loath to open the country to foreign speculators. Several years ago the J. G. White Company of New York surveyed the power resources of the Blue Nile, but the Italian invasion cut short any development at that time. Parts of the ancient forests, for which the Abyssinian plateau was noted, may still be found in some of the more inaccessible regions.

Stock-raising and agriculture form the main occupations of the people. Both are conducted on rather primitive levels except where European influences have made themselves felt. The nature of the products naturally varies according to climate, altitude and other environmental factors. Cattle and sheep are found in the highlands, camels and donkeys in the lowlands. Cereals are raised widely. Very little agricultural produce is exported, each region being largely self-sufficient. The Ethiopian Ministry of Agriculture provided the following estimates in 1945: wheat, 1,700,000 hectares and 420,000 tons of grain; barley, 1,300,000 hectares and 800,000 tons; maize, 1,500,000 hectares and 1,800,000 tons; giant millet, 3,000,000 hectares and 4,500,000 tons; cattle, 12,000,000; sheep and goats, 2,000,000; horses and mules, 2,000,000; camels, 500,000. The principal exports are coffee, hides

and skins. Imports consist largely of cloth and other manufactured articles. For 1944-45 the exports were valued at £3,134,076 and the imports at £3,763,039.

Ethiopia, being without a coastline, must find outlets for her meager trade through other countries. The only railway goes from Addis Ababa to Jibuti in French Somaliland, a distance of 486 miles. It is owned and operated by a French company. One of the few benefits conferred by Italian rule was the construction of new roads. In 1935 the highways totalled 2,730 miles. The Italians improved these and added 4,340 more, of which 1,732 were macadamized and 1,401 asphalted. They also built a number of airports, thereby opening up remote and inaccessible parts of the country. One of the problems facing the Ethiopian Government at present is how to keep these roads and airports in repair.

ROBERT GALE WOOLBERT.

**ETHIOPIAN ARTS AND CRAFTS.** With the coming of the end of the global war, price controls in Ethiopia were relaxed and the local artisans again set themselves to the production of their fine handicrafts.

During 1946 there was a great increase in the production of articles from the famous native Ethiopian straw. Hand-woven baskets, mats, blankets, jewelry boxes, doilies and center pieces, and, of course straw hats, appeared again in a variety of colors.

A larger number of hides were kept in the country than formerly and one was able to find in the local stores such hand-made leather goods as women's and men's boots and shoes, saddles, women's hand-bags of rare fineness and beauty, pistol cases, sole leather and uppers of every conceivable color, and many other trinkets and curios in leather.

There was an increasing demand for articles made of bone, and during the year there appeared such items as pipe and cigarette holders, combs, inkstands, shoe horns, tumblers, etc.

Comparatively speaking, the imports on cloth were down, owing to the many new designs and colors, in fabrics made in Ethiopia, for the first time. Cotton towelling, blankets, checkered spun and striped cloth, and woolen comforters in many different colors were among the year's products made in the country.

The glass works opened again during 1946, and hit a high stride in the amount of finished work turned out. Formerly all glassware was imported. Now one may purchase locally made tea-cups, jugs, tea-pots, saucers, plates, bowls, butter and cake dishes, vases, glasses, chemical tubes, fruit bowls, and numerous glass ornaments in colors.

The Ethiopians are age-old masters in the art of jewelry making. Native artisans have always made a large number of silver and gold crosses, rings, necklaces, and other emblems and trinkets. The western influence has crept in, and one may find such hand-made articles as calipers, squares, and slide rules.

These are but a few of the many arts and crafts for which the Ethiopians are famous. A program has now been instituted in the school system so that young apprentices may learn these age-old arts from masters in the trades.

PETROS SAHLOU.

**EUROPE.** A continent with an area of about 2,079,000 square miles (excluding European U.S.S.R.) and a population estimated at 402,550,000 (ex-

cluding the population of European U.S.S.R.) on January 1, 1940. See the article on each European country.

**EVANGELICAL AND REFORMED CHURCH, The.** A denomination formed by the merger in Cleveland, Ohio, on June 26, 1934, of the Evangelical Synod of North America and the Reformed Church in the United States. The highest judicatory is the General Synod, which meets triennially. A new Constitution was declared in effect at the meeting of the General Synod, held at Lancaster, Pennsylvania, in 1940. In 1942 a new Book of Worship and Hymnal were formally adopted by the General Synod while in session at Cincinnati, Ohio. President: Rev. Dr. L. W. Goebel, 77 W. Washington St., Chicago 2, Illinois. First Vice President: Rev. Dr. John Lentz. Second Vice President: Mr. Edward Dirks. Secretary: Rev. Dr. William E. Lampe, 1505 Race St., Philadelphia 2, Pennsylvania. Treasurer: Mr. F. A. Keck, 1720 Chouteau Ave., St. Louis 3, Missouri.

In its combined statistics for the year 1945, the Evangelical and Reformed Church reports a membership of 695,971 in 2,806 congregations. Total expenditures for congregational purposes amounted to \$10,951,606, and total benevolences to \$3,175,680. The Sunday School enrollment is 42,296.

**EXECUTIVE OFFICE OF THE PRESIDENT.** An office of the executive branch of the United States Government which included in 1945 the following divisions: The White House Office; Bureau of the Budget; Liaison Office for Personnel Management; and the Office for Emergency Management.

**EXPERIMENT STATIONS, Office of.** An Office of the United States Department of Agriculture, whose functions date back to 1888. It administers Federal funds provided under various acts for the support of research in agriculture, the rural home, and rural life by experiment stations in the several States, Alaska, Hawaii, and Puerto Rico. Chief: R. W. Trullinger.

**EXPORT-IMPORT BANK OF WASHINGTON (EIB).** Created in 1934, the bank was made a permanent independent agency of the U.S. Government by the Export-Import Bank Act of 1945, approved July 31, 1945. The purpose of the Bank is to aid in the financing of exports and imports between the United States and foreign countries.

The Act of 1945 vested the management of the Bank in a board of directors consisting of the Secretary of State and four full-time directors, appointed by the President, by and with the advice and consent of the Senate. It also authorized an increase in the limit on outstanding loans and guaranties from \$700,000,000 to \$3,500,000,000 and removed the prohibition on loans by the Bank to governments in default on their obligations to the U.S. Government.

This increase in the lending authority of the Bank has permitted it to extend long-term reconstruction credits to liberated and war-devastated countries to assist them in purchasing from the United States the equipment, materials, and services required for the restoration of their economies. Largely because of credits of this type, the cumulative total of authorized loans of the Bank from the date of its establishment increased from approximately \$1,200,000,000 at the end of 1944 to more than \$3,500,000,000 at the end of 1946. Disbursements during 1946 were approximately \$1,037,000,000, and repayments were approximately \$40,000,000. As a consequence, the outstanding

loans of the Bank increased from \$245,000,000 at the end of 1945 to \$1,242,000,000 at the end of 1946.

In addition to its reconstruction loans, the Bank continues to finance the foreign trade of the United States in two other principal ways. It finances specific export and import transactions on application of United States exporters and importers, where the nature of the risk involved is such that private credit cannot be obtained. It also makes long-term loans to assist in financing the export of United States materials and equipment required for development projects in foreign countries.

#### AUGUST MAFFRY.

**EXTENSION SERVICE.** An agency of the War Food Administration, United States Department of Agriculture, established under the Agricultural Appropriation Act of 1924. Its functions are educational. An administrative and subject matter staff headed by a State director of extension work is located at each land-grant college, and county extension agents are located in nearly all the agricultural counties. These county extension agents make available to farmers, farm homemakers, and rural youth the results of research conducted by the Department of Agriculture, the land-grant institutions, and other research agencies, adapted to local farm and home conditions.

On June 29, 1945, when the War Food Administration was discontinued, the Extension Service reverted to its previous role of staff agency, continuing in its responsibility for all general educational programs of the Department.

Director of Extension Work: M. L. Wilson.

**FAEROES.** A group of 21 islands (the chief being Bordo, Kalso, Osterö, Sandö, Strömo, Sudero, Vaagö, and Viderö) north of Scotland, forming a county of Denmark. The islands were under British military control from April 10, 1940, until August, 1945. Total area, 540 square miles. Population (1935 census), 25,744. Capital, Thorshavn (on Strömo), 3,611 inhabitants. The chief exports are fish, whale oil, woolen goods, lambskins, and feathers. The islands are administered by a Danish governor and the local parliament (Lagting). The election held in the Faeroes, according to a report of Nov. 7, 1945, resulted in a victory for the pro-government coalition, which desired union with Denmark. On September 14, 1946, another election decided that the islands would sever their ties to Denmark and on September 18, Thorstein Peterson, chairman of the Faeroe Lagting, declared the islands independent. Sudero, third largest island of the group, declared it would continue to maintain its union with Denmark.

**FAIR EMPLOYMENT PRACTICE.** Committee on. Originally a Committee established by executive order within the Office of Production Management (see YEAR BOOK for 1941) on June 25, 1941, and transferred to the War Manpower Commission on July 30, 1942. This Committee ceased to exist upon the establishment of a new Committee on Fair Employment Practice within the Office for Emergency Management on May 27, 1943. On May 18, 1946, the Committee was placed in liquidation by a Presidential letter.

The purpose of the Committee was to promote the fullest utilization of all available manpower and to eliminate discriminatory employment practices. Executive Order 9346, by which it was established, provided that all agencies of the U.S. Gov-

ernment include in all contracts a provision obligating the contractor not to discriminate against any employee or applicant because of race, creed, color, or national origin. Federal agencies concerned with training for war production were required to assure that such programs are administered without discrimination. The Committee was empowered to receive and investigate complaints of discrimination, to conduct hearings, make finding of fact, and take appropriate steps to obtain elimination of such discrimination.

**FALK FOUNDATION.** The Maurice and Laura. A Foundation which concentrates its funds in support of economic research through grants to research organizations for investigations of specific problems affecting the development of American industry, trade, and finance. During 1946 payments approximating \$264,658 were made. New grants of \$349,283.00 were voted in 1946. Research investigations completed during 1946 resulted in the publication by the Brookings Institution of Washington, D.C. of *Relief and Social Security, Depreciation Policy and Postwar Expansion, and Regulation of the Security Markets*; by the National Bureau of Economic Research, Inc., New York, New York of *Domestic Servants in the United States*. The Foundation was established by Mr. Maurice Falk in 1929 with the provision that principal as well as income must be used within 35 years for such efforts to advance the general welfare as the Foundation's Board of Managers might select. Executive Director: J. Steele Gow. Chairman of the Board of Managers: Leon Falk, Jr. Offices: 1911 Farmers Bank Building, Pittsburgh 22, Pennsylvania.

**FALKLAND ISLANDS.** A British crown colony in the South Atlantic, 300 miles east of the Magellan Strait. The colony consists of two large islands, East Falkland and West Falkland, and a number of small adjacent islands. Total area: 4,618 square miles. Population (1943 estimate): 2,444. Capital: Stanley (1,246) on East Falkland. The colony is administered by a Governor, assisted by an executive council and a legislative council. Education, which is compulsory, is carried on by government and Falkland Islands Company schools and by means of travelling teachers associated with the two systems.

The chief occupation of the people is sheep farming, and wool is an important export. It was exceeded in value in 1941, however, by whale produce, representing the activity of the small population of a number of dependent islands, including South Georgia, South Shetlands, South Orkneys, South Sandwich Islands and Graham Land.

**FARM CREDIT ADMINISTRATION (FCA).** An agency of the U.S. Department of Agriculture (q.v.), established under authority of the Farm Loan Act of 1916 and subsequent acts, to provide a complete and coordinated credit system for agriculture. It makes long-term and short-term credit available to farmers and also provides credit facilities for farmers' cooperative marketing, purchasing, and business service organizations.

The United States is divided into 12 farm credit districts. In one city in each district are a Federal land bank, a Federal intermediate credit bank, a production credit corporation, and a bank for co-operatives. Activities of the four institutions in a district are coordinated through a farm credit board and an executive called the general agent, who acts as joint officer for the four units.

Federal land bank loans are long-term, amortized loans of \$100 to \$50,000 made to farmers who give as security first mortgages upon their farms. Corporations engaged in raising livestock are also eligible to borrow, under certain limitations. The rate of interest for most new loans is 4 per cent. Land bank commissioner loans up to \$7,500 may be made for the same purposes as land bank loans and also to refinance indebtedness. The contract rate of interest is 5 per cent. The 12 Federal intermediate credit banks make loans to, and discount paper for, production credit associations, the banks for cooperatives, State and national banks, agricultural credit corporations, livestock loan companies, and similar financing institutions. The 12 production credit associations provide credit for all types of farm and ranch operations, the loans being made and collected by local associations. The central and 12 district banks for cooperatives make loans to farmers' cooperative associations; loans are of three types—commodity at 1.5 percent interest; operating capital, 2.5 percent; facility, 3.5 percent.

Emergency crop and feed loans of from \$10 to \$400 in one year are made to applicants who are unable to procure adequate loans from other sources. Regional Agricultural Credit Corporations were organized to provide emergency short-term credit in 1932-33; during 1943 RACC loans were made to finance the production of essential wartime food and fiber, and in 1944 and 1945 loans were authorized in certain regions on all crops and in some regions on specified crops, as designated by the Secretary of Agriculture.

The FCA maintains a Cooperative Research and Service Division, and it also works with other government agencies in meeting postwar problems. Governor in 1946: I. W. Duggan.

**FARM SECURITY ADMINISTRATION (FSA).** An agency of the U.S. Department of Agriculture, established as the Resettlement Administration in 1935. It has made loans to nearly one million farm families for the purchase of machinery, equipment, livestock, seed, fertilizer, and other supplies. Since the war loans (up to five years at 5 per cent) have been made primarily to increase the production of essential food and fiber. The loans are accompanied by technical guidance from county supervisors. The FSA also aids in the group purchase of machinery and purebred sires and in the setting up of county-wide group health services. Under the Farm Tenant Act of 1937, loans are made for the purchase of family-type farms, \$248,750,000 having been authorized for this purpose up to June 30, 1945. The migratory labor camps originally established by FSA have been turned over to the War Food Administration for the use of seasonal workers, and the resettlement projects are being liquidated by sale of the units to residents.

On instructions from Congress, the agency began liquidation of its 152 rural resettlement projects. By December 31, 1945, 1,014,900 acres out of the 1,865,000 acres of land involved had been sold.

The functions of this administration were merged into the Farmers Home Administration on Nov. 1, 1946.

**FEDERAL BUREAU OF INVESTIGATION (FBI).** This Bureau, which serves as the investigative arm of the United States Department of Justice, was established in 1908 by Attorney General Charles J. Bonaparte. Originally known as the Bureau of Investigation, on July 1, 1935, by Congressional enactment, the name Federal Bureau of Investigation was adopted. The present Director of the FBI was

appointed in December, 1924, by the late Harlan Fiske Stone, then Attorney General, and has been reappointed by each succeeding Department of Justice head.

The jurisdiction of the Federal Bureau of Investigation extends generally to all federal crimes not specifically assigned to another agency of the Federal Government. Specifically, it is charged with the duty of investigating violations of the laws of the United States, collecting evidence in cases in which the United States is or may be a party in interest, and performing other duties imposed upon it by law.

The headquarters of the FBI is located in the Department of Justice Building in Washington, D.C. Field offices are located in strategic cities throughout the United States and its Territorial Possessions. In addition to the administrative offices it maintains in Washington its Identification Division, the FBI Laboratory, the FBI National Academy and the Uniform Crime Reporting facilities.

The Identification Division serves as a repository for identification data and today maintains the largest collection of fingerprint records in the world. Established in 1924 with a nucleus of 810,188 sets of fingerprints, the Division as of November, 1946, contained more than 103,000,000 sets. The number of fingerprints received in the Division increased from 87,918 in the fiscal year 1924 to 26,776,184 in the peak year of 1943. A total of 5,216,633 sets of fingerprints were received from 12,455 contributors during the 1946 fiscal year. Seventy-six foreign countries, Territories and Possessions of the United States cooperated in the International Exchange of fingerprint data during the 1946 fiscal year. At the end of that year the Division had notations in its files indicating that 90,175 fugitives were "wanted" by law enforcement agencies.

The FBI Laboratory, established on November 24, 1932, with one technician and a single microscope, now utilizes precision equipment valued at more than one million dollars and employs technicians schooled in 88 branches of science or its subdivisions. The FBI Laboratory serves as a scientific aid in crime detection, its facilities being available without charge to duly constituted law enforcement agencies which may submit evidence to it for scientific examination and analysis. Research is conducted to further aid law enforcement. With the cessation of hostilities, much of the Laboratory's work in the mass testing and confidential analysis category ended. Techniques developed and perfected in connection with wartime work are presently being adapted to the examination of an increased number of submissions of evidence in criminal cases. During the 1946 fiscal year 67,229 examinations were conducted involving 104,780 specimens of evidence.

The FBI National Academy, founded in July, 1935, is concerned primarily with the training of police instructors and administrators. Applicants for attendance are carefully selected from local, county and state law enforcement agencies. The course of instruction consists of various phases of law enforcement with special emphasis placed on methods of teaching, and organization of police schools within their own departments. Among the graduates of the Academy are representatives from every state in the Union, from some of the United States Territorial Possessions, and from several foreign countries. To date, 1,470 selected officers have graduated from this school. The FBI National Academy is approved as an educational institution where veterans can study under the G.I. Bill of Rights.

In its Uniform Crime Reporting project the FBI, at the request of the International Association of Chiefs of Police and pursuant to an Act of Congress, acts as a central clearinghouse for police statistics on a nationwide basis. Monthly and annual crime reports forwarded to the FBI reflecting information as to the number of persons arrested, the number found guilty, and related crime data, are summarized and published in the *Uniform Crime Reports* bulletin. The bulletin, which is published semi-annually, also contains information concerning the age, sex, race and previous criminal history of persons arrested throughout the United States as reflected by the fingerprint cards received in the Identification Division.

**Wartime Duties.** In September, 1939, the President designated the FBI as the clearing house for all matters concerning national security. This Presidential Directive placed the responsibility for handling matters pertaining to espionage, counterespionage, sabotage, subversive activities, and violations of the neutrality laws under the jurisdiction of the FBI. In December, 1941, and July, 1942, by Presidential Proclamation the Bureau was made responsible for the apprehension of alien enemies in continental United States, Puerto Rico and the Virgin Islands.

**Internal Security Matters.** Although the war with Japan was ended within 45 days after July 1, 1945, the beginning of the 1946 fiscal year, a total of 410 foreign nationals were deported during the 1946 fiscal year on the basis of FBI investigations. Closely connected with this program is the denaturalization of naturalized citizens of enemy countries who often used their citizenship as a cloak for subversive activities. Between July 20, 1942, and June 30, 1946, 191 persons were denaturalized in cases investigated by the FBI. Action against six of these took place in the 1946 fiscal year. With the termination of the war, all investigations under the sedition statutes were ordered discontinued except in cases where prosecution had begun. From Pearl Harbor to June 30, 1946, there were 41 convictions in sedition cases with total sentences of 197 years and 1 day and \$23,250 in fines. There were no convictions during the 1946 fiscal year for sedition but in the espionage category there were three convictions of Axis agents. Sentences in these cases totaled 21 years and 11 months. Savings and recoveries were \$3,650,157. Under Public Law 47, providing for punishment for anyone aiding and assisting escaped prisoners of war, there were 18 convictions with sentences totaling more than 41 years. A total of 825 prisoners of war were apprehended during the year.

During the 1946 fiscal year prosecutions under the Selective Training and Service Act resulted in 1,809 convictions with sentences totaling 3,726 years, 9 months and 15 days. Fines, savings and recoveries amounted to \$75,110. Between October 16, 1940, the date of the first registration, and June 30, 1946, the FBI closed 563,703 cases under the Act.

Reports of suspected acts of sabotage declined markedly after the end of the war. During the 1946 fiscal year, however, the FBI received 258 such reports which, after investigation and prosecution, resulted in 12 convictions with sentences of 53 years, 5 months and 12 days. Investigation determined that those responsible for damaging war materials, equipment and machinery were motivated by a desire for revenge, or became angry or jealous. It was this rather than a deliberate and planned activity to obstruct the war effort which gave rise to the sabotage. To date, the FBI has uncovered no

evidence that any act of sabotage was foreign directed.

**General Criminal Investigations.** Criminal activities throughout the nation continued during the war years and increased alarmingly after the cessation of hostilities in World War II.

All 13 kidnappings over which the FBI had jurisdiction during the fiscal year ending June 30, 1946, were solved. There were no demands for ransom. Sentences of 207 years, and one life term, resulted from the 19 convictions in this category during the year. The Federal Kidnaping Statute was passed on June 22, 1932. Since that date and through June 30, 1946, there have been 292 kidnappings investigated by the FBI. Of this number 290 have been solved and the remaining two are still under active investigation.

Forty-five life terms, 14 death sentences and terms totaling 6,701 years, 9 months and 9 days have resulted from the 603 kidnaping convictions in State and Federal courts since the passage of the Act. Eight kidnapers were killed while resisting arrest, 7 were murdered by their cohorts, 9 committed suicide, 2 were lynched and one was found to be insane.

Extortion, closely related to kidnaping in that it is a crime against the person, showed a definite increase during the past fiscal year. This violation involves the mailing of threatening letters coupled with a demand for money. Eighty convictions resulted from prosecutions with sentences totaling 261 years and 27 days. Fines in the amount of \$12,250 were levied and 16 fugitives were located. Eleven hundred eleven convictions have resulted from cases investigated by the FBI in this category since the passage of the Federal Extortion Statute in 1932. Total sentences of 4,501 years, 9 months and 11 days have been imposed. Four of the subjects responsible for the commission of these crimes were killed while resisting arrest, 3 committed suicide and 42 were found to be insane.

In the general category of statutes relating to the theft, embezzlement or illegal possession of government property, there was a decided decline from 1,815 convictions in the 1945 fiscal year to 1,472 convictions in the 1946 fiscal year. Sentences totaling 2,170 years, 2 months and 18 days were meted out. Fines, savings and recoveries were \$664,762 and 122 fugitives were located.

The termination of the war brought with it the necessity for disposing of a vast quantity of government surplus property. This disposal gave rise to an ever-increasing number of complaints of fraud against the government. Prosecutions during the 1946 fiscal year resulted in 314 convictions with sentences of 419 years, 6 months and 14 days. The fines, savings and recoveries of \$9,411,402 exceeded by 2½ times the money involved the previous fiscal year. Bribery convictions also increased. The control of prices, necessity for securing priorities for scarce material and war surplus disposal controls contributed to the material increase from 29 to 41 convictions. Sentences totaled 93 years and 15 days. Fines of \$33,341 were assessed and a recovery of \$1,270 effected.

A sharp increase was noted during the fiscal year in the number of Election Law violations. Convictions in this category increased during the 1946 fiscal year from a previous 26 to 45 with sentences totaling 78 years, 1 month and 12 days, and fines of \$4,500. This violation extends not only to preventing a person from voting, but also to stuffing ballot boxes, counting votes not cast, and other Congressional election frauds.

**National Motor Vehicle Theft Act.** The 79th Con-

gress amended the Act in September, 1945, to include aircraft within its provisions. During the 1946 fiscal year there were 3,614 convictions for violations of this statute as compared with 2,418 in the fiscal year 1945 and 2,282 in the fiscal year 1941.

Eleven thousand four hundred fifty-eight automobiles were recovered during the year in cases investigated by the FBI, an increase of 3,566 and 6,787, respectively, over the recoveries in the 1945 and 1941 fiscal years. The convictions for the fiscal year 1946 resulted in sentences of 10,853 years, 4 months and 27 days. Fines, savings, and recoveries amounted to \$9,261,912 and 1,100 fugitives were located.

From the passage of the Act to June 30, 1946, 98,088 vehicles having a total value of \$61,249,030 were recovered in cases investigated by the FBI.

**Federal Bank Robbery Act.** During the 1946 fiscal year convictions under this Act totaled 53. FBI-investigated cases were resolved with sentences totaling 377 years, 8 months and 1 day. Fines, savings, and recoveries amounted to \$214,312, and 27 fugitives were located. During the year there were 57 bank robberies, 102 bank burglaries and 22 bank larcenies committed. Of the 53 convictions 24 were for robbery, 21 for burglary and 8 for larceny-theft.

Since the enactment of the Federal Bank Robbery Act on May 18, 1934, a total of 1,108 bank robberies have been investigated by the FBI. These have resulted in 772 convictions with sentences totaling 12,156 years and 10 months. In addition, there have been 2 death sentences and 14 life terms.

**Miscellaneous Violations.** Definite increases were recorded in convictions for violations involving Crimes on the High Seas (from 176 convictions in the 1945 fiscal year to 338 in the 1946 fiscal year,) Involuntary Servitude and Slavery, Antitrust and Antiracketeering Laws, Servicemen's Dependents Allowance Act of 1942, and National Cattle Theft Act. Among the other Federal criminal statutes over which the FBI has investigative jurisdiction are the White Slave Traffic Act, National Stolen Property Act, May Act, Federal Reserve Act, and War Labor Disputes Act.

**Over-all Statistics.** During the fiscal year 1946 there were 11,873 convictions in cases investigated by the FBI. These resulted in sentences of 26,624 years, 6 months, 13 days and, in addition, 5 life terms. Fines, savings and recoveries for the year reached a total of \$68,484,935. There were 10,990 fugitives located and 11,458 automobiles recovered in FBI cases. Convictions resulted in 97.3 percent of the cases brought to trial.

J. EDGAR HOOVER.

**FEDERAL COMMUNICATIONS COMMISSION.** Removal of wartime restrictions unleashed an unprecedented demand for new or augmented radio services. This demand has taxed the Federal Communications Commission, whose funds and personnel were keyed to prewar regulation of interstate and foreign radio and wire communication.

Program broadcasting has received the greatest share of public attention because it enters the home. The application of radio to other services, affecting business and industry; and protection of life and property on land, sea, and in the air, however, have equally important implications.

The fact that the radio spectrum has been extended from its prewar "top" of 300 megacycles to 30,000 megacycles has made room for many new services and widens the horizon for further developments.

**Broadcasting.** There are now various recognized types of program broadcast service for which more than 1,200 stations are licensed. About 1,000 others have been given initial authorization to operate, with more than 1,200 additional applications on file.

**Standard Broadcast.** This oldest of program broadcast systems, which uses AM (amplitude modulation), saw its 1,000th station licensed in late August of 1946. At the close of the year there were more than 500 construction permits and more than 600 pending applications.

The new stations, it is hoped, will relieve a situation revealed in the hearing on "clear channel" (wide coverage) stations which indicated that some 38 percent of the country, with more than ten million people, was receiving no satisfactory daytime broadcast service and 57 percent of the nation, with twenty-one million people, was getting no nighttime primary service.

In 1946, as a result of a survey of broadcast programs to the inclusion of advertising, the Commission concluded: "Primary responsibility for the American system of broadcasting rests with the license of broadcast stations, including the network organizations. It is to the stations and the networks, rather than to federal regulation, that listeners must primarily turn for improved standards of broadcast service." However, the Commission pointed out that it has a statutory responsibility to consider overall program service in its public interest determinations. Consequently, in issuing and renewing licenses it is giving particular consideration to four program service factors, namely: (1) sustaining programs, with particular reference to licensees retaining a proper discretion and responsibility for maintaining a well-balanced program structure; (2) local live programs; (3) discussion of public issues, and (4) elimination of advertising excesses. Such a review of overall performance of stations in the light of promises made in their original applications is being carried out in the cases of all commercial standard, FM and television broadcasters.

**Frequency Modulation (FM).** The 48 licensed FM stations in operation at the close of the war were augmented by 17 new stations, and more than 400 others, which had obtained construction permits, were due to come on the air as quickly as materials became available. More than 200 other applicants were being considered.

When FM broadcast made its debut on a commercial basis in 1941, it continued to use the 42 to 50 megacycle band. But interference developed and, as a result of hearings, it was assigned a higher and better position in the spectrum. "Public interest," explained the Commission, "requires that FM be established in a permanent place before a considerable investment is made by the listening public in receiving sets, and by broadcasters in transmitting equipment." Consequently, this new service was to move to 84-102 megacycles by the start of 1947.

**Television.** Construction of some fifty new commercial television stations was authorized in 1946. These, together with the 6 stations on the air at the beginning of that year and the many new applicants, should give an impetus to visual broadcast in the new year.

Since television developed on six-megacycle-wide channels, it continues to occupy its present spectrum space, where 13 channels between 44 and 216 megacycles are allocated for commercial television plus space in the 480-920 megacycle band for experimentation in connection with the

development of color pictures. About 60 television stations are in experimental operation.

Television reception now extends far from sight of the antenna originating the transmissions. This is due to extension of coaxial cable. Completion of the New York-Washington section of that system permitted network handling of special programs in 1946. New radio-relay devices are also likely to carry programs far from their place of origin. There is possibility too, that television, as well as facsimile, may ultimately be linked with telephony.

**International Broadcast.** Thirty-seven stations in this country continue to transmit programs overseas. Though licensed by the Commission, they are supervised by the Department of State, which assumed that function during the war.

**Noncommercial Educational Broadcasts.** Twenty FM channels are reserved for this type of service by educational institutions. In addition to 6 licensed stations, construction of 20 more was authorized, and that many more applications were pending.

**Developmental Broadcast.** As its name implies, this class of station operates in the interest of developing new, and improving old, services and techniques. Forty such stations are either on the air or under construction.

**Relay Broadcast.** To carry programs from pickup points to studios, nearly 600 relay stations are operating in the high and low frequencies.

**Facsimile.** Facsimile is still in the experimental stage, but three stations are active in the development of a new and economic means of speeding writing and printed matter, as well as pictures, through space.

**Amateurs.** Relinquishment of frequencies by the military have permitted amateurs to regain practically all their prewar band, with additions. The number of self-styled "hams" now approaches 90,000. In 1946 the license period for amateurs was extended to three years. Their call letters are now prefixed with K or W.

**Aircraft and Ships.** Protection of life and property in the air and on the sea is aided by 10,600 radio-equipped aircraft and air stations, and about 9,500 ship stations.

**Emergency Services.** Police, Fire, and Forestry radio stations total more than 3,700, most of them being police communications systems. There are nearly 700 other classes of emergency stations.

**New Radio Services.** Railroad safety is furthered by new train communications, with more than 100 authorizations; and 1946 saw the establishment of a service for 40 electric, gas, water and gasoline pipeline companies.

**Experimental.** Preliminary to being established on a regular basis, an experimental mobile service is determining the value of radio in dispatching and controlling the movement of buses, taxicabs, delivery and repair trucks, ambulances, etc., also river craft. At the same time, telephone companies are testing mobile equipment in many cities with a view to linking radio with telephone facilities so that passengers on trains, vehicles, planes, and boats may put in and receive paid calls. Authorizations of this nature, which total 2,000, cover many mobile units. Another proposed new service would accommodate the use of "walkie talkies" and other portable two-way radios by individuals at home, work or play.

**Telephone.** Periodic reductions in toll rates aggregate \$130,000,000 annually. Interstate toll rates are now uniform. Though more than 32 million telephones are in use, three out of every five farm homes remain without telephone service. However, radiotelephone transmission is being utilized to

reach isolated communities where it is uneconomic or impracticable to extend wire lines. In 1946 the Commission proposed that recording devices be sanctioned as regular telephone equipment under conditions assuring knowledge that such appliances were employed. Thirteen public point-to-point radiotelephone stations have resumed service to some 50 foreign places.

**Telegraph.** Faced with increasing radio, telephone, and airmail competition, the Western Union Telegraph Company was in 1946 granted a general 20 percent rate increase pending Commission study of the present and future situation of this oldest form of electrical communication. Meanwhile, the unified telegraph system is modernizing by installing FM radio-beamed channels between busy centers and converting from manual to mechanical aids at important points. About 70 foreign points are now connected with this country by radiotelegraph circuits.

**Cables.** American cable mileage (about 120,000 miles) remained practically unchanged for years. The United States controls about 32 percent of the world's cables; Great Britain about 58 percent.

**Ether Policing.** In 1945 the Foreign Broadcast Intelligence Service, which monitored foreign broadcasts during the war, was transferred to the War Department. However, the Commission's Radio Intelligence Division continues to police the ether for illegal transmissions and to see that licensed transmissions keep to their assigned frequencies.

T. J. SLOWIE.

**FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.** An organization established in 1908 by 28 Protestant denominations to act for them in matters of common interest. The Council now includes most of the major Protestant denominations of the United States and also three branches of the Eastern Orthodox family.

During the past year the Council has given special attention to problems of world order. In August an international conference of Church Leaders was held in Cambridge, England.

The General Secretary, Dr. Samuel McCrea Cavert, spent the first part of the year in Geneva, Switzerland, in connection with the future plans of the World Council. Later he returned to Europe to serve in a liaison capacity between the German Church and the American Army of Occupation.

In March a special meeting was held in Columbus, Ohio, to formulate policies and programs for the post war world. Five hundred denominational representatives attended. Five major subjects were studied: The Churches and World Order; The Church and Race Relations; Veterans and the Church; Overseas Relief and Reconstruction; The Church and Economic Tensions, and Evangelism. The Council's program in these and related fields has since been strengthened. Five hundred seventy-eight religious radio programs were given on national networks. Sixteen interracial clinics were held in as many cities, together with interdenominational conferences on Family Life, Religion and Health, Christian Social Work, and Public Worship. A new department has been created to coordinate the efforts of denominations in securing young men for the ministry and through Church World Service efforts of American Churches have been channeled in relief and reconstruction for needy persons abroad.

The *Information Service* was published weekly as an analysis of social, international and interracial problems of special interest to the churches. The *Federal Council Bulletin* (monthly) is the of-

ficial organ of the Council. Other publications are: *Interracial News Letter* (bimonthly), *Town and Country Church and Postwar World*.

Officers: President: Bishop G. Bromley Oxnam. Vice President: Dr. Benjamin E. Mays. Treasurer: Harper Sibley. General Secretary: Rev. Samuel McCrea Cavert. National offices: 297 Fourth Avenue, New York 10, New York; also Woodward Building, Washington 5, D.C.

#### FEDERAL DEPOSIT INSURANCE CORPORATION (FDIC).

An independent agency of the U.S. Government, organized under the Banking Act of 1933 to insure the deposits of all banks which are entitled to the benefits of insurance under the law. The major functions of the Corporation are to pay off the depositors of insured banks closed without adequate provision having been made to pay claims of their depositors, to act as receiver for all suspended national banks and for suspended State banks when appointed by State authorities, and to prevent the continuance or development of unsafe and unsound banking practices. The Corporation may also make loans to or purchase assets from the insured banks when such loans or purchases will facilitate a merger or consolidation and will reduce the probable loss to the Corporation.

The capital stock of the Corporation is as follows: (1) by the Treasury of the United States, \$150,000,000; (2) by the Federal Reserve Banks, \$139,299,556.99. On December 31, 1945, the surplus of the Corporation amounted to \$639,852,000 and total capital account to \$929,151,000. Of the 14,184 operating commercial banks and trust companies in the United States and possessions, deposits in 13,303 banks were insured by the Federal Deposit Insurance Corporation. Of the 542 mutual savings banks, 192 were insured by the Corporation.

Federal credit unions, cooperative associations organized in accordance with the Federal Credit Union Act, were transferred to the Federal Deposit Insurance Corporation Apr. 27, 1942. On December 31, 1945, there were 3,759 Federal credit unions in operation. Share balances in credit unions are not insured by the Corporation.

Chairman in 1946: Maple T. Harl.

**FEDERAL POWER COMMISSION (FPC).** An independent agency of the U.S. Government, first established in 1920, which has jurisdiction over water power projects on navigable streams or affecting interstate or foreign commerce, or upon public lands, and over the interstate movement of electric energy. It also regulates the transportation or sale of natural gas in interstate commerce under the Natural Gas Act. Chairman in 1946: Leland Olds.

**FEDERAL RESERVE SYSTEM.** An agency of the U.S. Government established in 1913 for more effective supervision of banking in the United States and for other purposes. The System comprises the Board of Governors; the Federal Open Market Committee; the 12 Federal Reserve Banks and their branches situated in different sections of the United States; the Federal Advisory Council; and the member banks, which include all national banks in the United States and such State banks and trust companies as have voluntarily applied to the Board of Governors for membership and have been admitted to the System. Chairman in 1946: Marriner S. Eccles.

**FEDERAL SECURITY AGENCY (FSA).** An agency of the U.S. Government which was established July 1, 1939, as a result of the reorganization Act passed

by the Congress earlier in that year, to promote "social and economic security, educational opportunity, and the health of the citizens of the nation." It brings together Government agencies having related responsibilities in these broad fields. As the Agency is presently constituted, its component units are the Public Health Service, under which is Freedmen's Hospital; the Office of Education; the Social Security Administration (which also includes the Children's Bureau); the Food and Drug Administration; the Office of Vocational Rehabilitation; the Bureau of Employees' Compensation; and Saint Elizabeths Hospital. It also represents Federal participation in the work of Howard University, the Columbia Institution for the Deaf, and the American Printing House for the Blind. (See separate articles on the first five of the component agencies.) The affairs of the Federal Security Agency are under the direction and supervision of the Federal Security Administrator. He is assisted by the Assistant Administrator, who acts as Administrator in his absence, and by a staff of administrative, special, and technical assistants who aid in the activities and correlation of the various units of the Agency.

The cessation of hostilities, with victory for the United States and our allies in World War II late in 1945, had its effects on the work of the Federal Security Agency. Immediate steps were taken to conclude the several special programs that had been assigned to the Agency ancillary to the prosecution of the War. By June 30, 1946, most of these efforts had been brought to conclusion, and liquidation was nearing completion.

The Office of Community War Services, which had through the war years carried the heavy load in looking to the war-created needs for the provision of health, medical care, welfare, recreation, education, social protection, and related services, was the strong arm of the Government in the security field. It demonstrated, in the stress of war, the validity of integrated effort for health, education, and welfare. While a complete elimination of all overlapping or gaps in these services for war cannot be claimed, certainly this Office was of material aid in keeping the home front clear of chaos.

In October 1944, the Congress had provided for the disposition of war assets by enacting the Surplus Property Act (Public Law 456, 78th Cong.). By section 13 (a) of this act Congress extended to educational, health, and welfare institutions and organizations the opportunity to acquire a just portion of this property. The Surplus Property Administration (now the War Assets Administration) requested that the Federal Security Agency assist it in seeking to implement the will of Congress that surplus war property be disposed of to nonprofit institutions and instrumentalities at a value which would take into account benefits accruing to the United States from the use of such property by such agencies. To this end the Office of War Property Distribution, established in the Office of the Federal Security Administrator, cooperated with and acted as the agent of the War Assets Administration. Through facilities of the Public Health Service, the Office of Education, and the Social Security Board, procedures and policies were fostered to aid distribution of needed property to health, educational, and welfare agencies. In addition, this Agency was concerned with donations of excess property by the Army and Navy to educational institutions under statutes other than the Surplus Property Act. By the close of the fiscal year the mission of the Federal Security Agency in this field was nearing completion.

With increasing freedom from wartime functions it was possible to turn more adequate attention to the continuing job. Although the Federal Security Agency, as such, is a stranger in a world at peace, its establishment, just two months before Germany invaded Poland, was entirely coincidental with the ominous war situation. The basic idea of a closer integration of education, health, and welfare was neither new nor of partisan origin. Federal reorganization to this end had been successively sponsored by Presidents Harding, Coolidge, Hoover, and Franklin Roosevelt. Under President Harding the Joint Committee on the Reorganization of the Administrative Branch of the Government recommended the establishment of a "Department of Education and Welfare." This recommendation received strong support before the Sixty-eighth, Sixty-ninth, and Seventieth Congresses. Thereafter, President Hoover, on December 9, 1932, proposed to the Congress the establishment, in the Department of Interior, of a "Division of Education, Health, and Recreation" with an assistant secretary in charge. Under President Roosevelt the Committee on Administrative Management, on January 8, 1937, urged the establishment of a "Department of Social Welfare." This proposal, incorporated in a reorganization bill, passed the Senate and received very substantial support in the House. Thus the idea was not a new one when President Roosevelt, on April 25, 1939, proposed the establishment of the Federal Security Agency to a Congress which proved more receptive than had its predecessors.

During the past year, President Truman with victory in war complete and the problems of peace at hand, moved to strengthen the arm of the Federal Government for the better integration of services in the fields of education, health, and welfare. In presenting his Reorganization Plan No. 2 of 1946 to the Congress on May 16, 1946, President Truman said:

"To meet its full responsibilities in these fields, the Federal Government requires efficient machinery for the administration of its social programs. Until 1939 the agencies in charge of these activities were scattered in many parts of the Government. In that year President Roosevelt took the first great step toward effective organization in this area when he submitted Reorganization Plan I establishing the Federal Security Agency—to promote social and economic security, educational opportunity, and the health of the citizens of the Nation. . . .

"The reorganization plan here presented is a second important step in building a central agency for the administration of Federal activities primarily relating to the conservation and development of human resources; but, while this step is important in itself, I believe that a third step should soon be taken. The time is at hand when that agency should be converted into an executive department."

Not only did the Congress accept the Truman proposal for a strengthened Federal Security Agency, but the suggestion of departmental status was promptly followed by the introduction of a bill to this end with bipartisan sponsorship.

Other evidences of extensive interest in the security fields were in prominence during the second session of the Seventy-ninth Congress as it turned its thoughts from the waging of war to the better things of the dawning peace. During this session, there were under consideration several hundred bills seeking to improve the security program. In subject matter these bills were about equally di-

vided between education, health, and welfare. Congressional committees held extensive hearings treating with these subjects, while President Truman in three messages focused the attention of Congress and the people on urgent, unmet needs. On September 6, 1945, less than a month after the fighting stopped, the President called for legislation on the broad front to implement and give substance to what Franklin Delano Roosevelt had called the "Economic Bill of Rights." This was followed by the historic Health Message of November 19, 1945. Again, in the "State of the Union Message" of January 21, 1946, the key importance of security needs was highlighted. Summarizing, the President said:

"Our basic objective—toward which all others lead—is to improve the welfare of the American people. In addition to economic prosperity, this means that we need social security in the fullest sense of the term; the people must be protected from the fear of want during old age, sickness, and unemployment. Opportunities for a good education and adequate medical care must be generally available."

The Congress was responsive in its concern for health, education, and welfare, and prior to *sine die* adjournment sent to the President four acts of far-reaching importance in these fields: (1) the National Mental Health Act (P.L. 487), (2) the Vocational Education Act of 1946 (P.L. 586), (3) the Social Security Act Amendments of 1946 (P.L. 719), and (4) the Hospital Survey and Construction Act (P.L. 725). While this legislative accomplishment fell somewhat short of the President's program, it was of substantial value, and above all, indicated a healthy concern as to the place of security services in our peacetime economy.

WATSON B. MILLER.

**FEDERAL TRADE COMMISSION (FTC).** An independent agency of the U.S. Government, established in 1914, which has the following threefold purpose: To promote free and fair competition in interstate trade in the interest of the public through prevention of price-fixing agreements, boycotts, combinations, and other unfair methods of competition and unfair and deceptive acts and practices; to safeguard life and health of the consuming public by preventing the dissemination of false and fraudulent advertisements of food, drugs, cosmetics, and devices which may be injurious to health; and to make available to the President, the Congress, and the public factual data concerning economic and business conditions as a basis for remedial legislation where needed, and for the guidance and protection of the public interest. Chairman in 1946: William A. Ayres.

**FEDERAL WORKS AGENCY (FWA).** An Agency of the U.S. Government comprising the five agencies which are concerned with the provision and financing of public works and services, namely, Public Works Administration, Public Buildings Administration, Public Roads Administration (q.v.), Federal Fire Council, and Federal Real Estate Board. The functions of the Public Works Administration and the Work Projects Administration are now in process of liquidation in the Office of the Federal Works Administrator. Administrator in 1946: Maj. Gen. Philip B. Fleming.

**FENCING.** José de Capriles, who served as an officer in the Army Air Forces during the war, returned to the strips last year to capture the foils championship in the fifty-fifth annual national competition

at the Fencers Club in New York. Member of a famous fencing family, the Salle Santelli swordsman, who had won many honors in the sport but never the United States foils laurels, triumphed over eight rivals.

Another star, Albert Wolfe, French-born ace from Louisville, Kentucky, returned to action and won the *épée* crown while Dr. Tibor Nyilas, Salle Santelli, wrested the saber championship from Norman Armitage, Fencers Club, who had won the honors ten times. The three-weapon team prize was annexed by the New York A.C. combination of Dernell Every, foils; Henrique Santos, *épée*, and Dr. James Flynn, saber.

Miss Helene Mayer, San Francisco blond, also came back to tourney fencing and gained the United States women's foils laurels for the eighth time. Miss Barbara Weiss of New York University took the individual prize in the eighteenth annual women's intercollegiate tournament with the team title going to Hunter College.

THOMAS V. HANEY.

**FERRO-ALLOYS.** With requirements for ferro-alloys for steel making far below wartime levels, mining of such ferro-alloying minerals as occur in the United States took a sharp drop, and imports decreased correspondingly. For such metals as chrome and manganese, for which strenuous efforts had been made to develop domestic deposits during the war, dependence reverted almost wholly to cheaper foreign sources. A stockpiling act for critical minerals, passed by Congress in July, laid heavy emphasis on domestic sources; however, it gave only limited promise of future activity. In signing the Act, President Truman commented that its "Buy American" clause would increase costs of acquiring the stockpile, deplete "our inadequate underground reserves," possibly conflict with foreign economic policy, and might hamper the primary purpose of enlarging stocks of critical raw materials. Thus it appeared that "escape provisions" in the law, by which purchases could be made abroad, might be relied on heavily.

**Chrome.** With many special inducements offered during the war withdrawn, domestic chrome mining in the United States slipped back into the dormancy which had prevailed in all previous non-war years. Under the government purchasing program during the war domestic chromite producers received prices above Office of Price Administration ceilings, delivery points close to mines, and specifications less rigid than those of the open market. When the government buying program stopped, most domestic mines became uneconomic. Of the 339,721 short tons of chromite purchased by the government during the war period, only 19 percent was absorbed by industry, because of low quality, despite drastic shortages. United States mine production of chromite in 1946 was less than 3,600 tons (1945: 13,973 tons; 1944: 45,629 tons).

Imports during 1946 approximated 754,308 tons (1945: 914,765 tons). Cuba, Russia, Southern Rhodesia, and Turkey were principal sources. Mining in the Philippine Islands, which supplied about one-quarter of total United States imports in some prewar years, was slow in getting back on its feet. Domestic consumption was approximately 700,000 tons.

Ferro-chrome, produced from chromite ore, is added to alloy steels to increase hardenability, strength at high temperatures, and resistance to abrasion, corrosion, and oxidation. Many of these steels are popularly known as "stainless."

**Manganese.** Consumption of manganese ore (35

percent Mn) dropped to 1,200,000 short tons in 1946 from the wartime level of approximately 1,500,000 short tons (1945: 1,485,859 tons). About 90 percent of it continued to find its way into iron and steel making, either as ore or as alloys (ferromanganese, spiegeleisen, silicomanganese). The properties of manganese as a deoxidizer make it important in all steel production; also it imparts the quality of hardness to alloy steels. Dry cell batteries and chemicals account for less than 5 percent of the total consumed.

With free access to foreign sources, imports were heavy in 1946, amounting to about ten times the tonnage mined in the United States. About 1,500,000 tons of ore and concentrates (35 percent or more Mn) came from abroad (1945: 1,461,945 tons) compared to 153,000 tons (1945: 182,000 tons) produced by domestic mines. India and the Gold Coast each accounted for about one-fifth of the total imports, with slightly smaller amounts from Russia and South Africa, and some tonnage from Brazil, Cuba, Chile, French West Africa, and Mexico.

In the United States, ore was shipped from mines in Arkansas, California, Montana, Nevada, New Mexico, Virginia and Washington, with Montana the principal producer. United States ore reserves are conceded to be extensive, but most of the ore either is low in manganese content or presents complex processing problems, thus raising production expense.

The government, through the Office of Metals Reserve, maintains a strategic stockpile, which totalled about 1,000,000 tons on October 31, 1946. About 700,000 tons was in consumers and producers stocks on the same date, according to the U.S. Bureau of Mines.

**Molybdenum.** One of the few strategic minerals of which the United States was able to produce more than its own requirements during the war, molybdenum was mined at a far lower rate in 1946 to meet peacetime demands. Mine production in the United States was about 16,000,000 lb. in 1946 (1945: revised: 30,801,700 lb.; 1943: 61,666,800 lb.). Molybdenum occurs as the principal mineral in ore coming from three mines in the U.S., of which the Climax Mine, high in the Rocky Mountains of Colorado, is the largest. Climax accounted for about half of the total production. The balance of molybdenum production came as a by-product of the mining of such other metals as copper and tungsten in Utah, New Mexico, Arizona, Nevada and California.

Consumption of molybdenum follows closely the production pattern of alloy steels, which represent its dominant use. As an alloying element in steel, the use of molybdenum, which reached a peak during the war as a substitute for such scarcer alloys as tungsten, has increased greatly over prewar levels, and now is added in some amount to more than three-quarters of the alloyed engineering steels. It is particularly important in the heat and corrosion resistant steels and alloys used in such products as aircraft turbo-superchargers and gas turbines. Because of its high melting point (4748° F.), molybdenum also is used in minor amounts in crucibles, electronic tube parts, electrical contacts, thermocouple tubes, and electric furnace heating elements for high temperature work in a vacuum or protective atmosphere. Total consumption in the United States was 14,000,000 lb.

Strategic stocks of molybdenum concentrates, totalling about 4,500,000 lb. in Mo content, were held by the government late in the year.

**Nickel.** Development of deposits in Cuba and

Russia recently have cut from 90 percent to about 75 percent the portion of world production coming from the Sudbury, Ontario, district of Canada, but the Sudbury mines still supply the bulk of U.S. demand (See Table). It is estimated that 1946 production from Sudbury totalled about 200,000,000 lb. (1945: 246,000,000 lb.), a high peacetime mark.

Former Finnish deposits at Petsamo now are being developed by Russia. Mines in New Caledonia, which contributed to U.S. wartime needs, in 1946 diverted their entire output to France. Cuban deposits, developed under the sponsorship of the U.S. government during the war, continued to be operated by a private firm, and shipped nickel oxide to the steel industry.

Because of the increasing demand for stainless and other heat and corrosion resistant steels in which nickel is a principal alloy it was expected that demand would continue high in future years.

U.S. NICKEL IMPORTS, 1945-46  
(In lb.)

Source	Form	1945	1946 (Jan-Sept.)
Canada . . . .	(Matte)	34,753,404	30,233,517
	(Refined Ni)	118,479,626	101,571,387
	Total	153,233,030	131,804,904
Cuba . . . .	Nickel oxide	22,234,393	22,805,756
New Caledonia	(Matte)	11,353,451	0
	(Nickel oxide)	4,853,662	875,548
	Total	16,207,113	875,548
United Kingdom .	Refined Ni	4,987,770	881,000

No nickel deposits of commercial grade are known in the United States, although the U.S. Bureau of Mines conducted exploration on low grade deposits on the Oregon coast during the year.

**Tungsten.** Consumption of tungsten in the United States dropped in 1946 to about 6,200 tons (60 percent  $WO_3$  basis), one-fourth of wartime levels, with a corresponding drop in domestic production and imports. Domestic output was principally confined to a few mines in California and Nevada, and to the Salt Lake City treatment plant, which accounted for the bulk of the year's total, 4,000 tons in terms of 60 percent  $WO_3$  concentrates (1945, revised: 5666 short tons). Two government sponsored milling and treatment plants, in Red House, Nevada, and Salt Lake City, respectively, ceased operations during the year. A portion of the huge Basic Magnesium, Inc., plant near Las Vegas, Nevada, was leased for the installation of a chemical treatment plant for tungsten ore.

About one-third of the total imports (1946: about 7,160 tons of 60 percent concentrates) came from Bolivia. Before the war, about 70 percent of world production was in Burma and China. Burma had recovered sufficiently to produce only a trickle in 1946. Some concentrates also were imported from Southern Rhodesia, Argentina, Australia, Canada, Peru, Thailand, United Kingdom, Brazil, Spain, Belgian Congo, Portugal, Union of South Africa, and China.

Use of tungsten for electric lamp filaments is perhaps most widely known, but from the standpoint of quantity, far more goes into alloy steels. It is a principal alloying element in tool and die steels and in tungsten carbide tools, making it a key element in the working and forming of metals.

The United States government maintains a large strategic stockpile of tungsten ore and concentrates through the Office of Metals Reserve, the Treasury procurement division, and the Navy. The Office of Metals Reserve stockpile comprised 5,851 short tons of primary concentrates (60 percent  $WO_3$  basis) on September 30, but stocks of the other government departments were not revealed.

**Vanadium.** Consumption of vanadium leveled off in 1946 after its sharp drop from the war peak of 7,262,634 pounds in 1943, with approximately 1,200,000 lb. going to industry. Consumption followed closely the production pattern of alloy steel output, which takes more than 95 percent of the total, with a sharp dip reflecting the steel strike early in the year. Some vanadium is used in non-ferrous alloys and as a catalyst in the manufacture of aviation gasoline.

Imports, contained in ore, concentrates, and flue dust would amount to approximately 812,000 lb., it appeared late in the year. Peru was the sole foreign supplier of ore and concentrates, with the flue dust, resulting from the burning of petroleum containing vanadium compounds, from Curaçao.

Domestic mine production, more than 90 percent of it from Colorado and the balance from Utah and Arizona, dropped to 1,000,000 lb. of contained vanadium (1945: 2,963,913 lb.; 1943: 5,586,492 lb.)

A federal grand jury in June returned indictments against subsidiaries of the Union Carbide & Carbon Corp. and Vanadium Corp. of America charging a conspiracy which had brought about a monopoly in the mining and selling of vanadium and vanadium bearing ores in the United States.

CHARLES T. POST.

**FIJI.** A British colony in the South Pacific, due east of northern Australia, consisting of some 250 islands, about 80 of which are inhabited, and the dependent island of Rotuma. Area, including Rotuma: 7,083 square miles. Viti Levu, area 4,053 square miles, is the largest of the islands. Population, including Rotuma: 198,379 (1944 estimate). Capital: Suva.

A governor, assisted by an Executive Council, administers the colony. There is a Legislative Council with the Governor as president, with five European members, three of whom are elected; five Fijian members, chosen by the Governor from a panel presented by the Council of Chiefs, and five East Indian members, three of whom are elected. Self-government is maintained through the Council of Chiefs, each of whom represents and controls a district.

Bananas, coconuts, maize, sugar cane, rice, and tobacco are the principal products. Valuable woods are obtained in some of the southern islands. There are a number of factories processing the islands' products, but it is necessary to import clothing, tools and machines. Over a period, exports and imports tend to balance, with Australia, New Zealand, and the United States as the chief countries involved.

**FILIPINO REHABILITATION COMMISSION.** A Commission created by Act of Congress, approved June 29, 1944, to investigate and formulate recommendations on all matters affecting postwar economy, trade, finance, economic stability, and rehabilitation of the Philippine Islands, including the matter of damages to public and private property and to persons occasioned by enemy attack and occupation. United States Chairman, Millard E. Tydings.

**FINANCIAL REVIEW.** A severe break in stock prices in the latter part of August and early in September ended the four-year bull market in securities that began in April, 1942. Coming at a time when business activity was at its highest mark since V-J Day with commodity prices rising and corporate profits running at the best rate in history, the drop

INDUSTRIAL AVERAGE, 1935-1946

Dow-Jones

in stock prices took the public by surprise. However, there were a number of points of similarity between the fall in stock prices in the late summer of 1946 and that which took place in the spring of 1920, before business activity and commodity prices turned down in that year.

This decline in the stock market exerted a restraining effect at a time when inflationary pressure was apparent throughout the economy. It checked a boom in new stock flotations that developed earlier in the year, many of a highly speculative character, and also curtailed buying of high-priced luxuries and costly homes.

**The Stock Market.** The sharp rise in stock prices that began before V-J Day was continued, with minor interruptions, during the first five months of 1946. The Dow-Jones industrial average reached its peak on May 29, when it closed at 212.50, the highest reached since 1930. With the settlement of major labor disputes, there was widespread confidence that American business would enjoy a protracted period of prosperity, and that corporate profits would increase despite the higher level of

wages. True, a number of industries were squeezed between rising costs and fixed selling prices, notably steel, automobile and electrical manufacturers, but it was anticipated that either wage ceilings would be lifted or price controls would be ended altogether. When the Price Control Act expired on June 30, the market rallied, but did not return to the May 29 level. Thereafter, it fluctuated irregularly until mid-August, when weakness developed and became pronounced late in the month. By early September, a wave of liquidation was under way and bids were marked down sharply between sales on many issues. Although it was believed that the non-durable goods industries would be most vulnerable, all groups participated in the decline, just as the preceding advance had been quite inclusive. While the market rallied several times during the final months of the year, liquidation made its appearance on each upturn and the industrial average fell back repeatedly to the low level of the September break. The trend was upward in December when moderate optimism revived over the outlook for the automobile and other heavy in-

dustries and a number of favorable dividend announcements appeared.

A striking feature of the sharp break in the stock market was the fact that it occurred at a time when margin trading was barred. The Board of Governors of the Federal Reserve System had lifted margin requirements under Regulation T and Regulation U to 100 percent on January 21, so that

new security purchases thereafter required full cash payment. However, customers did not have to pay off balances due brokers and banks in margin accounts or security loans previously incurred, unless they wished to withdraw securities or cash. The selling in the August-September break was thus deliberate and not forced by impairment of margin accounts, as was so common in the past. Generally speaking, owners of securities did not have to sell,

but chose to do so because of uneasiness over the longer-term business and profits outlook. There was a certain amount of borrowing from banks on security collateral, particularly in connection with arbitrage transactions, but forced liquidation from this source did not reach any considerable volume. While impairment of margin accounts in the past had given rise to forced selling that accelerated and intensified price declines, at the bottom of the 1946 recession it was argued that the 100 percent margin requirement curtailed support buying and so hampered rallying tendencies. However, the Board of Governors of the Federal Reserve System took the position that the inflation threat remained severe, and that no relaxation of margin requirements was justified at the time.

The turnover on the New York Stock Exchange aggregated 363,709,312 shares during the year, or slightly less than the 377,563,575 shares traded in 1945. The largest daily turnover was 3,624,010 shares on September 4, when the stock market break was in full swing. The year was the first since 1941 in which stock prices declined for the year as a whole.

The high, low, and closing prices of leading issues listed on the New York Stock Exchange are shown in Table 1.

**The Bond Market.** The long bull market in bonds that began in the summer of 1940 culminated during 1946. In the early months of the year, bond prices advanced with the stock market. Prices of Government obligations in particular turned very strong when institutional buyers felt that the Treasury would not put out another long-term issue following the Victory loan, so that they would have to acquire additional bonds for their needs by bidding for them in the open market. The huge Victory 2 $\frac{1}{2}$  percent issue of 1972, the largest single bond issue ever sold, soared to a premium of more than six points in April, carrying prices of gilt-edge bonds and preferred stocks up with it. A break of several points in quotations of long-term Government bonds in May marked the turning point, and prices of high-grade securities declined until the final weeks of the year, when a modest rally occurred. New corporate financing, which was at the heaviest rate in many years in April and May, receded sharply with the decline in bond prices. Yields on bonds of various ratings for November, 1946 compared as follows with those at the end of 1945:

Rating	1945	1946
Aaa . . . . .	2 61	2 59
Aa . . . . .	2 68	2 69
A . . . . .	2 79	2 84
Baa . . . . .	3 10	3 17

Yields on municipal securities increased substantially as prospects of tax reduction lowered the value of the tax exemption privilege. Furthermore, as the supply of municipal issues increased, it was necessary to find buyers among institutional and other investors who were not able to benefit as much from the income tax exemption feature as did wealthy investors in the top personal income tax brackets.

Changes in yields of United States Government, municipal and high-grade corporate obligations from month to month during 1946 are listed in Table 2.

The turnover of bonds on the New York Stock Exchange aggregated only \$1,364,000,000 for the year, the smallest since 1917. As in preceding years, a reason for the relatively reduced turnover on the New York Stock Exchange was the greatly en-

<sup>a</sup> United States Government bonds

A feature of the bond market during the year was the ending of the wartime limitation upon daily fluctuations in prices of Government securities to  $\frac{1}{4}$  of a point. This limitation on daily price changes was an informal arrangement that was adopted without publicity during the war. When selling pressure on the Government bond market increased late in April with abolition of the preferential discount rate of  $\frac{1}{2}$  of 1 percent on advances secured by short-term Government obligations, the dealers ended price limits after trading had become virtually impossible for several days because bids were not available  $\frac{1}{4}$  point below those of the previous day. Thereafter, the market for long-term Government securities was free to fluctuate, although the Federal Reserve banks continued to intervene in the market.

**New Financing.** For the first time in many years,

the Federal Government did not borrow new money in 1946. On the contrary, a substantial cut was effected in the public debt through application of the huge cash balance resulting from the Victory loan to this purpose.

Corporate financing was heavy in the early months of the year, and a large number of new speculative stock issues were successfully sold while the market was rising. Many of these issues were quoted at premiums immediately after offering, which increased the public's appetite for such flotations. With the decline in bond and stock prices in the latter half of the year, new financing activity dwindled.

New State and municipal financing increased for the year, as local public works postponed during the war were launched. Corporate financing to raise new capital was the largest in a number of years, the decline in total financing on corporate account being due to lessened refunding activity. New financing for 1946 by issuers other than the Federal Government aggregated \$8,476,000,000, as compared with \$7,958,000,000 in 1945. New financing month by month during the year is shown in Table 3.

**The Nation's Savings.** A sharp decline in the volume of national savings occurred during 1946, as consumer expenditures soared because of higher prices and larger supplies of consumer goods available. Savings for the year were estimated by the Department of Commerce at \$17,500,000,000, as compared with \$33,100,000,000 the year before. This was the smallest total since 1941, and represented only 12 percent of the national income. The trend of savings during the war period and in each quarter of 1946 is shown in Table 4.

Corporate liquid resources, which had expanded very sharply during the war, were reduced moderately in 1946 because of huge plant expenditures, heavy purchases of goods for inventory and payment of taxes due. This was particularly true of corporations whose activities expanded during the war and those that had operating losses because of strikes and reconversion delays. A number of large corporations such as the General Motors Corporation and the General Electric Corporation arranged to borrow substantial sums of money because of the heavy drain on their cash resources. The Securities and Exchange Commission reported current assets and liabilities of all United States corporations except banks and insurance companies as shown in Table 5.

**Regulatory Policy.** Changes in personnel on the Securities and Exchange Commission brought the promise of modifications in security regulations, with a view to simplifying requirements and facilitating the conduct of business. The SEC worked on simplifying its registration forms, particularly

for new offerings under the Securities Act of 1933. The Commission also gave considerable study to the dissemination of information about new offerings before the effective date of registration statements. Proposals were advanced for permitting wide circulation among prospective buyers of the preliminary or "red herring" prospectus that is prepared for a new offering before the price and date have been filed with the SEC.

The sharp break in stock prices in the spring centered attention upon the heavy liability incurred by underwriters in "stand-by" agreements, under which investment bankers agree to purchase the portion of a new security offering to a corporation's stockholders that the latter do not take. Proposals were advanced for reducing such liability through permitting underwriters to purchase rights for these offerings in the market while the offer is open, exercising them and selling the stock thus acquired through their sales forces. Circulation of the "red herring" prospectus also was expected to reduce underwriting risks in these cases by shortening the stand-by period.

JULES I. BOGEN.

**FINE ARTS, Commission of.** The official advisory body of the U.S. Government upon matters of art concerning projects of the Federal Government in the District of Columbia, composed of seven members appointed by the President. Expenditures are administered by the Department of the Interior. Chairman: Gilmore D. Clark. It is not to be confused with the Section of Fine Arts of the Public Buildings Administration, which was formerly charged with the selection and placing of designs in public buildings but was discontinued in 1943.

**FINLAND.** A republic of Northern Europe. Capital, Helsinki (Helsingfors).

**Area and Population.** Finland's original area of 149,588 sq. mi., including about 11 percent of inland water area, was reduced to 134,253 sq. mi. by the Soviet-Finnish peace treaty of Mar. 12, 1940, and was further reduced to about 127,600 sq. mi.

under the terms of the armistice of September 19, 1944, following the second war with Soviet Russia. The estimated population of the prewar area on January 1, 1943, was 3,887,217. About 89 percent of the inhabitants speak Finnish and most of the remainder Swedish. Estimated populations of the chief cities on January 1, 1940, were: Helsinki (Helsingfors), 304,965; Tampere (Tammerfors), 76,730; Turku (Åbo), 74,351; Viipuri (Viborg)—ceded to the Soviet Union—74,247; Vaasa (Vasa), 32,695. Swedish place names are given above in parentheses.

**Education and Religion.** School attendance was: elementary (1944), 377,014; secondary (1945), 78,232; university and schools for higher education (1945), 11,658. The population in January, 1943 included: 3,779,166 Lutherans; 70,542 Greek Catholics; 1,050 Roman Catholics; 10,631 Baptists, etc.; 1,467 Jews; and 519 Mohammedans.

**Government.** The Constitution of July 17, 1919, vested executive powers in a President elected for six years by 300 electors, chosen in the same manner as members of the Diet. Legislative power rests with the unicameral Diet and the President. The 200 members of the Diet are elected by direct vote of all citizens, male and female, 24 years or more of age. The standing of the parties in the Diet elected July, 1939, was: Social-Democrats, 85; Agrarians, 57; Coalition Party, 25; Swedish People's Party, 18; IKL (Fascist group), 8; Progressives, 7. For the present composition of the Diet, see *Events*, below. President of the republic is Field Marshal Baron Carl Gustav Mannerheim, who was elected to this post on August 1, 1944, upon the resignation of President Risto Ryti. Under the emergency legislation passed at that time (see *YEAR BOOK* for 1944, p. 217) some functions until then exercised by the President were transferred to the Premier. Juho K. Paasikivi, who became Premier on November 17, 1944, was elected President by the House of Representatives on March 9, 1945.

**Events, 1946.** In the early months of the year, Finland's public life was overshadowed by the great trial of former President Risto Ryti and seven other high officials, accused of responsibility for the war with Russia, and its political repercussions.

The verdict of the special "People's Court," which had been created *ad hoc* by an act of Parliament, was announced on February 21. All the defendants were found guilty. Ryti was sentenced to ten years in prison at hard labor. Former Minister of Finance Vaino Tanner and former Premier Edvin Linkomies were given five and a half years each; former Premier Jukka Rangell, six years; the former Minister to Berlin, Toivo M. Kivimäki, five years; Sir Henrik Ramsay, former Foreign Minister, two and a half years; former Minister of Education, Antti Kukkonen and former Assistant Minister of Finance Tyko Reinikka, each two years.

It had been clearly a political trial, and the comparatively mild sentences represented a compromise. Some, if not all, of the accused were unquestionably responsible for Finland's involvement in the war at Germany's side, and for her failure to make an early peace. The eight men, however, had been puppets rather than war criminals, and their guilt was small compared to that of the defendants in the Nuremberg Trial. Even so, their conviction and punishment was inescapable, and a few days before the verdict was announced the Speaker of the Finnish Diet, Karl Fagerholm, had expressed the view that Finland would face "bad times," if the verdict should displease the victors, Russia and Britain.

Thus the proceedings, while technically fair,

were carried on under political pressure, which did not, however, aim at death sentences. Nor did the Russian-dominated Control Commission subsequently interfere with the latitude shown the condemned men by the prison authorities. They were not really subjected to hard labor but were permitted to engage in writing or studies while serving their terms in large, modern cells at the Helsinki Central Prison.

**President Mannerheim Steps Down.** As a direct, though officially unavowed, consequence of this trial and the conviction of his close associates during the war, President Mannerheim resigned on March 4, two months after his return from a prolonged stay abroad. Unmolested by the authorities, the aged ex-President then retired to his estate at Geriknaes. In mid-October he went to Stockholm for treatment by an ulcer specialist.

On March 9, Acting President and Premier Juho K. Paasikivi was elected, by a 159 to 14 vote of the Diet, to succeed Mannerheim until March 1950, when the latter's term would have expired.

Paasikivi's elevation to the presidency made the choice of a new Premier necessary. Urho Kekkonen, former Minister of Justice, having failed in the task of forming a government given him by the new President, the latter turned over the job to Mauno Pekkala, a leader of the Social-Democratic party's left wing.

On March 25, Premier Pekkala formed a Cabinet composed of five members of his own party, six Popular Democrats (Communists), five members of the Agrarian League and one representative of the Swedish People's party. Another Swedo-Finn without party affiliation, Carl J. H. Enckell, was continued in his former post as Foreign Minister. The new Government was regarded as being somewhat more Leftist than the preceding one.

**The Purge Continues.** The new Government, and in particular the Communist Minister of Interior Yrjö Leino, vigorously pursued the purge of pro-German or anti-Russian elements in the Army, which had begun the year before. In the first days of June, a large number of General Staff officers were arrested on charges of having set up secret arms dumps in violation of the Armistice. On June 14, Lt. Gen. Hugo Oesterman, two other generals, and a number of other high-ranking officers were discharged from the Army by order of the President. On July 24, the State Police announced the arrest of Lt. Col. Christian Fabritius, who was officially identified as the leader of a secret pro-German movement established after the Armistice.

After an eight months' investigation, Lt. Gen. Karl L. Oesch, former Chief of the General Staff, went on trial on various war crimes charges. Late in July, he was convicted and sentenced to twelve years in prison at hard labor. A colonel and a major were also given long prison terms for the maltreatment of Russian prisoners of war.

On November 21 the new Chief of the General Staff, Gen. Ilmari Karhu, was also arrested in connection with the arms caches affair.

The purge extended also to the political field, involving in particular a number of Tanner's followers in the Social-Democratic party. This led to a serious rift within the ranks of that party, which had already been split, at the end of March, by the secession of its left wing under Pekkala. Other influential members of the party followed suit, but at the party convention in June the imprisoned Tanner still proved to be the strong man. In a heated contest for the leadership of the party, the "Tannerite" Emil Skog won by a large majority over the "anti-Tannerite" Karl Fagerholm.

**Pilgrimage to Moscow.** The principal problem confronting Premier Pekkala and his Cabinet from their first day in office was how to obtain the best possible conditions for Finland at the forthcoming peace conference. They felt, in particular, that the little country was hardly able to bear the heavy reparations burden imposed on it by the Armistice of September 1944.

On April 17, a strong Finnish delegation, headed by Premier Pekkala, arrived in Moscow for personal talks with Stalin and other Soviet Government leaders, at which they hoped to create a favorable atmosphere for the later peace conference. They stayed in the Soviet capital until April 24.

Although the Finns were treated to the Kremlin's usual display of lavish hospitality, they did not accomplish very much. Stalin, it is true, agreed to waive any further claims for restitution of property removed by the Finns from Karelia during the war—valued at three billion Finnish marks—and he also made some concessions concerning Finnish traffic problems, but the Russians were adamant on the territorial status quo, and on the \$300,000,000 reparations total fixed by the Armistice.

The delegation also put the finishing touches to a new Finnish-Russian trade agreement, under which the Soviet Union promised to supply Finland with 100,000 tons of critically needed cereals as well as an unspecified amount of fertilizers, in exchange for Finnish forest products and minerals. The treaty, which was published on May 3, provided for the exchange of \$32,000,000 worth of merchandise between the two countries.

**The Peace Settlement.** Meanwhile, the Council of Foreign Ministers had begun the drafting of a peace treaty for Finland. Agreement on this treaty was reached more easily than on any other under consideration by the Foreign Ministers' Council.

The terms of the draft were made public on July 30, with only a few minor discrepancies between the Russian and British proposals remaining to be ironed out at the peace conference.

The treaty followed by and large the provisions of the Armistice. It sanctioned the cession of the Finnish port and province of Petsamo to Russia; confirmed the fifty-year lease for a Soviet naval base in the Porkkala-Udd area of southwestern Finland; and provided for the return to Finland of the peninsula of Hangoe, leased to the Soviet Union under the earlier peace settlement of March 12, 1940. The total amount of reparations to be paid Russia was confirmed at \$300,000,000, payable over a period of eight years as from September 19, 1944.

Finland's armed forces were reduced to a land army of 34,400; a navy of 10,000 tons, with a personnel strength of 4,500; and an air force of 60 planes, with a personnel strength of 3,000.

In the preamble to the draft treaty, the Allied powers recognized that Finland had "loyally carried out the armistice terms," and they promised to support Finland's application to become a member of the United Nations after the signing of a peace treaty.

On August 13, a Finnish delegation of 20, headed by Pekkala and including the Ministers Enckell and Leino, arrived in Paris to plead Finland's cause at the Peace Conference. At the send-off, President Paasikivi reportedly urged the delegates to "always have in mind that the present Finnish foreign policy aims at one thing, namely: to keep up friendly relations with Russia."

Both within the delegation and in Helsinki political circles opinion was divided as to which

would be the better course for Finland to pursue: accept without reservation the draft treaty prepared for her by the Council of Foreign Ministers; or attempt to obtain better terms in Paris, even at the risk of incurring Soviet displeasure. President Paasikivi favored the former course, Foreign Minister Enckell the latter, with Premier Pekkala trying to steer a middle course.

When Mr. Enckell, in his address to the Peace Conference on August 15 suggested "it would be well" if Finland's burden of reparations were reduced by \$100,000,000, he was promptly and sternly rebuked by Soviet Foreign Minister Molotov, who flatly refused to grant Finland any further alleviations, territorial or economic.

As a result of this clash, which pointed to a deterioration of relations with Russia, the Finnish delegation renounced its original plan of asking also for territorial concessions. It did, however, request a doubling of the air and naval forces provided in the draft treaty, on the ground that the country's extended coastline made patrolling difficult.

Overriding the Finnish objections, the Allied committee on Finland, on August 29, approved the principal articles of the draft treaty. The only change in the draft which was made on September 7, was the insertion in the Preamble of an Australian-sponsored addition, to the effect that the questions still outstanding should be settled "on the principles of justice." By that time, the Finnish delegation had already returned home, with practically nothing to show for its effort.

The draft treaty in its entirety was approved by the Peace Conference on October 14, after the Soviet Union by an 11 to 5 vote had won its point that reparations should be fixed at \$300,000,000. On the question of the amount to be paid by Finland for United Nations property damaged during the war, the French proposal for a 75 percent compensation was adopted over the 25 percent proposed by the United States and others.

The role played by the Finnish delegation at Paris did not strengthen Premier Pekkala's position at home and the resulting controversy for a while threatened to cause the fall of his government. The crisis passed, however.

The Government also weathered a fierce attack made on it by Rightist deputies, on November 5, on the ground that the political police had detained persons without due cause. A motion of censure was defeated by a vote of 93 to 72.

**The Aaland Question.** The question of enlarged home rule for the Aaland Islands group in the Baltic, with its compact Swedish population, came up again during the year. While the Aalanders did not again press for union with Sweden—as they had unsuccessfully done after World War I—they demanded the right to fly their own flag (in the Swedish colors), the privilege to refuse service in the armed forces of Finland, and a ban on the establishment of Finnish schools on the islands, without the consent of the local authorities.

A bill to this effect was approved by the Finnish Government on November 6 and sent to the Diet, where it was expected to encounter stiff opposition.

Complete demilitarization of the Aaland Islands, which had been stipulated by the international Aaland conventions of 1856 and 1921, was again agreed upon in Article v of the draft peace treaty, after the fortifications built during the war had been removed under the terms of the 1944 armistice.

**Production.** Agriculture is the chief occupation of the people of Finland, although the cultivated area

covers only 6.6 percent of the land. The principal crops of 1944 were, in tonnage: potatoes, 640,124; oats, 845,818; barley, 149,337; rye, 167,260. The total forest land amounts to 53,771,000 acres, with productivity on 42,206,000 acres. In 1943, 4,590 large factories, employing an aggregate of 186,948 workers, yielded an aggregate product of 38,476 million marks. In 1943 there were 431 saw mills.

**Foreign Trade.** In 1944 imports were valued at 8,919,600,000 Finnish marks (12,876,000,000 in 1943); exports, 6,580,000,000 Finnish marks (8,712,000,000 in 1943). In 1945 imports totaled 6,820,000,000 Finnish marks; exports, 11,471,000,000 Finnish marks, including 4,171,000,000 marks for war reparations.

JOACHIM JOESTEN.

**FIRE PROTECTION.** The rising trend of fire losses of recent years continued at an accelerated rate during 1946. The preliminary estimate of the National Board of Fire Underwriters of the fire loss for the year was \$561,487,000, as compared with the corresponding 1945 estimate of \$455,329,000. For purposes of comparison preliminary estimates of fire losses for the past ten years follow:

1937.....	\$254,959,423	1942.....	\$314,295,000
1938.....	258,477,944	1943.....	373,000,000
1939.....	275,102,119	1944.....	423,458,000
1940.....	285,878,697	1945.....	455,329,000
1941.....	303,895,000	1946.....	561,487,000

In the United States, Canada, Alaska, and Newfoundland there were at least 187 fires during 1946, each of which resulted in a loss of \$250,000 or more. This figure exceeds by 24 fires the high of 1945. Four general occupancy groups account for 72 percent of all the large loss fires reported to the National Fire Protection Association. Manufacturing plants suffered the greatest number with 49 out of the 187 total, followed closely by warehouses (including grain elevators) with 40. A newcomer in the higher brackets was the aviation field with 24 large loss fires, 21 of which involved aircraft fires in flight or at time of crash. An increase in the number of disastrous waterfront fires was noted. Over 50 percent of the large loss fires were primarily the result of inferior building construction. Lack of private fire protection facilities such as automatic sprinklers and fire detection and alarm equipment were conspicuous factors in a majority of cases. Failure to protect horizontal and vertical building openings was responsible for many severe losses.

The year was marked by three hotel fires resulting in substantial loss of life—the Winecoff Hotel fire in Atlanta on December 7 which took 119 lives, the LaSalle Hotel fire in Chicago on June 5 in which 61 persons were killed and the Canfield Hotel fire at Dubuque, Iowa on June 9 in which 19 persons died. As the year ended a national conference on hotel fire safety was being planned under the auspices of the National Fire Protection Association and with the cooperation of the American Hotel Association.

One of the most striking developments during 1946 in fire department operations was the widespread and growing tendency to shorten the working hours of firemen. It appears that the trend will continue very substantially throughout 1947. While some progress was made during 1946 in rebuilding the fire prevention inspection forces and procedures of many municipal fire departments, this very necessary function has been slow to return to prewar standards and in all too many cities, fire prevention activities still appeared to be a step-child of the

fire department rather than a most essential and effective part of the fire department program.

Fire departments throughout the country showed great interest in the use of water spray or "fog" as a means of extinguishing fires and also in the installation of two-way radio facilities.

Throughout the war years there was little progress made in building codes and fire prevention codes in cities, but during 1946 a substantial amount of interest and development took place. The National Fire Protection Association expressed the fear a year ago that building codes and other construction standards would be broken down substantially because of the tremendous pressure for additional housing. While this has occurred in some cases, it has not been as widespread as we feared. The conversion of many large old homes to rooming houses has brought serious life hazards and has been a matter of concern to most municipal building inspectors and fire chiefs.

The City of Milwaukee adopted a very interesting ordinance providing for a fine or jail sentence for any person who through careless smoking sets fire to a building. It was provided that copies of the new ordinance must be plainly posted in each sleeping room of all hotels, rooming houses and other places of public abode.

The long awaited revised edition of the National Electrical Code made its appearance late in 1946.

An interesting legislative development of the year was a decision of the Supreme Court of Texas which upheld the reasonableness of the adoption by reference of the Standards on Liquefied Petroleum Cases of the National Fire Protection Association.

A favorable factor in the overall picture was the steadily growing movement to educate the public in at least the fundamentals of fire safety. The spring Clean-Up Campaign and the observance of Fire Prevention Week were more extensive in 1946 than in any previous year. An important accomplishment was the issuance by the United States Office of Education of a Curriculum Guide to Fire Safety for Elementary Schools. Fire prevention education has always had good support from the newspapers, general and trade magazines, and now has a new ally in the radio. Nearly all the radio stations of the country cooperated during 1946 in the fire prevention campaign and many of them provided new and effective material. Winner of the international contest sponsored by the National Fire Protection Association for educational activities conducted during Fire Prevention Week was Memphis, Tennessee, winner also in 1945 as well as in certain previous years. Benton Harbor, in Michigan, and Jersey City, in New Jersey, were second and third respectively. In the Inter-Chamber Fire Waste Contest sponsored by the National Fire Waste Council of the U.S. Chamber of Commerce for year-round fire prevention activities, Atlanta, Georgia, emerged as winner of the grand award for its performance during 1945.

CHARLES SUMNER MORGAN.

**FISCAL SERVICE.** A division of the U.S. Department of the Treasury which consists of the following: Office of the Fiscal Assistant Secretary (Edward F. Bartelt); Bureau of Accounts (R. W. Maxwell, Commissioner); Bureau of the Public Debt (Edwin L. Kilby, Commissioner); Office of the Treasurer of the United States (William A. Julian, Treasurer).

**FISH AND WILDLIFE SERVICE.** The return of peace brought renewed opportunities for hunting and

fishing to millions of Americans and resulted in increased pressure on wildlife populations. Although the war years had introduced conditions unfavorable to wildlife, such as increased pollution of waterways, during this period the populations of game animals had some opportunity to restore former losses through the temporary reduction in hunting and fishing. But this respite came to an end even before the termination of the war, as the number of hunters and fishermen increased sharply. Not only are there more sportsmen, but many proposed postwar projects—like the large scale development of the nation's waterways—will inevitably decrease the areas suitable for wildlife. These conditions make ever more difficult the task of the Fish and Wildlife Service—to maintain adequate populations of wild animals, birds, and fishes for recreational and economic use.

One of the most important and far-reaching events of the year in conservation is the amended Coordination Act of 1946, known as the Act of August 14, 1946, Public Law 732. It provides that Federal and State wildlife agencies acting through the Fish and Wildlife Service shall be given opportunity to participate in planning when any major construction development affecting fish and wildlife in rivers, streams, or other waterways is undertaken by the Federal Government.

The year brought fresh confirmation of the success of the most ambitious experiment in salmon conservation ever undertaken—the transfer of all the salmon runs blocked by Grand Coulee Dam to new spawning tributaries downstream from the dam. For the second consecutive year since the relocation activities were terminated, the fish were allowed to pass upstream unhindered. Only a few strays proceeded upstream to Grand Coulee, the vast majority turning off and entering the tributaries to which the runs had been transplanted.

Federal fish hatcheries, of which there are 108, produced a total of 5,454,557,885 eggs, fry, and larger fishes during the calendar year 1945. During this period 7,600,000 fish were supplied for the stocking of farm ponds—an increase over 1944 of nearly 90 percent. In connection with the stocking of farm ponds, the Fish and Wildlife Service made 13,276 individual plantings during the year.

Under the terms of the Pittman-Robertson Act, \$2,260,000 was apportioned among the states for the restoration and development of their wildlife resources for the fiscal year beginning July 1, 1946. The funds for this cooperative restoration work are derived from an excise tax on firearms, shells, and cartridges. These funds are set aside in a special account, from which Congress each year authorizes the expenditure of a certain portion. The Federal allotment is then supplemented by the states, which contribute 25 percent of the cost of the projects. Thus supplemented by the states, the fund available for cooperative wildlife restoration projects during the fiscal year 1947 was more than three million dollars. All of the states participate in this program with the exception of Nevada, which has not yet passed required legislation.

The national wildlife refuges administered by the Fish and Wildlife Service are becoming increasingly important as safeguards for wildlife. These refuges now number 291 and comprise 17,819,495 acres. Approximately 58 percent of the acreage is set apart for big-game animals; the balance (except for a two-thousand-acre research refuge at Patuxent, Maryland) for waterfowl and other birds and general wildlife. During the year, the Migratory Bird Commission approved the addition of 341,324 acres to the refuge system.

In addition to protecting and increasing wildlife populations, wildlife refuges served many secondary economic and recreational purposes. Cultivation of about 30,000 acres of refuge lands by private individuals and refuge personnel in 1945 produced 489,223 bushels of grain and other crops. A total of 253,490 animal-use months of grazing was permitted on refuge grasslands, from which 13,589 tons of hay were harvested. Sale of timber from refuge lands in 1945 was more than double that of any previous year, and made a substantial contribution of materials to aid in the critical lumber shortage. Satisfactory water conditions and improved management conditions served to increase the number of fur animals on the refuges in 1945, when 235,722 surplus animals were removed. The total revenue from all economic uses of the national wildlife refuges was \$350,631, which was deposited in the United States treasury.

As wartime restrictions were relaxed, more and more people used the refuges for recreation. Sport fishermen took 772,849 fishes from refuge waters in 1945; commercial fishermen removed 894,358 pounds of "rough fish."

The importance of maintaining and enlarging the national wildlife refuge system as a stabilized protective measure for wildlife was emphasized by a sharp reduction in the continental populations of waterfowl. On the basis of its annual January inventory of migratory waterfowl in the United States, the Fish and Wildlife Service estimated the 1946 populations of these birds at 80,000,000, a decrease of 36 percent since 1944. With only two exceptions, all species of game ducks declined. The Canada goose populations of the Mississippi flyway were so seriously reduced that the species had to be given complete protection from hunting in this flyway during the 1946 hunting season. The principal causes of the losses among waterfowl were believed to be the unfavorable climatic conditions on the breeding grounds during the past two years, coupled with an excessive kill by the rapidly growing army of hunters. To meet the emergency presented by the diminishing flights of waterfowl, the Department of the Interior issued the most stringent hunting regulations since 1938, cutting the length of the season from 80 to 45 days, reducing the daily bag from 10 to 7 birds, and the daily possession limit from 20 to 14.

The Service's tabulation of figures received from Federal, State, and private agencies showed that populations of all animals classified as big game within the United States totaled 7,148,422 in 1943, compared with 6,748,424 animals in 1941, or a gain of 5.9 percent. These figures are the result of an inventory of big-game animals, taken annually under the sponsorship of the Fish and Wildlife Service.

Deer greatly outnumber all other big-game animals, the white-tailed, mule, and black-tailed deer together comprising 89 percent of all the large game in the country. At the other extreme is the woodland caribou, now on the verge of extinction within the United States, with only 15 animals reported.

The State with the largest big-game population in 1943 was Pennsylvania, with 1,104,655 animals, nearly all of which were deer. Michigan ranked next with 731,407, followed by Minnesota with 631,877, California with 597,625, and Oregon with 584,261. Kansas is the only State that has no big game.

During the fiscal year ending June 30, 1945, 8,190,901 hunting licenses and 8,280,232 fishing licenses were sold by the various states. These

figures represent an increase of 685,643 hunters and 449,755 anglers compared with the previous year. Sales of Federal migratory bird hunting stamps, which are required of all waterfowl hunters, numbered 1,725,505 during the 1945-46 hunting season.

Despite shortages of men and materials, the cooperative program for the control of predatory animals destructive to livestock and of injurious rodents resulted in a take of 117,204 predators, compared with 112,451 the previous year. Predators taken under this program included 108,311 coyotes, 1,557 wolves, 6,487 bobcats and lynxes, 730 bears, and 119 mountain lions. In rodent-control operations, 11,397,769 acres of infested lands were treated for the control of prairie dogs, ground squirrels, jack rabbits, field mice, and other destructive pests. In addition, 442,004 premises were treated for the control of the common brown and other house rats.

A total of 64,523 fur-seal skins were taken in the Government-administered sealing operations on Alaska's Pribilof Islands during the 1946 season. This represents a decrease of 12,441 skins under the 1945 take, the reduction being attributed to the late arrival of the seal herd at the islands, probably because of unusually severe weather the previous winter. The seal herd numbered 3,386,008 animals when the annual census was taken on August 10—an increase of 7.31 percent over the 1945 census. When the Federal Government assumed active management of the fur-seals in the Pribilofs in 1910, the herd contained only 132,279 animals. By careful conservation the herd has been developed to its present size and, at the same time, has produced 1,367,322 skins which have been sold for the account of the Government. Fur-seals, which have a soft and beautiful underpelage, are highly valued and the Pribilof Island herd is estimated to be worth in excess of \$100,000,000.

The Fish and Wildlife Service initiated an educational program for presenting the findings of research on fishery production techniques, sanitation, marketing, and cooking to the fishing industry and also for popularizing consumption of fishery products, through the use of movies, publications and demonstrations.

The Service also sought to improve utilization of the fishery resources by encouraging increased use of fish in the Federally aided school-lunch program; air shipment of fish and shellfish; quick freezing of precooked fish dishes; more extensive storage of fish in frozen-food lockers both at home and in locker plants; and greater utilization of fish and seaweeds as sources of amino acids, peptides, sterols, vegetable gums, drying oils, and other chemicals and pharmaceuticals.

ALBERT M. DAY.

**FLOOD CONTROL.** Increasing importance of flood-control measures and works is due largely to increasing frequency and intensity of floods, coupled with the fact that many open areas which formerly provided natural and harmless storage for flood waters are being limited and restricted by settlement and by industrial and agricultural development. The annual expenditures on flood control aggregate many millions of dollars and cover hundreds of individual works.

The Federal program for general flood control, exclusive of earlier projects on the Mississippi and Sacramento rivers, was begun in 1937, and by the end of June, 1946, there were 50 reservoirs and 135 local works completed in all parts of the country. The flood-control act of July 24, 1946, author-

ized \$772,000,000 for 123 additional works. However, under a government order limiting Federal works in order to permit of concentrating on the housing problem, flood-control expenditures for the fiscal year 1946-47 are restricted to \$135,000,000.

The authorized projects constitute a comprehensive plan, for many of the reservoirs may be utilized for river regulation, power development, or for other purposes, as well as for holding flood waters. Projects completed in 1946 include the Indian Rock dam in Pennsylvania and protective works at East Peoria, Ill. Many authorized works were halted during the war and resumed after its close, but under the order noted above they are again deferred. Those already under construction were not affected.

Floods may be due to long continued rains or they may be "flash" floods caused by sudden intensive rains or "cloudbursts" near or distant. An example of the latter is the September flood at San Antonio, Texas, in which several people were drowned, cattle were lost, property was destroyed, and torrential streams two to six feet deep flowed through the streets, while road, railroad, and airplane traffic was interrupted.

Detailed and continuous study of hydraulic and meteorological conditions and records are needed in planning relief and forecasting floods, and this work is covered by such organizations as the Tennessee Valley Association, the Los Angeles County Flood Control District, and many relating to specific areas, such as the Ohio valley, the Connecticut River valley and the Allegheny River valley.

During 1946, more than a dozen States experienced floods of more or less disastrous character, and control works are being planned and constructed in almost every State. For the control of the Illinois River there is a controversy between the government engineers and the local engineers. The former advocate reservoirs on headwaters of the tributaries; the latter object on the ground that large areas of good agricultural lands would be destroyed. They argue that a better plan would be to set back the levees along the river, thus increasing the flow capacity of the channel within established limits.

Where heavy floods are recurrent, as along the lower Mississippi, "floodways" or relief channels may be provided to divert excess flows into other streams. But in 1946 the Bureau of Reclamation warned residents of the upper Sacramento valley against constructing buildings or other improvements in the floodways of the Sacramento system. Flood control on this river by the Shasta Dam has been so successful that utilization of the low-lying floodway lands has been proposed. But it is pointed out that heavy flows of water may have to be discharged without much warning, in order to lower the water level and so maintain space in the reservoir to hold expected flood water.

At Fresno, Calif., a million-dollar project has been approved, after delay resulting from disputes over financing. Lowering the level of Lake Tahoe, in California, is an item in a large project, the purpose being to stabilize the level and so prevent recurring flood damages. For the control of flash floods in the basin of the Santa Ana River, also in California, the winding course is to be replaced by a direct course between earth levees and by a three-mile concrete channel 40 feet wide and 25 feet deep. For flood control on the Willamette River, in Oregon, a series of seven dams is proposed.

Water supply and flood control at Columbus, Ohio, are to be improved by one dam on the Scioto

and another on the Sandusky River. A drainage and levee system for the East St. Louis district, Illinois, is proposed to prevent such floods, caused by heavy rains, as produced great distress and property damage on August 14 and 15. In the case of a flood on the Susquehanna drainage area in May, it was estimated that the dams and channels already completed had greatly reduced the flood damage. Flood relief of Rome, Georgia, and regulation of the Etowah River are purposes of the Allatoona concrete dam, 48 miles above the city.

In China, a big project for 1946 was the repair of the dikes or levees along the Yellow River, which had been cut to flood the country and so halt the Japanese invasion. This work is largely in the hands of American engineers and was pushed so as to be finished before the next flood season. In India, a dam and reservoir are projected for the protection of Calcutta. See DAMS, WATER SUPPLY, METEOROLOGY.

E. E. RUSSELL TRATMAN.

**FOOD AND DRUG ADMINISTRATION.** The American consumer and the honest manufacturer of foods, drugs, and cosmetics are receiving greater protection than at any time since the original Food and Drugs Act of 1906 became law. A comparison of items on the shelves of grocery and drug stores in 1906 and 1946 reveals significant changes. Today unlabeled substitutions for foods and drugs and labels bearing blatant claims for incurable diseases are the exception. Labels have changed also in the information they furnish concerning ingredients and the safe use of the product. At no time in the history of Federal food and drug regulation has so much attention been concentrated on the fitness of raw materials and on sanitary handling at every step in processing and distributing merchandise.

Numerous industry groups under the leadership of trade associations waged sanitation improvement campaigns in 1946. Too many producers and handlers of foods, however, permitted their products to become contaminated by insects and rodents or used unfit raw materials. Filth and decomposition accounted for 70 percent of the 1946 food seizures.

The greatest number of food actions charging potential injury to health were caused by deleterious chemical preservatives added principally to beverages to prevent fermentation which could have been avoided by adequate sanitary precautions, and mineral oil substituted for food oil although it had been found to interfere with vitamin assimilation and cause other injurious effects. Mineral oil is only one example of violations which stem from economic developments, but directly affect public health. Others include low-fat butter, fruit deficient in fruit juices and occasionally sweetened with nonnutritive saccharin, and egg noodles deficient in egg, all seized in 1946.

Actions against adulterated drugs in most cases resulted from deviations in the proportions of ingredients, undissolved particles in injection drugs, or lack of sterility in surgical dressings. Violation of labeling regulations brought other drug actions. These included unjustifiable claims, often in accompanying literature; oral promotion by "pitchmen" for diseases not mentioned in the labeling; and retail druggists' sales of prescription drugs, such as sulfonamides and barbiturates, across the counter to laymen without prescription. Seizures of misbranded therapeutic devices increased materially in 1946; some bore unwarranted claims for such serious diseases as diabetes, blood poisoning, lung abscesses, and arthritis.

The use of nonpermitted coal-tar dyes accounted for the most serious violations in the cosmetic field. Other seizures involved cosmetics labeled with therapeutic claims that classed them with drugs.

The Food and Drug Administration's certification services cover coal-tar colors, insulin, and penicillin, all tested before distribution to assure purity and standard potency. A similar type of pretesting was conducted in 1946 under Civilian Production Administration allocation orders on all batches of streptomycin manufactured. New-drug applications requiring handling in 1946 numbered 174. Before a new drug may be placed on the market the manufacturer must demonstrate safety for use and the adequacy of manufacturing controls.

The resumption of imports from countries shut off during the war years from their customary trade created a major control problem. Excessive storage periods under inadequate protection and faulty production controls both led to an abnormally high percentage of rejections of items failing to meet American standards.

Total seizures of foods, drugs, cosmetics, and caustic poisons in the fiscal year 1946 were 2,835; criminal prosecutions numbered 350 and injunction petitions 36. Fines totaling \$166,746 were imposed by the courts in criminal cases terminated during the year, with fines of \$1,000 or more in 51 cases. Jail sentences were imposed upon 14 individuals, but where suspended for 5, with probation substituted.

PAUL B. DUNBAR.

**FOOTBALL.** The gridiron game enjoyed its greatest campaign in history during 1946 and reached an all-time high in popularity, with battles raging throughout the land from early October until the curtain fell on the numerous bowl games of New Year's Day. The year saw the breaking of all previous attendance figures in both intercollegiate and professional circles, the end of a three-year victory march by Army's fabulous gridiron machine and the advent of a new pro league to rival the old one.

Intercollegiate attendance figures increased as much as 48 percent, with 100,000 fans gathering in Philadelphia's Municipal Stadium to see Army and Navy in their traditional struggle, which perhaps was the most thrilling in the long service series. After rolling up a 21-6 halftime lead through the running and passing of Glenn Davis and Doc Blanchard, two all-time great stars, the Cadets won by 21-18. But the West Pointers played their hearts out to hold off an inspired band of Midshipmen, who just missed an opportunity for the biggest upset in football history when time ran out as they reached their foe's 8-yard line with four downs to go.

Except for rain, the U.C.L.A.-Southern California contest at Los Angeles would have outdrawn the service battle for 103,000 tickets had been sold, but the weather held the crowd down to 93,714 persons who saw U.C.L.A. triumph by 13-6 to clinch the Pacific Conference championship and earn the right to play in the Rose Bowl. Michigan, which had 86,000 at its Army game; Notre Dame, Ohio State, U.C.L.A. and Army each played to more than 500,000 fans during the season.

The National Professional League cashed in on the current sports boom and shattered practically all of its attendance records when a total of 2,671,696 fans turned out for 86 regular league and exhibition games, a gain of 39.2 percent over 1945.

Army, which had dominated the intercollegiate picture for two years, appeared headed for un-

disputed top honors again as the campaign progressed although storm warnings were coming out of South Bend, Indiana, where a rehabilitated Notre Dame squad—back under the guiding hand of the capable Frank Leahy—was getting ready to face the Cadets, meanwhile rolling over all other rivals. The two titans met in their epic struggle before 75,000—at the Yankee Stadium and the battle ended in a scoreless deadlock, the first time Army had failed to win in 26 contests over a period of three seasons.

The tie left the teams sharing the national football throne, but when the Cadets barely squeezed past Navy, which had lost seven games in a row, the West Pointers lost considerable prestige and left the Fighting Irish the Number 1 team of the land.

Near the close of the year, a joint statement from Notre Dame and West Point broke the startling news that the annual series, long dear to the hearts of every gridiron fan in the nation, would end with the playing of the 1947 contest at South Bend. Reason given was the belief that the game had grown beyond the control of the two great schools participating and might possibly be resumed at a later date if conditions warranted.

Davis, winner of the Heisman Trophy, and Blanchard were again the two big men of college football, while Earl Blaik, Army mentor, was voted the coach of the year, keeping his team up week after week in preparation for rivals who all pointed for their meetings with the powerful Cadets.

However, Army and Notre Dame had no monopoly on quality, for stellar individuals appeared all over the country. Georgia, with a truly great back in Charley Trippi, was rated best in the South and U.C.L.A. stood out in the Pacific Conference. Next were ranked Illinois, Big Nine winner for the first time since 1928; Michigan, Tennessee, Louisiana State, North Carolina and Rice Institute, which shared the Southwest title with Arkansas. Following them were Georgia Tech; Yale, with its most powerful eleven in years; Penn, Oklahoma, Texas, Arkansas, Tulsa, Delaware and Indiana.

Ranking high among the outstanding players were Johnny Lujack, Notre Dame's great field general; Burr Baldwin of U.C.L.A.; Dick Huffman of Tennessee, Dick Scott of Navy, Herman Wedemeyer of St. Mary's, Harry Gilmer of Alabama, Levi Jackson of Yale and Buddy Young of Illinois.

After the signing of a five-year pact between the Big Nine and Pacific Coast Conferences, Illinois was chosen to battle U.C.L.A. in the Rose Bowl on January 1, 1947, amid considerable outcry because Army was not selected. The Illini, paced by Young, surprised even their most ardent admirers by crushing the Bruins, 45-14, before 90,000 persons. Lone happy note of the day for followers of U.C.L.A. was a record touchdown run by Al Hoisch, who took a kickoff behind his own goal line and raced 103 yards to tally for a new Rose Bowl mark.

In other major contests on New Year's Day, Georgia beat North Carolina, 20-10, in the Sugar Bowl; Georgia Tech trounced St. Mary's, 41-19, at Houston; Oklahoma routed North Carolina State, 34-13, at Jacksonville; Rice blanked Tennessee, 8-0, at Miami; Arkansas and Louisiana State played a 0-0 tie at Dallas; Delaware conquered Rollins, 21-7, at Tampa for its twenty-fifth straight victory, and the West's Stars subdued the East, 13-9, in the Shriners' annual benefit game played before 62,000 at San Francisco.

The ninth North-South All-Star contest, played in December at Montgomery, Alabama, resulted in a 20-13 triumph for the South.

The professional game had a big upsurge with the debut of the All-American Conference as a rival to the old National League. The new circuit, with key spots in New York, Cleveland, Chicago, Los Angeles, and San Francisco, concluded its regular schedule with the New York Yankees capturing the Eastern Division title and the powerful Cleveland Browns taking the Western crown. The Browns then went on to conquer the Yanks, 14-9, rallying before 40,469 shivering fans in Cleveland's Municipal Stadium to become the first champions of the conference.

In the National League, the Chicago Bears won in the West and the New York Giants in the East then the Bears triumphed by 24-14 before 58,346 screaming spectators at the Polo Grounds to gain the league crown for the seventh time. A betting scandal that broke before the game took some of the edge off the victory and led to an investigation of New York gamblers when one was arrested for having approached two Giants in an attempt to have them throw the game.

Bob Waterfield of the Los Angeles Rams and Bill Dudley of the Pittsburgh Steelers, who announced his retirement from football at the end of the season, generally were acclaimed as the two foremost players of the National League and Glenn Dobbs of Brooklyn's Dodgers was the No. 1 player of the All-American Conference.

THOMAS V. HANEY.

**FOREIGN AGRICULTURAL RELATIONS, Office of.** A branch of the U.S. Department of Agriculture which has been collecting, analyzing, and disseminating information on foreign competition and demand for farm products and agricultural policy. Its primary purpose is to study the factors influencing the food supply and needs of foreign countries, competition, trade barriers, production and marketing, and other developments affecting American agriculture. It also directs and coordinates the participation of the Department of Agriculture in the reciprocal trade agreement program and in other international agreements affecting agriculture. Director: L. A. Wheeler.

**FOREIGN AID, Advisory Committee on Voluntary.** On May 15, 1946 the President revoked Executive Order Number 9205, and thereby terminated the President's War Relief Control Board upon its own recommendation. As of that date, Federal registration of voluntary agencies, engaged in foreign relief and the welfare of the Armed Forces of the United States was no longer required. At the time the President revoked the Board, he addressed a letter to the Secretary of State and Secretary of Agriculture wherein he suggested they jointly appoint a new Committee on Voluntary Foreign Aid to tie together the governmental and private programs in the foreign relief field and to continue the liaison, advisory, and consultative functions of the War Relief Control Board.

In response to the President's request the Secretary of State and the Secretary of Agriculture appointed Mr. Charles P. Taft, Chairman, and Mr. Chester Davis and Mr. William Batt, members of the Advisory Committee on Voluntary Foreign Aid. The Committee met and formally organized on July 10, 1946.

It is the purpose of this Committee to guide the public and the relief agencies in the appropriate and productive use of voluntary contributions for foreign aid. In order to effect the services offered, all agencies cooperating with the Committee will submit periodic records of their activities. From

time to time summaries of the information received will be published, and the records of the Committee are at all times open to public inspection.

CHARLES P. TAFT.

**FOREIGN AND DOMESTIC COMMERCE, Bureau of A.** Bureau of the U.S. Department of Commerce, charged with promotion and development of United States commerce. Its operations are (1) of a general economic character, such as reviews of broad trends and developments; (2) of specific, practical application to current business problems. It also serves as the direct liaison between American business interests and the Government. However, activities of the Bureau largely concerned the provision of a quick service of comprehensive reports on commodities and industries at the request of war agencies. The Bureau functions through six agencies—International Trade; Small Business; Domestic Commerce; Business Economics; Field Operations. Director: Amos Taylor.

**FOREIGN EXCHANGE.** Limited progress towards international monetary reconstruction was achieved during 1946. The International Monetary Fund and the International Bank for Reconstruction and Development completed their organization, but did not begin actual operations. The need for foodstuffs and other supplies for immediate relief in many countries was so great that they had a large import surplus without obtaining equipment for reconstruction. Trade and financial relations between the United States and the rest of the world were still greatly distorted by the aftermath of the war.

**Balance of International Payments.** During the first year following V-J Day, United States exports aggregated \$8,800,000,000, or twice imports of \$4,400,000,000. In addition, about \$2,000,000,000 of American-owned goods were disposed of abroad through the sale or transfer of military surplus and lend-lease supplies, as well as through distribution by the War Department of civilian supplies in areas occupied by our armed forces.

Foreign countries also remained abnormally dependent upon American shipping and other services, while American tourist expenditures abroad remained subnormal. The United States had an aggregate credit on account of international transactions in goods and services of \$7,300,000,000 for the year ended August, 1946, of which \$3,200,000,000 was donated through UNRRA, lend-lease, the armed forces and private channels. In addition, the United States Government advanced credits of \$2,700,000,000 to foreign countries through the Export-Import Bank, lend-lease and in connection with the sale of Government-owned surplus property abroad. This left \$1,400,000,000 due for net exports of goods and services that were paid for with gold, dollar balances and private capital transactions. The abnormal character of our international trade during this first post-war year is illustrated by the fact that exports of crude and manufactured foodstuffs constituted more than 25 percent of the total in the year ended August, 1946, as compared with 10 percent in 1939.

International transactions of the United States during the first three quarters of 1946 were summarized by the Department of Commerce as recorded in Table 1.

**Foreign Credits.** The largest international credit operation of the year was formally authorized on July 15, 1946, when a special act of Congress granted Great Britain a line of credit of \$3,750,000,000 available until the end of 1951. The Brit-

ish made an initial draft of \$300,000,000 upon this credit at once, and drew down additional funds later in the year. Under the terms of the credit, Great Britain was not required to reintroduce free convertibility of the pound sterling until July, 1947. Therefore, she continued to finance a large part of her trade deficit, especially with British countries, by further payments into "blocked sterling" accounts. Beginning with July, 1947, foreign countries that sell to Great Britain will be allowed to convert current sterling receipts into dollars if they so desire, under the terms of the credit agreement.

The Export-Import Bank became the major international financing agency during the year, following Congressional action in July, 1946 increasing its lending authority to \$3,500,000,000. A number of commitments were made by the Export-Import Bank for reconstruction loans to Europe, France being the chief beneficiary with \$1,195,000,000 of loans and commitments arranged following V-J Day.

A comprehensive financial agreement was reached between the United States and France on May 28, following conferences in Washington with a financial mission headed by Leon Blum. This agreement called for a new Export-Import Bank credit of \$650,000,000 at 3 percent, repayable over 25 years, and a line of credit of \$720,000,000 at an interest rate of 2 percent. This line of credit would cover lend-lease settlements between the two countries and purchases by the French Government of United States surplus property located in France. In addition, credits were to be given France for the purchase of up to 750,000 tons of merchant shipping from the United States Government.

**International Fund and Bank.** The inaugural meeting of the Boards of Governors of the International Monetary Fund and the International Bank for Reconstruction and Development was held at Savannah, Georgia, March 8-18. The United States Governor of the two institutions was elected chairman of the Board of Governors in each case, and Washington was made the site of the head offices of the two international agencies. Bylaws were adopted by the Governors to regulate their procedures. Executive directors of the Fund and Bank held their first meetings in May, electing Camille Gutt of Belgium as the Managing Director of the Fund and Eugene Meyer of the United States as President of the Bank. The International Bank formally began to function June 25, and the International Monetary Fund took the initial step towards beginning business by cabling members on September 12 requesting them to communicate the par value of their currencies within thirty days. Thirty-two of thirty-nine member countries notified the Fund that prevailing quotations for their currencies would constitute the initial par values, but China, Greece, Poland, Yugoslavia, Brazil and a few others requested more time for the determination of their initial par values, to which the Fund agreed. The initial parties are shown in Table 2. Actual foreign exchange operations of the International Monetary Fund were scheduled to start March 1, 1947, it was announced.

The National Advisory Council on International Monetary and Financial Problems, established under the terms of the Bretton Woods Act, met repeatedly during the year to consider proposals and applications for foreign loans. The Council coordinated policies governing financial settlements with foreign countries arising out of the war, formulated the views of the United States as regards the operation of the International Monetary Fund and the International Bank for Reconstruction and Development and took steps to prevent expenditure of the proceeds of foreign loans from intensifying shortages of critical materials within this country.

Evidence that the formulation of international lending policy of the United States was giving rise to friction was seen in the unexpected resignation of Eugene Meyer as head of the International Bank for Reconstruction and Development early in December. Mr. Meyer ascribed his resignation to the wish to turn over the presidency to an executive who intended to remain with the institution for some time, but the long delay in announcing a successor indicated that the president of the institution had been placed in an anomalous position because the National Advisory Council on International Monetary and Financial Problems held practical veto power over decisions of the Bank's management.

The Bretton Woods institutions thus did not play a significant practical role in international finance in 1946. Their contribution to monetary

stability was still potential rather than actual.

**Foreign Exchanges.** Foreign exchange dealings increased as the conduct of American foreign trade was shifted increasingly from Government to private channels and Treasury foreign exchange controls were relaxed. However, rates certified by the Federal Reserve Bank of New York were not available for a number of currencies, and quoted rates were of limited significance in the case of countries like China where inflation was rampant, and where the currency unit was traded in abroad at only a fraction of the official rate.

Canada reduced her official buying rate for one U.S. dollar from 1.10 to 1.00 Canadian dollar on July 5, 1946. This action was taken to prevent a rise in Canadian prices following the end of price control in the United States. Since Canada retained price ceilings, it was felt that it would be easier to make them effective if the Canadian dollar rate was raised. While the official quotation of the Canadian dollar was lifted to parity with the American dollar, the free market rate continued at a discount of several cents because offerings of Dominion currency in the open market in this country exceeded the demand. The Swedish Riksbank on July 13 reduced its buying rate for the U.S. dollar from 4.20 to 3.60 kronor, also for the purpose of protecting the Swedish economy from the inflationary price rise in the United States. Brazil abolished the official rate for the cruzeiro on July 22, and thereafter only the lower free rate was quoted.

Market quotations at the end of December for currencies on which certified rates were available in New York, compared with average quotations for the month of December, 1945, are shown in Table 3.

**Gold and Silver.** The decline in the monetary stock of gold of the United States that marked the war period was reversed in 1946. Moderate imports and releases from earmarked gold occurred as the return of foreign trade to private channels made it necessary for foreign countries to pay in cash for a larger proportion of their purchases in the United

States. During the war, lend-lease had made the balance of payments of the United States unfavorable on a cash basis.

The Treasury's buying price for new domestically mined silver was raised, from 71.11 cents to 90.5 cents a fine ounce by legislation signed by the President on July 31, 1946. Congressional enactment of this law broke the deadlock over the price of silver which had created a severe shortage of the metal in industry in the first seven months of the year. The market price of silver rose to 90 cents for a time, but by the end of the year had declined below this level on offerings from abroad and hesitation of domestic consumers to buy at this high price. The Congressional silver bloc had hoped that a huge foreign demand for silver would be generated because India, Great Britain, the Netherlands and other countries had borrowed 410,000,000 ounces of the white metal from the Treasury under lend-lease, which had to be returned within five to seven years after the end of the war emergency. But, as has happened before, instead of paying a high price for silver these countries took steps to end monetary use of the metal so as to secure a stock of silver for shipment to this country. India substituted nickel tokens for silver coins of small denominations, and Great Britain passed the Re-coinage Act replacing all silver coins with others of a copper-nickel alloy. The high price of silver in New York also attracted offerings of the metal from Russia, Mexico and Spain in the American market.

JULES I. BOGEN.

**FOREIGN FUNDS CONTROL.** A division of the U.S. Department of the Treasury, established in 1940 to carry out the economic and financial warfare programs of the Department under the Trading with the Enemy Act, as amended. In the post-hostilities period the Control has a threefold program: (1) to uncover cloaked enemy interests and establish measures for the protection of claims of the Federal Government and of private American creditors in blocked assets; (2) to eliminate existing German and Japanese economic and financial influence in this country and prevent postwar use

of United States banking facilities by enemy interests; and (3) to develop the necessary procedures for licensing the reopening of trade, remittances, and general financial and commercial relations with former enemy countries consistent with the Government's objectives in controlling their post-war developments. Director in 1946: Orvis A. Schmidt.

**FOREIGN LIQUIDATION COMMISSIONER, Office of.** The Office of the Foreign Liquidation Commissioner of the Department of State was created by Executive Order effective October 20, 1945, by merger of the Office of the Army-Navy Liquidation Commissioner and the lend-lease functions of the former Foreign Economic Administration. Mr. Thomas B. McCabe was named Commissioner by the Secretary of State. Mr. McCabe resigned on September 20, 1946, and the Secretary of State then designated Major General Donald H. Connolly as Commissioner and Mr. Chester T. Lane as Deputy Commissioner and Lend-Lease Administrator.

This office is the disposal agency for United States surplus property located outside the continental United States, Hawaii, Alaska (including the Aleutian Islands), Puerto Rico, and the Virgin Islands. The Surplus Property Act of 1944, as amended, provides in Section 32(b) that surplus disposals in the areas under the jurisdiction of this Office may be exempted from some or all of the provisions of the Act. The exemptions under this authorization are set forth in FLC Regulation 8, issued under the Act. Surplus property originally produced in the United States, under the Act and regulations, may be reimported only (a) by veterans and members of the armed forces for their personal use, (b) for the purpose of reconditioning for re-export, or (c) if declared essential to the domestic economy by the Office of War Mobilization and Reconversion and entered on Schedule A pursuant to Order 6, issued under FLC Regulation 8. Care, handling, and storage of surplus property is the responsibility of the owning agency until removed by a purchaser or abandoned. Except for bulk sales to foreign governments, disposals are negotiated by sales executed by field commissioners located in London, Paris, Rome, Cairo, Teheran, Manila, Shanghai, Tokyo, Guam, Sydney, Rio de Janeiro, Balboa, Recife, Trinidad, Reykjavik (Iceland), and St. John's (Newfoundland). In addition, a field commissioner for Military Programs and a field commissioner for Canada and North Atlantic areas operate through the Washington office. The Washington office formulates the policies and coordinates the global sales of the various field offices. Property is generally sold on a "where is, as is" basis, and therefore prospective customers are advised to inspect property at its location. As of December 31, 1946, property having an original cost of \$8,800,000,000 had been declared to the OFLC as surplus and it is tentatively estimated that approximately \$2,000,000,000 additional property will be declared surplus overseas. \$7,437,000,000 worth of overseas surplus had been disposed of on December 31. Total realizations as of December 31, in the form of cash, credit, and foreign currency, amounted to \$1,678,000,000.

The Lend-Lease Administrator is responsible for the final winding up of the lend-lease program, which has involved over fifty billion dollars' worth of lend-lease aid material since March 11, 1941. This involves directing the completion of "pipeline" deliveries (i.e. deliveries of goods which had been requisitioned under the Lend-Lease Act as of September 2, 1945 and which were later sold

to the requisitioning countries) and supervision of the negotiation of final lend-lease settlements. As of December 31, 1946, final settlements had been negotiated with the United Kingdom, France, Belgium, India, Australia, New Zealand, and Turkey. A number of settlement agreements with other major countries receiving lend-lease aid remain to be negotiated. When the material in the pipelines has been delivered, an operation involving a billion and a quarter dollars' worth of goods which were programmed but undelivered as of V-J Day will be completed.

DONALD H. CONNOLLY.

**FOREST SERVICE, United States.** A reappraisal of the forest situation in the United States, to bring up to date facts and figures on the extent and condition of the country's forest resource, was completed by the Forest Service in 1946. The survey indicated that total volume of standing saw-timber in the United States had declined 44 percent in 36 years. There had been a 9 percent decrease since 1938.

A marked decline in quality as well as in volume of timber growth also was reported. Trees of the more valuable kinds and of large sizes were becoming increasingly scarce; large areas of timberland had been taken over by inferior species or scrubby growth.

The Forest Service estimated the nation's total stand of saw-timber at 1,601 billion board feet. (Saw-timber means trees large enough and of suitable species to be sawed into lumber, whether used for that purpose or not.) More than half of the saw-timber was in what is left of the virgin forests, practically all of which are in the western states; and about one-third of the remaining virgin timber is of relatively low value types, such as lodgepole pine.

Total amount of wood of all kinds, including cordwood, taken from the forests annually for lumber, pulpwood, fuelwood, and other products was estimated at 12.2 billion cubic feet. Losses from fires, insects and diseases, and windstorms amounted to 1.5 billion cubic feet. Total annual drain on the forests, therefore, was 13.7 billion cubic feet. This was nearly balanced by an annual growth of 13.4 billion cubic feet, although it was pointed out that much of the drain is of high quality material, whereas the growth is generally of poorer quality.

However, in trees of saw-timber size, upon which most of the forest industries depend, annual drain was placed at 53.9 billion board feet, while annual growth was only 35.3 billion board feet. Sawtimber each year was thus being replaced by growth only two-thirds as fast as it was being consumed.

Because of the growing scarcity of accessible, merchantable standing timber, the Forest Service said, the United States faces several decades of limited supply of forest products. The timber shortage would be prolonged indefinitely, it said, unless an adequate forest growing stock was built up. For a strong, expanding national economy, the Forest Service declared, sound forest policy should look to a timber growing stock that would yield an annual crop twice as great as present saw-timber growth.

The Forest Service reappraisal included a survey of prevailing methods of timber-cutting throughout the United States. Only 23 percent of all cutting on commercial forest lands was found to be good; 25 percent rated as fair; and 52 percent was poor to destructive. Cutting practice was classed as good when it left the forest in condition

for vigorous growth of desirable species in the immediate future. Poor cutting practice was that which stripped the land of all present values without regard to the future, cut down young stands before they had reached the period of most productive growth, or "high-graded" the stand of the best species, leaving a residue of poor, low-value trees.

On industrial and other large forest holdings, 29 percent of the cutting was good or better; 32 percent poor to destructive. On forest lands in small ownerships (under 5,000 acres) only 4 percent of all cutting was good, and 71 percent was poor or worse. Since approximately 80 percent of the total commercial forest acreage in private ownership is in small holdings, it was apparent that here was the biggest problem. Commercial forest land in small holdings is divided among some 4,200,000 owners, more than 3,000,000 of whom are farmers.

The cutting practices on public forest lands were notably superior to those on private lands. On the national forests, 80 percent of the cutting was good or better; 19 percent fair; and only 1 percent was classed as poor. Cutting practice on state and local government forest lands rated above the average. Public forests, however, comprise only about one-fourth of the nation's total commercial forest area, and therefore cannot alone assure the country an adequate future supply of timber.

"Our nation's forest lands can be made eventually to furnish in perpetuity all the forest products we are likely to need, and even help in some measure to supply the needs of other countries less fortunate," said Lyle F. Watts, Chief of the Forest Service, "But the downward trend of our forest resource must be reversed. The scars of past misuse must be healed. Prompt action is needed to minimize the pinch of timber shortage in the years immediately ahead, and assure abundant supplies of timber for the more distant future."

**Annual Report.** The Chief of the Forest Service, in his annual report for 1946, listed the following as major needs in a program to build up an adequate growing stock of timber: more intensive protection against fire, insects, and tree diseases; more planting to restore depleted lands to productivity; less waste in the utilization of timber crops; and better cutting practice and forest management on all lands. Specific measures recommended included public control of timber-cutting sufficient to prevent the use of destructive practices and to keep forest lands in reasonably productive condition; increased public aids, through cooperative fire protection, reforestation, technical advice, and research, to encourage better management of private forest lands and more efficient utilization of timber crops; public purchase and management of critical watershed and other areas vital to the public interest, and of forest lands so depleted or so low in productivity as to be unattractive for private restoration and development. Public ownership was declared to be the only practicable way to assure stable ownership and satisfactory management for a large acreage that is obviously not suited to, or destined for, permanent private forestry.

The annual report also recommended an expanded program of forest restoration and improvement work, including public reforestation projects, construction of additional protection facilities, and measures to increase timber growth. Up to the present time, it said, virgin and natural second-growth timber has provided almost the entire supply of wood in the United States. Man has taken only a very minor hand in growing the trees. Natural processes however, are slow and do not always

result in maximum returns. By certain cultural methods, foresters can speed up growth and yield of desired products. "Cleanings" in young stands can favor desired species. Thinnings can be made to get the best spacing and increase growth rate of individual trees as much as 100 percent. "Sanitation cuttings" can remove diseased trees or trees of poor form that are wasting good growing space. Pruning of pole-size timber will result in growth of knot-free wood at a much younger age than would naturally occur. The report said there were several million acres in the national forests alone where timber stand improvement work would be a good investment.

**National Forests.** In recent years, the national forests administered by the Forest Service have supplied about 10 percent of the country's yearly lumber cut. With full development of their timber-growing capacity, the Forest Service believes the sustained annual output of the national forests can eventually be more than double. National forest timber is sold under a sustained yield policy, in which annual cut is kept in approximate balance with annual growth. With the growing scarcity of merchantable private timber, there was increasing pressure for liquidation of government-owned timber stands. The Forest Service adhered to its sustained yield policy, although limited overcutting was authorized where it could be done without jeopardizing the future welfare of communities dependent upon the national forest timber resource.

To help meet urgent postwar needs for lumber for housing, however, the Forest Service started an enlarged program of road construction to provide access to isolated stands of mature timber. A Congressional appropriation of \$7,000,000 for this work was supplemented by funds made available by the National Housing Agency.

In the last prewar year, recreation areas in the national forests were used by more than 10,000,000 visitors. Recreational use during 1946 was at rates exceeding the prewar figure.

More than 80,000,000 acres of national forest land are suitable for livestock grazing. Seasonal grazing on these rangelands plays an important part in the country's production of meat, wool, and leather. In 1946, the Forest Service issued permits to 30,330 owners to graze 1,290,332 cattle and horses and 3,896,258 sheep and goats. Many of the national forest ranges, however, were in run-down condition as a result of recurrent droughts or too heavy grazing in the past. The Forest Service is endeavoring to build up the depleted ranges through range reseeding, better handling of the livestock, or gradual adjustments in seasons and numbers of animals. Techniques for successful reseeding of deteriorated rangelands have been developed by the Forest Service, which hold great promise. Experimental reseeding in Utah and Southern Idaho increased range carrying capacity ten-fold.

With the cooperation of the Army Air Force, the Forest Service conducted extensive tests with helicopters to determine the possibilities for their use in fire control and other forest work. The tests, conducted in mountainous terrain in Southern California, indicated that aircraft of the hovering type have large possibilities for use in quick delivery of men and supplies to fires in isolated, roadless areas; for game counts, aerial mapping, scouting for infestations of insects and diseases, and for many other activities in forest management and protection. Chief drawback was the limited cargo or passenger carrying capacity of existing helicopter models.

**First Chief Forester.** The first Chief of the Forest

Service, Gifford Pinchot, died October 4, 1946, at the age of 81. America's first professional forester and pioneer crusader for conservation, Pinchot contributed greatly to the growth of the conservation movement during the past half century. His efforts were responsible in large measure for the development of the profession of forestry and of technical forestry education in the United States. As Chief of the Forest Service from 1905 to 1910, he laid the groundwork for the federal forestry program and set up many of the basic principles which guide that program today.

**World Forestry Organization.** The Forest Service gave active support to the international forestry agency which was set up in 1946 as a Branch of Forestry and Forest Products under the United Nations Food and Agriculture Organization. Chief Forester Watts served as a member of the international advisory committee which helped establish the Branch. Headquarters for the new world forestry agency were set up in Washington, D.C., with Marcel LeLoup of France, formerly Chief of the French Department of Waters and Forests, as Director General. Stuart Bevier Show of the United States Forest Service, for the past twenty years Regional Forester in charge of the national forests of California, was named deputy director and chief silviculturist. The organization planned to conduct surveys, establish world-wide forestry statistical services, provide technical advice to member governments, promote exchange of scientific information and personnel, and in other ways promote sound management and use of forest resources throughout the world.

**Personnel Changes.** During the year, the Chief Forester announced a number of changes in key personnel in the Forest Service organization. Perry A. Thompson, formerly Chief of the Division of Fire Control, was named Regional Forester for California. Philip V. Woodhead was placed in charge of the Southwestern Region (Arizona and New Mexico) and J. Herbert Stone was named Regional Forester for the Southern Region (Southeastern and Gulf States). Joseph C. Kircher, formerly in charge of the Southern Region, was loaned to the American Military Government as a forestry specialist in occupied Germany. George M. Hunt was named Director of the Forest Products Laboratory at Madison, Wisconsin.

**Publications.** With the cooperation of the Charles Lathrop Pack Forestry Foundation, the Forest Service in 1946 published a monograph, *Longleaf Pine*, which brought to culmination years of research work at the Southern Forest Experiment Station. The publication brought together all that was known to date on the characteristics and use of this important tree of the southern states, and its management for timber and naval stores. Another Forest Service publication of the year was *Water and Our Forests* (United States Department of Agriculture Miscellaneous Publication No. 600), a popular bulletin describing the relation of forests to water supplies and flood control.

CHARLES E. RANDALL.

**FOREIGN-TRADE ZONES BOARD.** A Board created under the Department of Commerce in 1934 to provide for the establishment, operation, and maintenance of foreign-trade zones in ports of entry of the United States. The Chairman is the Secretary of Commerce. The Staten Island Zone was reestablished during 1946.

**FORMOSA (Taiwan).** An island near the southeast coast of China. It was under Japanese control from

1895, when it was ceded by the Chinese to the Japanese, until V-J Day in September, 1945, after which the Chinese resumed the administration of the island. Total area, including the Pescadores: 13,889 square miles. Total population (Dec. 31, 1940): 6,077,478 (91.5 percent Formosan Chinese, 6 percent Japanese, and 2.5 percent aborigines). Chief towns (1935 census): Taihoku. (capital), 278,446; Tainan, 111,959; Keelung, 84,978; Takao, 83,735. Governor General: General Chen Yi (appointed November 1945).

**Events, 1946.** Formosa emerged from the Japanese occupation into a domestic economy burdened by a severe inflation and a shortage of trained reconstruction personnel. In late August the Chinese Government reported that General Chen's provincial administration was attempting to cover a budgetary deficit equivalent to U.S. \$57,000,000 by floating a public loan.

The efforts to revive Formosa's economy bore little success during 1946. After the return of the Chinese Administration, it was reported that of the 500 factories and mines taken from Japanese officials and civilians, 300 had been sold and 200 were in the process of nationalization. Sugar production reached only 86,000 tons in the period from August 1945 to August 1946. In normal times, Formosa was capable of producing more than 1,000,000 tons annually. Similarly, Formosa's coal output during early 1946 was 90,000 tons a month, compared to a monthly maximum 200,000 tons. Rice production in 1946 was estimated at 11,948,000 koku (5,119 bushels) compared to 14,757,000 in 1942.

The damage inflicted by the United States Air Forces made Formosa's industrial recovery a serious problem. Factories were primary targets during the wartime air raids. Installations and warehouses at the important harbors of Kaohsiung and Keelung were more than 90 percent destroyed.

**FOUNDATIONS.** As affecting the stability or even the existence of the structures they support, foundation works are of great importance. But being hidden and inaccessible their conditions can be ascertained only by difficult and expensive work. Mistakes or defects are thus left for possible future development. In these days careful study is given to the soils in which or on which bridges, large buildings, or other important structures are to be founded. In preparing to design some institutional buildings, in 1946, the State authorities of New York let a contract for thorough soil exploration and foundation investigation.

Design of foundations is a separate problem for each individual case and much ingenuity is shown in devising means of meeting requirements and avoiding methods of prohibitive cost. For example, soundings and borings for a New York building failed to disclose serious conditions which developed as construction proceeded, including deep masses of old concrete that had been deposited as filling in previous years. Special piles and pile-driving methods had to be devised in order to get the foundations through this obstruction.

Steel H-piles, 200 ft. long, driven thirteen at a time, form the foundations for a car-ferry pier in New York harbor. A rather new idea in pile driving is the use of an air jet, alone or in combination with the more usual water jet.

Failure of foundations may be disastrous, as in two such cases in 1946. In the harbor at Philadelphia, a large private shipping pier, surmounted by a warehouse, collapsed suddenly and sank into the water, with loss of life and property. This was at-

tributed to abnormally high tides which weakened the holding of the piles in the soft ground. In the case of a river bridge, one of the concrete piers settled and shifted out of position, dropping two spans. Here the failure was attributed to the deepening of the channel by dredging, thus exposing the heads of the foundation piles to the attacks of marine boring insects.

Foundation work often includes hazards, especially where excavation is concerned. For such work under compressed air, the use of helium-oxygen gas has been introduced as a measure of safety. There is also the hazard of gas pockets in the soil, and several such cases have occurred in Chicago in the sinking of caissons or wells for concrete piers. Such a case in September caused the deaths of three men working in a four-foot well about 52 feet deep.

A type of foundation that is being used to an increasing extent is made by driving pipes or tubes of steel or concrete, to be filled later with concrete. A variation of this system is the driving of steel or concrete shells some five feet in diameter, to be cleaned out and filled with concrete.

Deep foundations are of special importance. Concrete caissons for the Criminal Courts Building, in New York City, reached depths of 126 to 133 ft., and the piers of the new Topock bridge of the Santa Fe Railroad (See YEAR BOOK, 1945, p. 76) reached rock at 123 ft. A wharf at the San Francisco shipbuilding yard of the Bethlehem Steel Co. is founded on 108 steel cylinders, three feet in diameter, sunk to depths of nearly 200 feet. Foundations of a bridge over the Elk River in Oklahoma consist of pairs of concrete shafts built in open pits 45 to 59 feet deep. Column foundations for a factory in which heavy loads are carried by conveyors suspended from the roof framing, were formed by drilling holes three feet in diameter for filling with concrete. As the soil is a hard clay, the bottoms of the holes were enlarged by bell or tapering out to a base diameter of five feet, thus reducing the load per square foot. A pier at Algiers, La., is carried by pairs of concrete cylinders four feet and 4½ feet in diameter, in eight-foot lengths, extending above ground as supports for a floor-framing or deck of concrete caps and beams. In Europe, also, there is extensive use of foundations of steel or concrete cylinders three to four feet in diameter, sunk by loading. See BRIDGES, BUILDINGS.

E. E. RUSSELL TRATMAN.

**FRANCE.** A republic in western Europe. Area: 212,659 square miles. The estimated population (July, 1946) was 39,700,000, compared with (1936 census) 41,907,056. Vital statistics (exclusive of Alsace-Lorraine and Corsica) for 1943 (rate per 1,000): births 15.9, deaths 16.4; infant mortality 75 (deaths under one year per 1,000 live births).

Chief cities (July 1, 1945): Paris (capital) 2,877,992, Marseille 608,507, Lyon 468,159, Bordeaux 248,973, Nice 225,918, Toulouse 273,455, Lille 178,618, Nantes 195,887, Strasbourg 154,981, Saint-Etienne 174,987, Le Havre 105,712, Toulon 121,388, Rouen 108,968, Nancy 112,323, Reims 108,819, Clermont-Ferrand 124,456.

**Education and Religion.** No recent statistics on education are available. The French Government in 1945 announced various educational reforms. Among them were the creation of the National School of Government Service to replace the Free School of Political Science and the establishment of a new first grade in secondary schools. Roman Catholicism is the religious faith of most of the

people; there were about one million Protestants.

**Production.** In prewar times 38 percent of the population was engaged in agriculture, 31 percent in industry, and 11.5 percent in commerce. Land used for agricultural purposes in 1938 was equal to 62 percent of the total area. Exclusive of Alsace-Lorraine the yields of the main field crops during 1945 (in metric tons) were: wheat 4,201,000, potatoes 5,194,000 (1945), sugar beets 4,085,000. Other major branches of agriculture are livestock raising, dairying, vineyards, and fruit cultivation. In 1945 the output of wine totalled 27,520,000 hectolitres. Livestock (1945) 14,800,000 cattle, 6,900,000 sheep, 5,900,000 pigs, and 2,300,000 horses. Meat output (1945 est.): 1,000,000 tons.

Mineral and metallurgical output in 1945 (exclusive of Alsace-Lorraine) was as follows (in metric tons): coal 24,816,000, pig iron and ferroalloys 1,184,000, steel 1,608,000. In April 1946 the output of coal totalled 4,043,000 tons. The production of electricity (exclusive of Alsace-Lorraine) in 1945 totalled 17,200 million kwh. Based on the prewar value of output, the leading manufacturing industries were metal working, machinery, and metal products; food; chemicals; textiles; metallurgy; embankment work and stone construction; wood; rubber; paper, and cardboard; leather and hides.

**Defense.** Plans for the reorganization of the French armed forces call for a minimum of 65,000 men in the navy and 500,000 men in the army. According to a statement released (Dec. 23, 1945) by the French Ministry of Information, Gen. Jean de Tassigny has asked for 105,000 men to be stationed in France, 100,000 in North Africa, 120,000 in the Far East and the colonies, 120,000 troops for the occupation of Germany, and 55,000 military police. Men will be called for compulsory military service at the age of 19 and will serve for a period of 13 to 14 months.

**Foreign Trade.** As a result of the occupation of France by German armed forces during World War II, not many products were available for export in 1945. In the twelve months of 1945 the value of imports was 54,839,766,000 francs; exports, 11,396,858,000 francs. For the year 1944 imports were valued at 7,740,000,000 francs; exports, 23,964,000,000 francs. For the period January-July 1946, imports were valued at 129,623,455,000 francs and exports at 41,600,098,000 francs. The principal imports into France for consumption included wheat, corn, rice, vegetables, fruits and nuts, sugar, wines, hides and skins, cotton, wool, wood and cork, wood pulp, rubber, coal, petroleum, copper, machinery, oil-seeds, and chemical dyes. In prewar years the chief export products included wine, brandy and liqueurs, hides and skins, wool, cotton fabrics, rayon and silk fabrics, paper and cardboard, iron ore, iron and steel, metal manufactures, machinery, automobiles, vegetable oils, chemical dyes, and perfumery.

**Finance.** France's budget for 1946, according to estimates submitted to the finance commission of the Assembly on Dec. 6, 1945, will total 464 billion francs, including 200 billion for civil expenditure, 59 billion for liquidation of the war, 125 billion for military costs, and 80 billion for reconstruction. Budget (1945): revenue 172 billion francs; expenditure 384.3 billion francs. In 1944 revenue totaled 123.46 billion francs; expenditure 364.56 billion francs, including German occupation charges amounting to 198.7 billion francs. The internal public debt of France increased from 445.7 billion francs on Aug. 31, 1939, to 1,734.6 billion francs on Apr. 30, 1945.

Currency notes in circulation rose from 151.3 billion francs on Dec. 31, 1939, to 496.3 billion francs on Sept. 30, 1945. Notes of the Bank of France had to be presented for exchange against new notes between June 4 and 15, 1945. After that date old notes ceased to be legal tender.

The official exchange rates for the franc in 1945 (until December 27) were: 49.53 francs equal U.S.\$1; 200 francs equal £1 sterling. On Dec. 27, 1945, by a vote of 506 to 44, the National Constituent Assembly adopted a law for the devaluation of the franc, as follows: The French (metropolitan) franc was pegged at 119.10669 francs = U.S.\$1 and 480 francs = £1 sterling.

The Bank of France and four large deposit banks (Crédit Lyonnais, Société Générale, Comptoir National d'Escompte, and Crédit Industriel et Commercial) were transferred to state control on Jan. 1, 1946. Local and regional banks were not subject to nationalization, nor were commercial banks engaged primarily in foreign operations.

**Transportation.** The highway network of France extends for a total of 2,072,027 miles, made up of 49,821 miles of national roads controlled by the state, 155,831 miles of departmental roads administered by the departments, and 1,866,375 miles of local roads maintained by the communes. The main railway lines in France are operated by an autonomous government corporation organized through the amalgamation in 1938 of two systems owned by the government and four by private interests representing a total of 39,176 miles of operated trackage, mainly of standard gage. In addition there are a number of small private railways. On Jan. 1, 1946, 7,343 steam and 546 electric locomotives, 269,200 freight cars, and 14,300 passenger cars were in immediate working condition. French airlines operate networks in metropolitan France, and to North Africa, West Africa, the Near East, Madagascar, and other points in the world. There are 7,400 miles of navigable inland waterways, for the transportation of heavy bulk commodities. Fifty million metric tons were loaded on inland waterways in prewar years.

**Events: The Fourth Republic.** France in 1946 presented a spectacle of further frustration in foreign affairs and continued poverty and dissension at home, alleviated only slightly by gradual economic recovery and hesitant decisions regarding the structure of the new State. Gen. Charles de Gaulle, hero of the dark years, passed from the scene as an effective political figure. No one of comparable stature replaced him. Bitter rivalry and uneasy equilibrium among the MRP (*Mouvement Republicain Populaire*), the Communists, and the Socialists precluded stable unity and in the end brought to the helm an aging and discredited leader of a defeated party. The nation moved steadily toward a socialized economy, with the Communists emerging as the largest and most dynamic political group. The painful process of constitution-drafting led finally to a new charter. But the spirit of the new regime evoked troubled memories of the factions and feuds of the wasted years before the débâcle.

**Exit De Gaulle.** On January 20, 1946, De Gaulle, for the third time in nine weeks, resigned as President-Premier of the Provisional Government. His decision, which he pronounced "irrevocable," was a protest against Leftist demands for reduced military appropriations and for an omnipotent parliament. His public rôle thereafter followed a familiar pattern in the Third Republic whereby many leaders who had entered politics as radicals closed their careers as reactionaries.

The General remained in seclusion, but his more ardent followers soon resumed political activity under the leadership of René Capitant, representative of Strasbourg in the Assembly. De Gaulle's former Minister of the Interior, Adrien Tixier, died on February 18. Col. François de la Rocque, erstwhile leader of the pre-war *Croix de Feu*, many of whose members looked to De Gaulle as a new bulwark against Communism, died on April 28. The General's Secretary, Gaston Palewski, was reported in the spring to be urging him to return to politics. In early May De Gaulle cancelled an announced address in the Vendée, with some attributing his decision to charges of conspiracy and embezzlement brought against André de Wavrin, former head of De Gaulle's secret service. (Wavrin was dismissed from the Army, expelled from the Legion of Honor and subjected to partial confiscation of his property in late August.) On June 16 the General spoke in Bayeux in favor of a bicameral parliament and a "legitimate State," using the first person plural to refer to himself as had Marshal Pétain and the French kings. On July 26 he spoke again at Bar-le-Duc to urge an Anglo-French entente as a balance between America and Russia.

The formation of the "Gaullist Union for the Fourth Republic" was announced on August 10, with Capitant (defeated for re-election to the Assembly in June) as its chairman. The organization placed itself "resolutely above political parties," but in November nominated and elected a few candidates to the Assembly. De Gaulle on August 27 denounced the second draft constitution as providing for "weak government by Assembly." He was criticized by André Philip for meddling in politics without assuming responsibility. De Gaulle issued further denunciations of the draft on September 19 and October 9 and 11, thus breaking with the MRP. Following its adoption, he urged the election of deputies in November who favored its revision, contending that the document would produce impotence and anarchy, followed by despotism. By autumn De Gaulle was regarded as a "reactionary" by the Communists and Socialists, viewed with suspicion by the MRP, and ardently supported by the elements that had once backed Vichy. Only in the event of a sharp Right swing of French opinion could there be any prospect of his returning to an influential role.

**Liquidating Vichy.** Trials of collaborationists continued throughout the year, but at a slower tempo. Hubert Lagardelle, Pétain's Minister of Labor, was condemned on July 17 to national unworthiness, confiscation of property, and life imprisonment at hard labor. His major offense was the deportation of French workers to Germany. Former Premier Pierre-Etienne Flandin, Vichy Foreign Minister from December 13, 1940, to February 8, 1941, was brought to trial on July 23 in the Palace of Versailles on a collaboration charge. He lectured the jury for four hours on diplomatic history and was praised as pro-ally by defense witness Randolph Churchill. On July 26 the High Court of Justice condemned him to five years of national unworthiness, but at once annulled the sentence in view of his imprisonment since December, 1943.

**Gouin Cabinet.** De Gaulle's successor in the Premiership was Socialist Félix Gouin, Marseilles lawyer, chosen by the Assembly on January 23. His three-party Cabinet was constituted as follows:

**Premier and Minister of National Defense**—Félix Gouin, Socialist.

**Vice-Premiers and Ministers of State**—Francisque Gay, MRP, and Maurice Thorez, Communist.

**Finance**—André Philip, Socialist.

**Foreign Affairs**—Georges Bidault, MRP.

**Justice**—Pierre-Henri Tietgen, MRP.  
**Interior**—André Le Trocquer, Socialist.  
**Armies**—Edmond Michelet, MRP.  
**Armament**—Charles Tillon, Communist.  
**Agriculture**—Pierre Tangy-Prigent, Socialist.  
**Industrial Production**—Marcel Paul, Communist.  
**Education**—Marcel Naegele, Socialist.  
**Public Works and Transport**—Jules Moch, Socialist.  
**Communications**—Jean Letourneau, MRP.  
**Colonies**—Marius Moutet, Socialist.  
**Labor**—Ambroise Croiset, Communist.  
**Public Health**—Robert Prigent, MRP.  
**Reconstruction**—François Billoux, Communist.  
**Veterans Affairs**—Laurent Casanova, Communist.  
**Food**—Henri Longchambon, non-party.

Gouin warned the nation that the franc was in peril because of an anticipated deficit of 309 billion francs for the current fiscal year. He urged a reduction of the budget, particularly in military expenditures, stabilization of wages and prices, and a generally deflationary policy. At the end of January the Ministry of Colonies was renamed the "Ministry of France Overseas" as a symbol of the intention of the Cabinet to replace the former type of colonial administration by a "French Union" of self-governing units. At the same time it was decided to send Léon Blum to Washington to seek a loan. The Assembly voted confidence and authorized the Cabinet to reduce the budget without a parliamentary vote. In mid-February a reduced military program was announced, envisaging an Army of 400,000, an Air Force of 50,000, and a Navy of 45,000.

Blum reached Washington on March 16 and was soon joined by Jean Monnet, chairman of the General Planning Board. Bidault hinted that failure to secure a loan might oblige France to seek aid from Moscow, which had already agreed to ship wheat. Blum, speaking of his country as "a nation twice ruined in thirty years," indicated that France needed \$5,000,000,000 worth of American goods to modernize its industry. While the Socialists sought to placate Washington and London by abandoning demands for the dismemberment of Germany, Bidault reiterated that French security required the political separation of the Rhineland and Ruhr from the Reich. On May 1 Secretary Byrnes, in Paris for the meeting of the Council of Foreign Ministers, informed Bidault that the United States would grant financial aid.

**American Loan.** On May 28, Blum and Byrnes, now back in Washington, signed documents by which credits totalling \$1,400,000,000 were extended to France, including \$720,000,000 for 35 years at 2%, with repayments of principal not to begin until July 1, 1951, and \$650,000,000 from the Export-Import Bank for 25 years at 3%. The accord (text in *New York Times*, May 29, 1946) provided for a settlement of lend-lease obligations and sundry other claims and pledged France to make tariff concessions and espouse American principles of non-discriminatory multilateral trade. Gouin expressed gratitude. On his return to Paris, Blum denied that any military or political conditions were attached.

The accords were ratified by the Assembly, unanimously, on August 1 in a spirit of resignation rather than enthusiasm. Bidault warned that austerity would continue and that France must buy American tools and equipment, not consumers' goods. By November 15, the Ministry of Finance estimated that \$457,000,000 of the American credits had already been extended for American imports and that the planned purchase of \$900,000,000 worth of American goods would be completed during 1947. Whether the *quid* of French renunciation of autonomy in commercial policy would in fact result in the *quo* of restored productivity on a

scale which would promote prosperity and enable repayment to be made was still a matter of controversy at the turn of the year.

**Constitution Rejected.** Meanwhile the political pot boiled violently during the spring in the sequel to the completion by the Assembly on April 19 of the draft of a new basic law. The final vote was 309 to 249, with Socialists and Communists approving and the MRP and minor Right parties dissenting. The charter provided for a unicameral National Assembly, to be chosen for five years by "universal, direct, equal, and secret suffrage" of all citizens twenty years of age or older. A Council of the French Union, to be chosen for four years by the General Councils of the departments and overseas territories, was to be given purely advisory powers. The President, to be elected for seven years by a two-thirds vote of the Assembly, was to occupy a symbolic position comparable to that of the President of the Third Republic. The instability of Cabinets, always the bane of French politics, was to be remedied by restrictions on votes of confidence. Dissolution of the Assembly, to be followed by new elections, could be ordered by majority of the deputies or by the Cabinet with the consent of the Assembly's President, but the latter procedure was inapplicable during the first half of the five-year legislative term. The new Bill of Rights included *habeas corpus* and the right to employment and to public support in sickness and old age. (Text in *New York Times*, April 23, 1946.)

In the referendum campaign on the new Constitution, Maurice Schumann and other MRP leaders urged a "No" vote on the ground that in the absence of checks-and-balances the proposed structure would eventuate in irresponsible legislative omnipotence. Communists and Socialists favored the draft, but all three major parties agreed to continue their coalition. The League of the Rights of Man endorsed the charter as did the General Confederation of Labor, which urged its adoption "to defeat Fascism, put the trusts out of power, and insure the reconstruction of rations and supplies for the working class." On April 24 the Assembly voted, 487 to 63, to nationalize fifty of the larger French insurance companies, with shareholders to receive 3% government bonds in compensation. Gouin campaigned actively for the Constitution. The vote of May 5 resulted in 9,453,175 votes in favor and 10,583,724 against.

**Election of June 2.** Under existing law the defeat of the charter required the election of a new Constituent Assembly to draft another. The three parties of the coalition carried on together in the Cabinet but indulged in increasingly vehement public attacks upon one another. The result of the voting on June 2 in terms of deputies elected, as compared with party strength after the election of October 21, 1945, is shown in the accompanying table.

Party	Oct. 21, 1945	June 2 1946
MRP.....	141	160
Communists .....	148	146
Socialists .....	134	115
Radicals and Left Groups.....	85	89
Right groups.....	62	62

The victory of the MRP was substantial, representing an increase in popular votes from 4,580,222 to 5,589,213. The slight decline of Communist deputies was fortuitous, since Communist popular votes increased from 5,004,121 to 5,145,325. The rebuff to the Socialists was less substantial than was indicated by the number of seats lost. Social-

ist votes were 4,191,152 in 1945 and 4,187,747 in June, 1946. The minor Left parties were under-represented, since they polled 2,018,665 votes in 1945 and 2,299,963 in June, 1946. Total votes of Right groups were 2,365,921 as compared with 2,550,750 in 1945. Among minor items of interest were the defeat of two outstanding De Gaullists, René Pleven and Jacques Soustelle; the election of Henri-Honoré Giraud, Paul Reynaud, and Edouard Daladier; and the re-election of Pierre Cot, erstwhile Radical, who now ran on the Communist list.

**Bidault Cabinet.** The election was followed by a protracted political stalemate, since the Communists at first refused to join a Cabinet headed by the MRP, the Socialists refused either to continue the Gouin regime or to participate in a Cabinet excluding the Communists, and the MRP was reluctant to bargain with the Communists. On June 19, however, Foreign Minister Georges Bidault, ex-professor of history, liberal Catholic, journalist, hero of the resistance, and leader of the MRP, was elected Premier-President by a vote of 389 out of 545 in the new Assembly, with the Communists abstaining. Cabinet-making proved difficult. Edouard Herriot rejected Radical participation. The Communists and the General Confederation of Labor pressed for a 25% wage increase and organized mass demonstrations. Following promises of higher wages, Bidault formed a new coalition on June 24:

**Premier, Foreign Minister and Minister of Information—** Georges Bidault, MRP.  
**Vice-Premiers without Portfolio—**Félix Gouin, Socialist; Maurice Thores, Communist; Françoise Gay, MRP; Alexander Varenne, Democratic Union.  
**Finance—**Robert Schumann, MRP.  
**Justice—**P. H. Teitgen, MRP.  
**Interior—**Jacques Depreux, Socialist.  
**Defense—**Edmond Michelet, MRP.  
**National Economy—**François de Menthon, MRP.  
**Agriculture—**Tanguy-Prigent, Socialist.  
**Industrial Production—**Marcel Paul, Communist.  
**Education—**Marcel Naegelen, Socialist.  
**Public Works—**Jules Moch, Socialist.  
**Post and Telegraph—**Jean Letourneau, MRP.  
**Colonies—**Marius Moutet, Socialist.  
**Labor—**Ambroise Croizat, Communist.  
**Public Health—**René Arthaud, Communist.  
**Population—**Robert Prigent, MRP.  
**Reconstruction—**François Billoux, Communist.  
**War Veterans—**Laurent Casanova, Communist.

On June 26 the Assembly voted support of the Cabinet, 517 to 2. Bidault urged a speedy drafting of a new Constitution so that France might have a permanent government by fall. In July the Cabinet convoked a meeting of 150 representatives of labor, farmers, and employers in an effort to promote economic stabilization. The Ministers unanimously supported Bidault's contention that the Saar, Rhineland, and Ruhr should be separated from Germany and that France should receive increased shipments of German coal. On Bastille Day Winston Churchill, speaking in Metz, asked for a strong France, an Anglo-French entente, and a united Europe. On September 19 he repeated his plea in Zurich, arguing for German resurrection and a French-German rapprochement. The Constitution Committee of the Assembly meanwhile hammered out a new charter during August and September.

**Constitution Adopted.** The second draft Constitution of 1946, which won the support of all three major parties, was not radically different from the first. The new document of 107 articles (Text in the *New York Times*, October 1, 1946) opens with a reaffirmation of the rights of man and of the citizen, including equal rights for women "in all domains"; "the duty to work and the right to ob-

tain employment," regardless of origins, opinions, or beliefs; the right of trade-union organization and collective bargaining; social insurance; "free and secular public education," etc. Monopolies and public utilities "should become the property of the community." "France forms with the peoples overseas a union founded on equality of rights and duties without distinction of race or religion." "On condition of reciprocity, France consents to the limitation of sovereignty necessary to the organization and defense of peace."

Sovereignty is vested in the people on the principle of "government of the people, by the people, and for the people." The motto of the Republic: "*Liberté, Égalité, Fraternité*." A bicameral parliament is reestablished. The National Assembly is directly elected by all voters attaining their majority, but the mode of election, duration, and conditions of eligibility are fixed by statute. The upper chamber or Council of the Republic, to be not less than one-third nor more than one-half the size of the Assembly and renewable one-half at a time, is chosen by indirect election through communal and departmental units, with one-sixth of its members named by the Assembly via proportional representation. The upper house, however, is not a coordinate body, since (Art. 20) it cannot reject legislative projects of the Assembly but can only delay them and call for reconsideration. An Economic Council is provided for, to advise the Assembly and Cabinet.

The President is elected by Parliament for a term of seven years and is declared "re-eligible for election only once" (Art. 29). Members of French royal families are ineligible. The President is to designate the Premier, but Premier and Ministers are responsible to the National Assembly. "They are not responsible to the Council of the Republic" (Art. 48). Votes of confidence can be asked for only by the Premier "after deliberation by the Cabinet" (Art. 49). Such votes can be taken only after a day's delay. The Cabinet resigns only if an absolute majority of all the deputies vote non-confidence. Only in the event of two votes of non-confidence within eighteen months can the Cabinet, on the advice of the President of the Assembly, order the dissolution of the legislature, in which case the President of the Assembly assumes the Premiership and new elections take place "at least twenty days and not more than thirty days after the dissolution" (Art. 61).

The "French Union" comprises metropolitan France and overseas territories, under the Presidency of the President of the Republic. Its "High Council" consists of French and colonial delegations. Its "Assembly" consists half of representatives of metropolitan France and half of representatives of overseas departments, territories, and associated States. But these bodies have only advisory powers. The old Council of State or highest administrative court is replaced by a "Superior Council of the Magistracy." Amendments to the Constitution (with the republican form of government not subject to amendment) are made by an absolute majority vote of the Assembly, followed by a second reading and vote within three months "unless the Council of the Republic has adopted by an absolute majority the same resolution" (Art. 90), followed by a final bill "voted in the manner of an ordinary law," which is then "submitted to a popular referendum unless it has been adopted on a second reading by the National Assembly by a majority of two-thirds or been voted by a majority of three-fifths by each of the two houses."

On October 13 the electorate, somewhat diffi-

dently, approved this Constitution of the Fourth Republic. Almost one-third of the voters stayed home. Of those who expressed a preference, 9,200,467 voted "Yes" and 7,790,676 voted "No." Paris and the colonies voted in the negative. The heaviest affirmative votes were in industrial centers. Despite the appeals of party leaders, the Socialists and MRP voters were divided, with the Communists voting solidly for the charter.

**Election of November 10.** The first National Assembly under the new dispensation was chosen on the second Sunday of November. During the campaign the MRP flirted with De Gaulle and hinted at an anti-Communist coalition—"with Bidault and without Thorez," as Maurice Schumann put it. The Communists appealed for a united front of the Left. The Socialists refused to join either of their Cabinet partners against the other. The popular choice, in terms of deputies elected (from metropolitan France and Algeria), as compared with party strength in June, was as follows:

Party	June 8, 1948	Nov. 10, 1948
Communists .....	146	169
MRP .....	160	163
Socialists .....	115	103
Radicals and Left Groups .....	39	66
Right Groups .....	62	62

The victorious Communists polled 5,475,955 popular votes, the MRP 5,033,430, and the Socialists only 3,454,080, which was little more than the combined votes of the strengthened Right Groups (3,136,630). Thirty-three women, twenty-one of them Communists, were elected. While the Communists emerged again as the strongest party (although gaining only an additional 2% of all ballots case), the losses of the Socialists meant that the two Left parties no longer commanded an Assembly majority. The indirect election on November 24 of the Council of the Republic resulted in an upper chamber of approximately the same party composition as the Assembly.

**Deadlock: Blum Cabinet.** The new Assembly met on November 28 in an atmosphere of partisan friction. Bidault submitted his resignation, but no agreement had been reached regarding a new Cabinet. Despite the fact that the nationalization program of the MRP was sufficiently radical to provoke disapproval from the Pope, while the Communists were sufficiently conservative to frown on strikes, sponsor patriotism, and renounce all advocacy of proletarian revolution and dictatorship, the chasm between the two major parties had become wide and deep. The Socialists, standing between them, were split as to whether they should support either against the other. On December 4 Socialist Vincent Auriol was elected temporary President of the Assembly with the support of the Right and against Communist opposition. Maurice Thorez, Communist candidate for the Premiership, received 259 votes for this post on the same day, 29 short of the required majority. A dozen Socialists voted against him in spite of their party's belated decision to give him support. On December 5 the MRP candidate, Bidault, was likewise defeated, receiving only 240 votes.

Following protracted negotiations in which every proposed combination commanding a parliamentary majority was vetoed by one group or another, the 74-year-old Socialist leader, Léon Blum, was accepted as a compromise premier on December 12, receiving 575 votes with 8 for Robert Schumann and 7 blank. After an unsuccessful five-day effort to form a coalition Cabinet, Blum announced an all-Socialist Cabinet on December 16:

*Premier and Foreign Affairs*—Léon Blum.  
*State*—Guy Mollet and Augustin Laurent.  
*National Defense*—André Le Troquer.  
*Interior*—Edouard Depoux.  
*National Economy and Finances*—André Philip.  
*Four Year Economic Plan*—Félix Gouin.  
*Justice*—Paul Ramadier.  
*Agriculture*—Pierre Tanguy-Prigent.  
*Industrial Production*—Robert La Coste.  
*Public Works*—Jules Moch.  
*Education*—Edmond Naegelen.  
*Social Security*—Daniel Meyer.  
*Communications*—Eugène Thomas.  
*Public Health and Population*—Pierre Segelle.  
*Veterans and War Victims*—Max Lejeune.

The Cabinet was approved by the Assembly on December 17, 544 to 2, with 69 Rightists abstaining. Blum declared that he had been unable to unite the two great parties, MRP and Communist, "whose simultaneous presence in the government is both indispensable and impossible." He pleaded for compromise and warned of the danger of dictatorship in the event of paralysis of democracy. André Philip proposed measures to balance the budget during the first quarter of 1947 through abolishing 50,000 public jobs, raising taxes and reducing subsidies. The Assembly approved, 530 to 60 on December 22. A flat 5% reduction of all prices was ordered at the end of the month. On Christmas Eve the Fourth Republic came legally into being with the first session of the Council of the Republic. By a vote of 124 to 119, against the combined opposition of Socialists and Communists, the upper chamber on December 27 chose Auguste Champetier de Ribes (MRP) as its President.

**Mourful Interlude.** The Blum Cabinet was admittedly a stop-gap pending the election of the President of the Republic in January, after which new efforts would be made to restore a coalition. De Gaulle announced on December 28 that he would not be a candidate, since he had no desire "to preside, powerless, over the powerlessness of the State." Blum, whose leadership within his own party was by no means secure, was dogged by a dark Nemesis, as he had been when he first came to the Premiership in June, 1936. Then, confronted by the Fascist attack upon the Spanish Republic, he made himself in the name of "non-intervention" the unwitting agent of those who were to bring France to ruin. In December of 1946 he was faced by new controversies with Washington, London, and Moscow by virtue of French action in setting up customs barriers around the Saar. He was further confronted with tragedy in Indo-China in the form of an outbreak of large-scale fighting between French troops and the independence forces of Viet Nam. In ordering military suppression of the rebels, he made himself the unwitting agent of those French colonialists who had already provoked wholesale bloodshed in Algeria and Morocco and might yet lose the whole French overseas empire.

Yet the turn of the year found the Fourth Republic at long last established and the liberated nation committed to socialization and economic planning. In Blum's words: "We are convinced that reconstruction is incompatible with the old liberal economy and cannot be assured by the law of profit, by the free play of the law of supply and demand or free initiative or free competition. It entails, on the contrary, the subordination of all private interests to the collective interest and to collective direction."

Whether the new France in 1947 could lay the foundations of a viable collectivist economy and still preserve personal freedom and parliamentary democracy remained to be seen. The bitterness of

political conflict at home was enhanced by high prices, low wages, shortages of coal and foodstuffs, and production bottlenecks of all kinds. Diplomatic weakness and costly colonial warfare spelled new embarrassments abroad. Despite the accomplishments of the year, *La Grande Nation* had not yet emerged from the shadows. Its quest for a new dawn was certain to be troubled and painful.

FREDERICK L. SCHUMAN.

**FRANKLIN INSTITUTE.** The Franklin Institute of the State of Pennsylvania for the Promotion of the Mechanic Arts, founded in 1824, is devoted to the increase of useful knowledge, to the encouragement of invention and discovery, and to the education of the public in the achievements of science and industry. Its very title has always indicated a desire to do honor to Benjamin Franklin.

The Franklin Institute includes in its activities: publication of *The Journal of The Franklin Institute*, established 1862; lectures presented about twenty times a year by distinguished persons in science and industry; the Bartol Research Foundation which is devoted to research in pure science; the Biochemical Research Foundation devoted to the study of diseases from the chemical viewpoint; the Franklin Institute Laboratories for Research and Development devoted to applied research in the physical sciences for industry and government; the technological Library which now numbers 126,000 volumes and 40,000 pamphlets devoted to works of applied science and technology. The Library also contains a collection of patent literature. The research divisions, the machine shops, and the staff of the Institute all worked to the fullest extent in the war program.

Another important activity is the Committee on Science and the Arts, formed of 66 members of the Institute, which reviews in great detail many of the advances of science and technology. It recommends to the Board of Managers, those persons deserving the annual awards of the Institute, which are formally presented at Medal Day exercises in the spring. The Franklin Medal, highest award of the Institute, was presented in 1946 to Dr. Henry Clapp Sherman, Mitchill Professor of Chemistry, Columbia University, for his contributions to the science of nutrition, and to Sir Henry Thomas Tizard, president of Magdalen College, Oxford University, for his contributions to the science of aeronautics.

The Institute also maintains in its new building, erected in 1933 as a national memorial to Benjamin Franklin, a scientific and technological Museum containing thousands of active exhibits, the Fels Planetarium, an Observatory open to the public, and a Seismograph. To make Franklin better known and emulated, the National Franklin Committee was formed in 1941. Through its efforts information concerning all phases of Franklin's life is distributed free of charge.

The Franklin Institute membership now numbers about 5,500. The President, reelected in 1946, is Charles S. Redding; Secretary and Director, Henry Butler Allen. The Franklin Institute is located on the Benjamin Franklin Parkway at 20th Street, Philadelphia 3, Pennsylvania.

**FRENCH EQUATORIAL AFRICA.** A French colonial territory in north central Africa consisting of four colonies: Chad (461,202 sq. mi.), Gabon (92,218 sq. mi.), Middle Congo (166,069 sq. mi.) and

Ubangi-Shari (238,767 sq. mi), making a total of 959,256 sq. mi. Though administratively separate, the mandated area of the French Cameroun is included under this heading, with 166,489 sq. mi.

**Population.** On August 2, 1943 the population of French Equatorial Africa was 3,724,710, of whom 6,100 were Europeans, or .2 of one percent. In the Cameroun there were 2,700,000 natives and about 3,000 Europeans. Compared with Nigeria or the Belgian Congo these figures represent low densities. In the south and center there dwell Bantu Negroes, while in the north the natives are Sudan Negroes with strong Hamitic and some Arab intermixture. Those in the latter (and drier) region are largely Moslems; the Bantu in the wetter areas are pagans—except those few who have been converted to Christianity.

In general native institutions have been less disrupted than in the Belgian Congo or in West Africa. Educational opportunities are provided largely by missionary societies.

**The Country and Its Economy.** Along the coast and bordering the rivers in the interior there are extensive forests. In the northern part lies the Sudan with its open savannas, which shade off into steppe and desertic country as one proceeds northward into the Sahara.

The occupations of the inhabitants depend largely on these climatic conditions: tropical agriculture in the south and center, and more pastoral pursuits in the drier Sudan. The resources of French Equatorial Africa are very largely undeveloped. In the Cameroun there are a number of plantations, started by the Germans. For many years the French tried the system of granting large concessions to capitalist concerns, much after the fashion of Leopold II in the Congo. In recent years this system has been in less favor, because it failed to provide for an orderly and sound economic development or to safeguard the welfare of the natives. In the Cameroun the French Government has been bound to observe the terms of the Mandate (Class B) concerning monopolies, tariffs, native rights and so forth. During the war rubber production in the Cameroun was increased from 773 tons in 1939 to 3,000 tons in 1944. Other important exports from this territory are: peanuts, palm oil, hides, timber, cacao and coffee. From French Equatorial Africa come much the same products. Large numbers of cattle, sheep, goats, horses and camels are raised in the north, but are not exported for lack of a ready market. The colonies' mineral resources are believed to be valuable but have only begun to be exploited.

The value of exports from Equatorial Africa in 1942 was 469,314,000 francs, and of imports 778,358,000 francs. The relevant figures for the Cameroun in 1938 were 251,959,000 francs and 215,212,000 francs. The principal ports are Duala (Cameroun), Port Gentil, Libreville and Poinde Noire. The latter is connected with Brazzaville on the Congo by a railway (318 miles). There are 314 miles of railway in the Cameroun. In both the mandated territory and in Equatorial Africa there are several thousand miles of road, of which only a part is suitable for heavy, all-year traffic. New road links were built during the recent war to speed goods to the Middle East and Ethiopian fronts.

**Government.** French Equatorial Africa is administered as a unit by a Governor-General whose seat is at Brazzaville and who makes up a budget for the whole area. He is assisted by an administrative council. Each of the four colonies has a Governor to supervise local affairs. There are no really representative institutions, though the Free French re-

gime—to which the Negro Governor Félix Eboué declared the region's loyalty in 1940—enunciated policies looking toward the closer association of the native peoples with the rest of the empire. During the war Equatorial Africa played an important part by providing overland access to the Nile Valley and Middle East and by forming a territorial base for the de Gaulle regime at a time when France and most of her empire was in Axis or Vichy hands. Representatives were sent to the Consultative and Constituent Assemblies in Paris in 1945 and 1946. A powerful radio station was constructed at Brazzaville in 1942 for broadcasting in various languages to many parts of the world. In 1944 the budget was reported to be balanced at approximately 600,000,000 francs.

**Events.** As in the case of the other French overseas territories, French Equatorial Africa elected delegates to sit in the Constituent Assembly at Paris. Unhappily for the success of the plan to create a French Union of all the colonies, the home deputies took little interest in the chamber's discussion of colonial affairs. This indifference no doubt reflected the general apathy of the French people, who had too many troubles nearer home occupying their attention.

A panoramic view of the economic situation of Equatorial Africa emerged from a report presented by Governor-General Bayardelle on December 19, 1945, to the Conseil d'Administration. During 1945, he revealed, there was increased production in all items save rubber, where the impetus of wartime demand had subsided. Cotton showed marked progress, reaching an output of 22,000 tons. Palm oil and palmetto production was less satisfactory, but steps were being taken to expand their output greatly. During 1946 a refining plant for palm oil was put in service at Pointe Noire, effecting numerous economies in treatment and transport. A program was also announced calling for an expansion in production of vegetable oils in Equatorial Africa up to 150,000 tons a year. This was to be achieved by substituting scientific techniques of cultivation for the primitive methods of the natives. Experimental stations were to be set up, and new plantations were to be started as well as old ones expanded.

**French Cameroun.** When the League of Nations came to an end, to be replaced by the United Nations, it was inevitable that the question of the mandated areas come up for settlement. The general assumption was that the League mandates would be transformed into United Nations trusteeships. In the case of France, however, the plan to create a French Union, comprising all the overseas possessions, introduced a complication. In January French experts explained to the Trusteeship Committee of the United Nations Assembly in Paris that in the French-administered parts of the Cameroun and Togoland, the inhabitants had the same rights as Frenchmen—electing delegates to their own local councils and sending representatives to the Assembly in Paris. This statement was interpreted by some of the committee members as indicating virtual French annexation of the mandated areas, and loud objections were voiced.

This criticism apparently had its effect, for on February 6 the French Cabinet decided to submit the Cameroun and Togoland to United Nations trusteeship. This step could not be taken until after the United Nations had set up their Trusteeship Council, which they did only during the Assembly and Security Council sessions at New York in December.

ROBERT GALE WOOLBERT.

**FRENCH GUIANA.** A Department of France in northern South America, comprising the colony of French Guiana (7,720 sq. mi.; pop. 31,000) and the hinterland territory of Inini (27,020 sq. mi.; pop. 6,100). On March 14, 1946, the status of Guiana was changed from a colony to a department, effective January 1, 1947. In 1945, the penal settlement contained 1,543 men. In 1938, a French law dissolved the penal institution. Repatriation of the inmates was suspended during the war and resumed in 1946. Chief towns: Cayenne, capital, 11,704 inhabitants, Mana, Oyapock, St. Laurent, Sinnamary. Chief crops: rice, maize, manioc, cacao, coffee, bananas, and sugar cane. There are large forests rich in various kinds of timber. Gold mining is the chief industry. Silver, copper, iron, lead, mercury, and phosphates are found. Foreign trade (1944): imports 128,244,611 francs; exports 38,396,333 francs. The budget (1945) was balanced at 64,462,051 francs. For the territory of Inini the budget (1945) was balanced at 6,073,900 francs. Shipping (1944): 94 vessels entered and cleared. Administration is controlled by a Governor, assisted by a privy council of 7 members. There is a Council General of 12 members who are elected by French citizens living in the colony. The territory of Inini is under the direct administration of the governor of French Guiana, assisted by an administrative council of 4 members acting in an advisory capacity. Governor, Jean Rapenne (appointed March, 1943).

**FRENCH INDIA.** The five French colonies in India—Chandernagor, Karikal, Mahé, Pondichéry, and Yanam. Area: 196 square miles. Population (1941): 323,295. Capital, Pondichéry: 53,101 inhabitants. Education (1944): 67 primary schools and four colleges; 13,179 students. The chief crops are rice, manioc, and groundnuts. There are cotton and jute mills at Pondichéry and Chandernagor. Trade at the ports of Pondichéry and Karikal (1944): imports, 158,000 francs; exports, 174,000 francs. Shipping (1944): 64 vessels entered and cleared. There were 43 miles of railway open to traffic. Budget (1945): 4,170,000 rupees. The colonies are divided into 5 dependencies and 17 communes, having municipal governments. There is an elective general council. Governor: N. M. Jeandin.

**FRENCH INDO-CHINA.** A dependency of France, in southeastern Asia, comprising the divisions shown in the accompanying table. On July 30, 1941, the Vichy French regime signed a pact with Japan by which Japanese troops were allowed to occupy certain points in French Indo-China. On Mar. 10, 1945, the Japanese seized complete control of the country but after V-J Day, September, 1945, following the defeat of Japan, French officials resumed the administration of French Indo-China.

Chief towns (with 1940 population for Hanoi; 1936 figures for the rest): Hanoi (capital) 134,849, Binh-Dinh 147,199, Cholon 145,254, Hai-

Divisions	Sq. mi.	Pop (1936)	Capital
Annam *	57,143	5,656,000	Huê
Cambodia *	69,884	3,046,000	Pnom-Penh
Cochin China *	25,096	4,616,000	Saigon *
Laos *	89,189	1,012,000	Vientiane
Tonkin (Tongking) *	44,784	8,700,000	Hanoi *
French Indo-China *	286,096	23,030,000	Hanoi *

\* Protectorate. \* Colony. \* Exclusive of the leased territory of Kwangchowan (309 sq. mi.; pop. 230,000 in 1936) which was returned to China by the French on Aug. 18, 1946. \* The capital city is Hanoi but during certain seasons of the year, when climatic conditions are oppressive, the government offices move to Saigon.

phong 122,000, Saigon 110,577, Pnom-Penh 102,678, Huê 33,222.

**Government.** Under French rule the administration of the whole of French Indo-China was headed by a Governor General and he was assisted by a Secretary General, a government council, and a grand council for economic affairs. Each of the four protectorates (Annam, Cambodia, Laos, and Tonkin) was headed by a Resident Superior and he was aided by a protectorate council and a council of economic affairs. The colony of Cochin China had a Governor at its head and he was assisted by a colonial council. Governor General: Adm. Thierry d'Argenlieu (appointed September, 1945).

**Events, 1946.** Indo-China emerged from the war-years into a conflicting situation, conditioned by an Annamese uprising and a variety of Allied occupation forces. After the end of the war, the British who had fought their way into Indo-China, found their troops inadequate in number and used Japanese soldiers to maintain immediate postwar order. At the same time, a part of the Japanese forces turned quantities of their arms and munitions over to the Viet Nam nationalist movement fighting for an independent Indo-China. Toward the end of 1945, France organized sufficient troops to relieve the British, and assumed control of their colony. The reestablishment of French forces in Indo-China led to repeated clashes with the insurrectionist movement, which at the outset reportedly suffered 4,000 casualties.

In March, 1945, France, aiming to reduce the potentially explosive situation, outlined the plans for a Federal Union in which Indo-China would have a federal government. In this new colonial concept, natives would hold citizenship status in Indo-China and the Federal Union and would be eligible for administrative positions in either governments. In addition, the French plan envisaged a state council, composed of Indo-Chinese and French members, authorized to enact legislation.

During the time following the defeat of Japan, a nationalist government, the Viet Nam Republic, had been operating north of the 16th parallel. The conciliatory attitude of France toward Indo-Chinese nationalism was greatly governed by the presence of more than 100,000 Chinese troops under General Lu Han, which occupied the territory north of the 16th parallel by Allied agreement for the purpose of disarming and repatriating the Japanese. Despite their officially neutral status, the Chinese disarmed French citizens and indicated approval of the nationalist uprising.

On February 28 France and China reached an agreement providing for the withdrawal of Chinese troops from northern Indo-China and the end of French extraterritorial rights in China. The evacuation clause required China to withdraw troops March 31. The Chinese representative, Foreign Minister Wang Shih-chieh reiterated the Chinese policy of nonintervention toward the Indo-Chinese internal disputes, but added that "the Chinese people are sympathetic toward the national aspirations of the Indo-Chinese."

In the terms of the treaty, France not only abandoned her extraterritorial rights and concessions in China, but granted China extensive privileges on the railroad connecting the Chinese province of Yunnan with the Indo-Chinese port of Haiphong.

During the occupation term of the Chinese, the Viet Nam Republic enjoyed the opportunity to strengthen its position and organize its government. In the infant republic's first election on January 6 under the aggressive leadership of President Ho Chi Minh, who claimed a following of

8,000,000 members of the Viet Minh coalition party, 400 representatives were elected to the National Assembly. All Annamites over 18 years old were eligible to vote for representatives, who had to be at least 23 years old and able to read and write. The election returns gave Ho Chi Minh's party an overwhelming victory with many votes coming in from clandestine balloting in French controlled southern Indo-China. The only parties involved in the election were the Viet Minh, a coalition of the most nationalistic elements, and the League of Annamite Revolutionaries. The Viet Minh program was mostly based on agrarian reform and independence from France. Ho Chi Minh made it clear, however, that he did not desire a rupture of all relations with France, but rather preferred "an economic compromise." He claimed that the French offered him a bribe to give up his fight and expressed the hope that the United Nations would intervene in Indo-China and stop bloodshed.

Recognition that France could satisfactorily occupy southern Indo-China was made by Lord Louis Mountbatten on March 4 when he announced that the Southeast Asia Command would relinquish control of the country and that Indo-China south of the 16th parallel "will be exercised solely by French authorities."

The French and Annamite Nationalists on March 6 reached an accord in which the Viet Nam Republic was recognized as a "free state within the Indo-Chinese federation and the French Union." Admiral d'Argenlieu, the French High Commissioner in Indo-China, announced that the treaty had been signed at Hanoi and that a plebiscite would be held to determine whether Cochinchina, Tonkin, and Annam would be included in the Viet Nam Republic. Altho Cochinchina was a French colony and Annam and Tonkin protectorates, the nationalists controlled Tonkin and the portion of Annam north of the 16th Parallel. Two days before the signing of the treaty, the Nationalist-controlled radio at Hanoi reported reorganization in the Viet Nam Government. The Constituent Assembly had approved a new "Government of National Union and Resistance," the radio announced, retaining Ho Chi Minh as President, but replacing most of the Cabinet.

The agreement stipulated that French troops were to withdraw gradually from the new state during a five-year period in which a temporary occupation force of 15,000 French and 10,000 Viet Nam troops would be under French command.

Precedence for granting the Viet Nam autonomy had been set in an agreement with Cambodia on January 6 when France gave this protectorate internal autonomy, but retained control of Cambodia's foreign affairs and defense.

The French concessions to the Viet Nam were a distinct effort to gain peace and enhance the possibilities of an amiable French Union, as urged by General de Gaulle a year earlier. A major obstacle to the projected French Union lay in the desperate economic conditions within Indo-China. It was estimated that between 800,000 and 2,000,000 people in northern Indo-China died from hunger in 1945. In January an Associated Press correspondent counted 400 dead in the environs of Hanoi alone. Little improvement occurred in 1946. In the early part of the year at least seven provinces in the Tonkin area of northern Indo-China were under water and thousands of acres of rice fields were inundated.

On the same day of the Franco-Viet Nam pact, French warships carrying more than 20,000 French

troops, exchanged fire with Chinese shore batteries in an attempt to enter the port of Haiphong. Both countries asserted that the other fired first and the Chinese Central News Agency explained that the incident arose from "technical difficulties" connected with the transfer of the port to the French. Apparently, the Chinese commander at Haiphong had not been properly informed on the provisions of the Franco-Chinese treaty. On March 8 French troops from Haiphong entered the Tonkin province, stronghold of the Nationalist movement without incident.

France and the Viet Nam Republic met in Paris in early July to establish agreement on the numerous issues that had arisen over the new nations economic and political relations with the proposed French Union. A month earlier France had granted Cochinchina independence within the Indo-Chinese Federation and announced that a referendum would be organized to determine whether the new country would join the Viet Nam Republic. Since Cochinchina was a large producer of rubber and rice, its status proved a key question at the conference.

After a drawn-out period of negotiations a provisional accord was signed on September 15 by Ho Chi Minh and Marius Moutet, French Minister of Colonies. Earlier, negotiations had broken off during the discussions when the Viet Nam delegation walked out in objection to a French action in convoking simultaneously a conference at Dalat in southern Indo-China for a discussion with Cochinchina, Southern Annam and the Darlac plateau of the French Federation. Though the details of the accord were not made public, Ho admitted that the agreement was not wholly satisfactory, but was "better than nothing." Agreement was not reached on the degree of independence the Viet Nam Republic could exercise within the French Union and the referendum plan anticipated for Cochinchina.

"We decided to facilitate the revival of French economic culture interests in Viet Nam in return for a promise that democratic liberties will be applied in Cochinchina," Ho explained.

As Viet Nam entered its first phases of autonomy and compromise with France, signs of internal unrest began cropping up. At Hanoi in mid-July the government made 200 arrests in a round-up of opposition leaders. Several were identified as leaders of the Quac Dong Dong party, the Government's most powerful opposition.

The outbreak of disorder and arrests was attributed to actions of the Annamite extremists who opposed the March 4 treaty with France and the concessions at Paris. The French plan for Cochinchina was also interpreted as a setback to the new nation's wide independence movement and an attempt to weaken the strength of Viet Nam by depriving them of an important granary of supply in Cochinchina.

A few weeks later a French convoy of trucks was ambushed near Hanoi. Twelve French soldiers were killed, forty-one wounded, and a \$140,000 payroll was seized. At the same time, the Annamite population of Saigon staged a two hour strike protesting the French-sponsored Republic of Cochinchina.

The complexity of the Indo-Chinese political situation was increased on November 10 with the discovery of the death by hanging of Nguyen Van Thinh, President of the Provisional Government of Cochinchina. President Thinh's death was attributed to suicide, induced by despondency over his country's political disunity. Dr. Le Van Hoach who was sworn in as Cochinchina's new President on

December 7, praised French aid to Indo-China and said that his administration was neither separatist or unionist regarding relations with the Viet Nam Republic.

As 1946 approached its end, clashes between the French and Viet Nam Nationalists grew in scope and violence. During late November the French Colonial Ministry in Paris reported Viet Nam attacks on French troops and small naval vessels, and the recapture of Haiphong airfield by French troops.

Full-scale guerrilla warfare burst into the open on December 20 when French troops and Viet Nam partisans clashed on the Annamite section of Hanoi, part of which was destroyed by fire. Ho Chi Minh, Viet Nam War Minister Nguyen Giap, and other Viet Nam officials reportedly fled from Hanoi on December 19 after Roger Santeney, French Commissioner of Tonkin protectorate was seriously wounded. As French sources reported other Viet Nam attacks on French garrisons in the Hanoi area, General Louis Morliere, commander of French troops in Tonkin, assumed control of the Government, and proclaimed martial law. On December 21 warfare spread to all major cities and towns of northern Indo-China as fighting continued in Hanoi with the French using aircraft and armored vehicles. Unofficial estimates put Viet Nameuse forces at between 60,000 and 80,000 and French forces at 75,000.

Jan 1 1947

#### FRENCH ARE FORCED BACK IN FRENCH INDO-CHINA

Premier Léon Blum told the French Assembly on December 23 that the situation in Indo-China was "not alarming but serious," and reaffirmed France's recognition of an independent Viet Nam. Within the next two days Major Gen. Jacques-Philippe Leclerc, expert on mobile warfare, and a crack regiment of French paratroops, based in Algeria, departed for Indo-China. In Saigon, Indo-China, Admiral Thierry d'Argelieu, French High Commissioner for Indo-China, announced that

"France does not intend in the present stage of evolutions of the Indo-Chinese people to give them total and unconditional independence, which would be an action gravely prejudicial to the interests of both parties."

On December 15, Ho sent a message to Léon Blum, Provisional President of France, proposing:

"1. On Viet Nam side, to invite the evacuated population to go back to the villages, to take all necessary measures to insure return to normal economic life in villages at present troubled by state of hostility, to make measures of self-protection taken by the population to cease, and insure return to normal of traffic between Hanoi-Haiphong and that of Hanoi-Langson;

2. On the French side, the return of French troops and Viet Nam troops to the position they had before Nov. 20 at Haiphong and Langson and withdrawal of reinforcements recently sent to Tourane contrary to our agreement, cessation of so-called clearing-up operations and repression campaigns in Cochinchina and South Annam

3. On both sides, make organism provided to apply 'modus vivendi' come into function immediately . . . and put an end to all unfriendly propaganda on French and Viet Nam radio and in press."

Persistent rumors from the obscured political situation in Indo-China placed responsibility for the Viet Nam attacks on the French on Ho Chi Minh's Minister of Defense, Nguyen Giap, who was said to have gained control of the army. On December 26 Premier Blum said that negotiations with Viet Nam could not be resumed until order had been restored in northern Indo-China. From Suigon, Minister Moutet reported that the military situation was "well in hand."

In the last days of December the revolt against the French spread to southern Indo-China and Cochinchina while Viet Nameuse continued their offensive operations against the isolated capital of Hanoi.

**Production.** The chief agricultural products are rice, maize, pepper, spices, tea, kapok, groundnuts, copra, and rubber. Eighty-six percent of the crop areas is devoted to rice. The forests in the north produce tropical hardwoods, bamboo, herbs, and essential oils. Fishing is an important native occupation. Included in the minerals produced are anthracite, gold, chromite, manganese, tungsten, antimony, tin, zinc, and iron.

**Foreign Trade.** In 1942, imports were valued at 1,378,000,000 francs; exports 2,471,000,000 francs. Imports included cotton and silk tissues, metal goods, and motor vehicles. Chief exports: rice, rubber, fish, coal, pepper, cattle, hides, corn, zinc, and tin ore.

**Finance.** There is a common budget for the whole of French Indo-China and a separate budget for each of the states. General budget (1941): 1,290,-147,500 francs; extraordinary budget (1941): 189,-337,800 francs. On Jan. 1, 1941, the outstanding debt of French Indo-China totaled 2,515,894,110 francs, including government loans and loans for the purchase of railway material.

JOSEPH P. BLANK.

**FRENCH LITERATURE.** Two years after the liberation of Paris and the uncritical enthusiasm which then acclaimed French books newly rediscovered, France seems to remain the most active creator of new works and sower of new ideas in Europe. Some of this intellectual effervescence is no doubt superficial: it is due in part to the escapist desire to forget pressing material difficulties or to the inflationary boom which has made books and works of art the most avidly sought merchandise next to food. Yet when the exceptional circumstances are discounted, it remains true that France is undergoing a remarkable literary renaissance; the names of young men of high promise ready to replace the

fading celebrities of authors in their fifties or sixties are legion.

**Personalia and Literary Events.** Striking details of French literary life, such as academic elections, prizes, polemical debates between writers, continue to make front-line news in France, competing often successfully with announcements of the peace conference, economic changes, political speeches, and votes on the Constitution. Existentialism is, in France, and in New York too, being as widely discussed as Surrealism, Cubism, and even Communism ever were, a decade ago. Articles from literary and artistic reviews are debated in cafés. *Les Temps modernes*, J. P. Sartre's review, *La Nef*, *L'Arche*, *Etudes* and the more traditional *Revue de Paris* are the chief literary periodicals: *Quadrige* and *Elites françaises*, along with *Verve*, recently reborn, and *Cahiers d'art*, a luxurious publication, appeal to amateurs of painting as well as of literature. *Confluences* and *Fontaine* have, however, suspended publication.

The French Academy undertook to strengthen its prestige by electing new and younger talents. Claudel and Romain were its outstanding choices in 1946; the election of Pagnol, the dramatist and film writer, surprised the more conservative elements of academic tradition, and that of Charles de Chambrun disappointed those who contend that only writers should belong to a literary assembly. The other new Immortals are an able historian of Asia, René Grousset (whose recent *Bilan de l'histoire* is reminiscent of Michelet and Tocqueville in its breadth of vision), Robert d'Harcourt, an able historian of Germany, Henri Mondor, a renowned physician who is also an interpreter of Mallarmé and Valéry, Maurice Garçon, an eloquent lawyer. George Lecomte succeeded Duhamel as "Perpetual" Secretary. Literary prizes aroused much attention: they went chiefly to novels and will be mentioned under *Fiction*. A few of the collaborationist writers whose trials had been delayed have been sentenced to various terms of "national degradation" or of prison: André Demaison, Bernard Fay, André Salmon. Others, acquitted by the courts (Montherlant, Giono), are free and again writing, though no longer the public's favorites. A young poet and philosopher of great promise, Henri Mougin, died as a result of years of debilitating captivity. Among the older writers, few have retained great prestige with the coming generation. Gide seems to have exhausted his inspiration if one may judge by his mediocre *Thésée*; a successful film was made of his old novel, *La Symphonie pastorale*. Mauriac continues to prefer journalistic writing to fiction, but his articles, collected in a volume, *Le Baillon dénoué*, have merely ephemeral interest. Romain and Maurois, who went back to France after several years spent in America, found themselves out of tune with the public taste. Malraux, Sartre, Camus, Paulhan are the leaders of youth.

**Poetry and Drama.** Poetry has now lost the predominance over the other kinds of writing that it enjoyed during the war years. Aragon's muse is silent; Supervielle published the result of his recent inspiration in *Poèmes 1939-1945*, disappointing after his *Fable du monde* of 1938. Eluard is the most widely loved of the French poets: his *Poésie interrompue* indicated his orientation toward a purer, more humorous, and more difficult poetry, after his deeply moved and moving *Résistance* verse. Reverdy, a great but little-known poet, gathered his early verse in *Plupart du temps*, an impressive collection. Henri Mougin, in *Trois Bornes de cristal*, and Jean Cayrol, in *Poèmes de*

*la nuit et du brouillard*, both prisoners of war for four long years, are the most brilliant newcomers to the ranks of French singers. Other poets of acknowledged importance have published only prose works this year: P. J. Jouve, *Défense et illustration*, Aimé Césaire, the gifted and colorful Negro poet from Martinique, *Les Armes miraculeuses*, Henri Michaux, *L'Espace du dedans*. Césaire and another Negro poet from Senegal, Senghor, have been praised as the most eloquent orators of the French Constituent Assembly, to which they are both deputies.

Few outstanding plays have been acted in Paris in 1946. Sartre, and Camus, whose *No Exit* and *Caligula* are being brought to the New York public, have published one more recent drama. Simone de Beauvoir, the leading woman among the Existentialists, scored only a moderate success with *Les Bouches inutiles*. Older plays were revived with skill by famous producers like Baty (Mussé's *Lorenzaccio*), Dullin (*King Lear* and *Le Faiseur*, adapted from Balzac's *Mercadet*); two plays by F. Garcia Lorca were translated from the Spanish, as were two of Calderon's dramas. The Odéon theater is being completely renovated under a new name. André Obey was appointed to rule over the Comédie Française: he will be advised by an artistic committee including Juvet, Baty, Pierre Dux and Robert Kemp. New financial measures taken by the oldest of French national theaters caused a substantial number of resignations among the actors: new appointments may bring about a welcome break with age-old acting traditions.

**Fiction.** Publishers who three and four years ago feared for the future of the novel, since the public then found solace in poetry, must be reassured by the present renewal of interest in works of fiction. Towering above all other recent works is Sartre's *Chemins de la liberté*: in philosophical content, in variety, and subtlety of psychological analysis, in mastery over plot and concrete evocation of life, in technical skill, it is probably the most important saga-novel since Proust. French readers have acknowledged its merits but have been divided on the moral value and on the possibly harmful influence of a work which does not ennoble life. Other important novelists, who are at work on forthcoming volumes, remained silent in 1946: Camus (whose *The Stranger* was published in New York in translation), Malraux, Martin du Gard. The latest volumes of Romain's long series have aroused little attention. Surrealism has praised, too lavishly in our opinion, two attempts at supernatural fiction by Julien Gracq, whose gift is chiefly that of a stylist. One of the finest and most delicately moving novels of the year is *Le Mas Théotime*, by Henri Bosco, a sort of French *Wuthering Heights* laid in Provence: it received the Théophraste Renaudot prize.

The Goncourt prize was granted twice: for the current year and to replace the 1940 prize, omitted on account of circumstances. J. L. Bory's *Mon Village à l'heure allemande* is an amusing, though hardly convincing or edifying, sketch of village life under the German occupation. Ambrière's *Les Grandes Vacances* is more solid and more serious: its title refers ironically to the author's long internment in a German prison camp. The Théophraste Renaudot prize for 1940 went to a realistic and unforgettable delineation of the horrors of a camp for civilian deportees: *L'Univers concentrationnaire*, by David Rousset, a French Protestant long an inmate of Buchenwald. Roger Vailland has drawn an ironical and lively picture of French youth in the Resistance in *Drôle de jeu* (Prix Interallié). The

French Academy crowned a traditional novel of provincial life, *Fontagne*, by Jean Orieux. The Grand Prix de la Libération went to a short story, *Frères partisans*, by Raymond Gabriel, both of whose parents perished in a deportees' camp. The Prix de la Pléiade was bestowed upon an epic novel in verse, *Terre du temps*, by a former industrial worker who became a priest, Abbé Grosjean. Other novels of note are: *Parenthèse* by J. Lemarchand, *Départ dans la nuit* by E. Bove, *Le Solitaire* by M. Blancpain, *Le Dernier des métiers* (a dark picture of the soldier's life) by J. L. Bost.

The vitality of the French novel has been stimulated by the extraordinary and fecund influence exercised by American fiction. As Russian literature appeared monotonous and often lifeless, and as English novelists now alive seem to lack the originality of their predecessors like Joyce, Lawrence, Virginia Woolf, the French have turned to Kafka, and to recent American writers. Faulkner's technique and vision have literally fascinated France and Europe. Erskine Caldwell, Henry Miller, Nathaniel West are also read with enthusiasm and more wildly praised than they ever were in their own country. The French have drawn from their American contemporaries a lesson of mastery over concrete and vivid details, a keen attention to sensations and thrills, a quicker manner of writing, akin to that of American journalists; they have repudiated their traditional emphasis on psychological analysis and a certain thinness of subject and content which has often impoverished French fiction. The ebullient life and even the morbid violence of American fiction are now being combined in France with a subtler technique and a restrained and selective style.

**Criticism, the Essay, and Historical Works.** The criticism published in several French reviews is surprisingly serious in tone and acutely penetrating, far superior to that of the prewar years. One almost wonders how creation can remain vigorous in the face of such pitiless analytical dissection. Robert Kemp, at times unfair in his irony, writes brilliant revaluations of past writers. Caillois and Monnerot practice the sociological study of literature, and do not escape the dangers to the sensuous enjoyment of beauty and to the perfection of style which it entails. Thierry-Maulmier seems more and more attracted by political thought. Schlumberger, in *Nouveaux Jalons*, pursues the tradition of the French moralists, made more austere by his Protestantism. Paulhan concentrates his vast erudition and his piercing logic on the problem of style and rhetoric. Claude Mauriac (the son of the novelist) extolled Balzac (*Aimer Balzac*) and attacked Cocteau. Mauriac himself was studied in two critical works by Joseph Majault and Georges Hourdin; but the definitive appraisal of his originality and of his art is still to be written. Valéry inspired several articles which attempted to assess the chances for survival of his impeccable poetry and of his polished but arid negations. The two finest critics of today seem to be Maurice Blanchot and Claude-Edmonde Magny, both steeped in philosophy. They do not spare their readers, and their comments on the books of the hour are as difficult as they are penetrating.

Literary history has also worked actively in 1945-46. New editions of the French classics, long out of print, have appeared. Baudelaire's poems have been copiously annotated by Crépét and Blin in a truly exhaustive edition. Vigny's life and works have been studied in two learned volumes by Lauvrière and his philosophical and religious attitude in a posthumous monograph by Bonnefoy,

killed in the war. Maurois in *Etudes américaines* and Coindreau in *Aperçus de littérature américaine* have tried to answer the eager curiosity of the French public about the literature of the United States of America.

The fashion for war literature and memories of heroic fights in the Underground has been short-lived. Parrot has summarized in a useful enumeration, *L'Intelligence en guerre*, the literary achievements of the war years. But the common reader prefers to turn to escapist novels, to translations of foreign works which reveal to him the outside world from which he was long shut out, and to books of a philosophical and speculative character.

**Conclusions.** This last feature is especially striking in postwar France. Philosophy has invaded literature: many novelists and poets were trained as teachers of philosophy. The most successful novels are pregnant with latent, and occasionally obtrusive, metaphysical implications: Sartre has coined the phrase "passionate geometries" to characterize the ideological essays by Camus and Bataille.

Three currents are clearly discernible in French thought and literature in 1946. (1) Extreme rationalism, deriding or denying mystery, confident in the power of science to enlighten men and to bring about an age of progress. This new positivism is closely allied to Marxism. It has attracted several of the most eminent Frenchmen of science (Joliot-Curie, Langevin, Prenant) and not a few philosophers (Friedmann, Garaudy, above all brilliant Pierre Hervé). Marxist materialists and positivists have celebrated with much *éclat* the memories of Voltaire, Lamarck, Anatole France. Their reviews are *Lettres françaises*, *La Pensée*. (2) Existentialism which, indirectly derived from an unorthodox and anguished Christian, Kierkegaard, groups many unbelievers who assert the meaningless absurdity of the world. They accept despair unflinchingly, refuse the comfort of irrational solutions, proclaim their metaphysical disquietude in moving terms. They might be called tragic humanists. While "widowers of God," in Sartre's phrase, they proclaim man's freedom and his boundless responsibility to grapple with real problems and alleviate somewhat the absurd and cruel illogic of man's fate. Along with Sartre, Bataille, Blanchot, and Merleau-Ponty are the most striking exponents of atheistic Existentialism. (3) The Christian tradition, probably the oldest and the deepest in French thought, is also active. A whole group of Existentialists, derived from Kierkegaard and from the Swiss Protestant Karl Barth, claim to resolve the absurdity of the world and the problem of evil through a reinterpretation of original sin. This Christian group of French writers has sided resolutely with the Left in political and social matters. They hope to change man as well as society, and cling to respect for the human person: "Personalist" is the label often affixed to them. Gabriel Marcel and Maritain are the philosophical mouthpieces of this Christian group; Mauriac and Bernanos, its novelists, Pierre Emmanuel, Cayrol, Luc Estang, its poets. Their reviews are *Temps Présent*, *Témoignage chrétien*, *Esprit*, *Etudes*, *La Vie intellectuelle*.

Thus variety and stimulating contrasts characterize French letters today; France has always been a land of dialogue; intellectual monotony remains the sin most devoutly to be avoided.

HENRI PEYRE.

**FRENCH NORTH AFRICA.** Consists of the northwest corner of Africa, except for certain small Spanish territories (see SPANISH AFRICA), and is known to

the Arabs as "el Moghreb"—"The West." Its territory is divided among Algeria (847,500 sq. mi.), French Morocco (153,870 sq. mi.) and Tunisia (48,300 sq. mi.).

**Government.** Northern Algeria is for most purposes treated as an integral part of France. It is divided into three departments (Oran, Algiers, Constantine) in which the French population has for many years elected representatives to the legislative bodies in Paris. The over-all authority is exercised by a Governor-General who is responsible to the Minister of the Interior in Paris. Natives have been represented only on local bodies such as the *Délégations Financières*. The number of Moslems who have enjoyed French political rights has been quite small, but has recently been greatly augmented (see *Events*). South of the three departments, in the Sahara, lie the four Territories of the South, which form a separate colony under military command.

The empire of Morocco is theoretically an absolute monarchy, but in reality it is a French Protectorate where power is exercised by the French Resident General, who is also the Minister of Foreign Affairs and is responsible to the Ministry of Foreign Affairs in Paris. Under the Resident General is an extensive administration, French in its higher levels but with increasing numbers of natives in the local areas. In some parts of the interior military, rather than civil, administration has been the general rule, since these areas have been "pacified" only recently. The capital of the French regime is at Rabat, though the Sultan occasionally resides in one of the other historic capitals—Fez, Marrakesh, and Meknes.

Tunisia, like Morocco, is a French Protectorate and thus under the direction of the Foreign Ministry in Paris. An hereditary Bey nominally rules over the Regency, but the actual administration is under the control of a French Resident General who is also the Minister of Foreign Affairs for Tunisia. He presides over a cabinet in which some of the departments are headed by Tunisians. Local affairs, both judicial and executive, are to a considerable extent under the administration of native officials. Extensive reforms have recently been proposed (see *Events*). The capital is at Tunis. There are no over-all representative institutions in either Morocco or Tunisia and, being Protectorates, their Moslem inhabitants are not represented in the legislative bodies of Paris.

**Events.** The agitation for independence in the "Moorish" countries received a fresh impetus from the newly organized Arab League in Cairo. Operating through the North African Defense Front, it openly espoused the cause of North African freedom. An annex to the pact constituting the Arab League had pledged the latter "to use its best efforts" in order that the political aspirations of the non-independent Arab peoples be realized and that meanwhile they be permitted to participate in the non-political activities of the League. The League's secretary-general, Abdul Rahman Azzam Pasha, made it quite clear that his organization wanted the League to include *all* Arabs everywhere. On November 17 he declared that "the Arab nations cannot cooperate with France or Spain as long as they occupy Arab nations in North Africa . . . We Arabs will not be satisfied until North Africa is liberated." Though the Defense Front had no great popular following, the French government did not make the mistake of underestimating the power of its appeal to the hungry and destitute masses in North Africa.

After several years of drought and consequent

famine, the food situation improved during 1946. Late in March ex-President Herbert Hoover, on a world tour to investigate food conditions, reported that "in French North Africa some fresh vegetables are beginning to be available but the volume is still small. Drought was most severe there. It is the only country so far visited, and perhaps the only country in all to be visited in which the farm population is no better, and perhaps worse off, than the urban population. Livestock losses were heavy, amounting to 80 percent in some localities." He found the normal consumption of bread to be 10.6 oz. per day; of fats, 17.7 oz. per month; and of sugar, 17.7 per month. These rations provided 1,000 calories a day, supplemented by 500 more calories from other sources. He estimated that French North Africa would require 250,000 tons of grain by June 15, when the new harvest would come in. However, the report continued, "French North Africa will have enough grain for its own needs in 1946-47 only if weather conditions from now [late March] until harvest are above average." Happily, the harvest was the best in years, though adverse weather conditions blighted it in certain districts, and North Africa was relieved of heavy dependence on grain imports.

**Tunisia.** The two Tunisian nationalist movements, the Destour [constitutional] and the Neo-Destour Parties, operating in fairly close conjunction, were the source of considerable trouble for the French authorities during the year. The leader of the latter group, Habib Bourguiba, voluntary exile in Egypt, was in close contact with the Arab League in Cairo. Late in the year he arrived in the United States, where he hoped to interest American public opinion in his campaign for Tunisian independence. His headquarters in Cairo had, a few weeks earlier, denied that naval bases in Tunisia had been offered to the United States in exchange for assistance in freeing the country from France. However, Bourguiba stated quite frankly that he hoped so to impress the outside world with the justice of his demands and the depth of his countrymen's desire for freedom that the other Powers would bring pressure on France to grant Tunisia her independence and thereby avert bloodshed.

The French authorities admitted that most Tunisians favored the nationalists' program, but they were unwilling to diminish the prestige and strategic position of France in the Mediterranean by according the Tunisians more than moderate reforms. These consisted in the creation of a Ministry of Social Affairs, the reconstitution of a Grand Council with consultative functions in regard to legislation, the restoration of the Tunis Municipal Council and of the regional councils, and the establishment of new councils in the rural areas. The Grand Council comprised two sections of equal size, one French and one Tunisian. The first was elected by universal adult suffrage among the 120,000 French citizens in the Regency, the second by a selected few males from among the 2,700,000 native population. In any case the Council was purely consultative, and was not authorized to discuss constitutional or political affairs. It could hardly, therefore, be regarded by the Tunisians as a very effective means for expressing their wants or for determining their own future.

At the same time, the French administration pointed out that it had embarked on a ten-year development plan costing 73,000,000,000 francs that was expected to increase the country's agricultural production two or threefold within two decades. The Nationalists rejoined that this money was

coming from the Tunisians themselves and could hardly be regarded as a favor conferred on them by France. In any case, they wanted to run their own country, and nothing short of that would satisfy them.

The Nationalists were especially concerned over the proposal to create a French Union comprising all of France's overseas possessions and protectorates. This would integrate Tunisia more closely with France and open the country to further French colonization. A hint of things to come had been given when French citizens in Tunisia had been permitted to vote in elections for the Assembly in Paris, at a time when political parties were prohibited to the Tunisians, their newspapers were suppressed, and they were forbidden to hold public meetings. (In the referendum on the first constitution submitted to all the French voters in Tunisia, 28,000 voted against it, 16,000 for it, and 35,000 abstained.)

Despite assurances by General Charles Mast, Resident-General in Tunis, that his regime was dedicated to liberal principles, a number of native leaders were arrested on August 23 while attending a secret congress of the independence movement. According to a dispatch from Cairo in the *New York Times* of September 3, "Three thousand persons, including former Ministers, Destourians, labor union members, civil servants, intellectuals, religious leaders, and professional men were said to have been attending the congress when French police entered, ordered the meeting dissolved and arrested fifty-two leaders, seven of whom were released. Armored cars surrounded the district and mobile guards with automatic weapons accompanied the police. . . . Among those arrested were Laroussi Haddad, president of the Criminal Court, who was presiding, all except one member of the political bureau of the new Destour; three leaders of the old Destour and Sheikh Fadel ben-Aschour, professor and labor union leader. Judge Haddad later was released. Before the meeting was broken up it adopted a resolution condemning the French 'regime of exploitation' since 1881 and declaring that 'immediate independence, complete and without conditions, is the only regime capable of rectifying the errors of the past and of safeguarding the destinies of a great people.'"

The Tunisian Labor Federation, with a membership of some 30,000 recently detached from the French *Confédération Générale du Travail*, went out on a three-day strike. During the crisis the French brought in reinforcements of Senegalese troops. Even the Bey, whose removal had been demanded by the Destour, showed his displeasure at the repressive measures of the French administration.

A month later, on September 25, General Mast announced reforms, which included the abolition of French regional chiefs, the extension of municipal elections to the entire country, the creation of a Cabinet Council under the Bey, and the establishment of a Grand Council to be chosen directly by an electoral college. The intention of these reforms was to have the French officials serve merely as "advisers" for the Tunisians and to give the latter increased responsibility for the administration of their own government.

**Algeria.** The political situation in Algeria differed from that of Tunisia in several respects. For one thing, Algeria had long formed a part of the French constitutional system, being organized into three departments represented in the Paris Chamber of Deputies and Senate. The prospect of being absorbed into the new French Union was not, there-

fore, so disturbing to Algerian public opinion as it might otherwise have been. This circumstance no doubt helped to explain why some of the Algerian delegates to the National Assembly supported the government's colonial policy—the same policy so bitterly opposed by the Tunisian Nationalists, for example.

The leader of the Democratic Union of the Algerian Manifesto, Ferhat Abbas, a druggist of Sétif, and most of his colleagues represented this tendency. Politically and culturally they looked to the institutions of the Christian West rather than to the Moslem East. They opposed Pan Islam as an "anachronism," favoring instead the "autonomy of Algeria in the framework of French federalism." By autonomy they meant an Algerian government responsible to an Algerian parliament voluntarily federated with the French Union. The moderation of these demands was all the more significant because Abbas had been released from prison only in March, after having been kept there since the disturbances in the Department of Constantine of May 1945 (see *YEAR BOOK* for 1945, p. 230), and because his party had been allowed to operate again only in the middle of May 1946 after having been suppressed and declared illegal for a year.

On the other hand, the Association of the *Ulemas* (Moslem learned men) opposed the assimilation of Algeria into France, either politically or culturally. Instead they favored a theocratic form of society and government, allied with the conservative elements running the Arab League in Cairo. Also in touch with Middle Eastern Arabs was the Algerian People's Party. The leader of this group, Messali Haj, was released from detention in French Equatorial Africa during the summer, but was later reported to be under house arrest in Paris, where he was agitating for complete independence.

For electoral purposes Algeria had been divided into two "colleges," each with thirteen seats in the Assembly in Paris. One college comprised some half million French men and women, including natives on whom French citizenship had been conferred for one reason or another. The other college contained 1,341,000 Moslem non-citizens. In the election of June 2, the latter college returned 11 members of the Manifesto Party, including Ferhat Abbas, and two Socialists who had stood on a platform favoring a single electoral college for all of Algeria. The French authorities were surprised at this turn of events, particularly since the Manifesto had never before participated in elections.

On September 25 the French cabinet made known the terms of a bill for the reform of the government of Algeria which it intended to present to the National Assembly. According to the *London Times* for September 26, this bill provided for "the displacement of the present financial assembly by an Algerian Assembly of 90 members, of whom half would be Muslims. Its members will be elected by universal suffrage for six years, with elections for half the members every three years. It will share with the governor general the initiative in financial matters, and will have some power of proposing new laws applicable to Algeria. M. Ferhat Abbas, leader of the Algerian autonomous party in the Constituent Assembly, has criticized these proposals as providing no means for loosening the stranglehold of the Algerian Civil Service [French] on the administration. It is clear that the Bill does not provide for self-government, since there is to be no form of Algerian Cabinet."

The economic situation in Algeria after three years of drought was anything but happy. Instead

of too little rain, some districts have actually received too much, and right during the late spring harvest season. Nevertheless, the grain situation had improved over previous years, when half or more of the wheat consumed had had to be imported. The tragic depletion of livestock, in some areas amounting to 95 percent, could not be remedied save after a number of years. Meanwhile those who depended on herding for their livelihood were crowding into towns and cities where they could be fed at government kitchens. The populace also suffered from a very grave clothing shortage that left countless thousands dressed in rags and tatters.

In mid-February a severe earthquake in the southwest corner of the Department of Constantine was reported to have resulted in some 300 deaths. Two separate areas were hit by the tremors, one near Sétif and the other around Batna.

**French Morocco.** Morocco appeared to be politically the quietest part of French North Africa. In May the leaders of the *Istiqlal*, or independence, Party were released, along with the heads of the anti-French groups in Algeria and Tunisia, though their party was not legalized. Late in the summer representatives of the *Istiqlal* movement went to Paris in order to lay their case before the French government. The objectives of their party, they declared, were the establishment of a constitutional monarchy with an elective parliament. They also asserted that they enjoyed the support of the sultan.

The Pan Arab movement of the Middle East did not appear to hold as much interest for the Moroccans as for peoples like the Tunisians who were nearer to Cairo. The Arab League, however, included Morocco among those countries which it intended should eventually become free and hence able to join it. In the Spanish Zone of Morocco the independence movement sponsored by the Franco regime continued, as was intended by Madrid, to be a source of trouble for the authorities in the French Zone. What effect the rise in importance of the Communist Party in France would have on colonial policy remained to be seen. Some observers believed that the Communists would prefer to keep the empire intact, against the day when they would inherit it; while others pointed out that a strict adherence to Marxist principles would dictate that the Communists follow an anti-imperialist line.

The much improved economic situation of Morocco contributed to political stability. By June the new harvest was coming in and, because it was nearly normal in volume, no further grain had to be imported from America.

The once important United States Army air base at Cazes, near Casablanca, had by the end of the year become almost unused. Instead, both the Army and Navy were operating from the American base at Port Lyautey, north of Rabat. Reports were current in the fall that the Navy wanted to keep this base permanently and that the subject was under negotiation with the French government. (See SPANISH AFRICA; TANGIER.)

**The Population.** The population of Algeria in 1936 numbered 7,234,684, of which nearly one million were European. Only a tenth of Algeria's inhabitants live in the vast desertic Territories of the South. Arabic is the predominant language spoken by the Moslems, with Berber dialects found in certain districts. There are also Jewish communities in the cities. The education of the natives is provided largely by Moslem schools, which are attended by only a small part of the population. For

the Europeans there is the regular French scholastic hierarchy, culminating in the University at Algiers.

In 1936 the population of the French Zone in Morocco was 6,298,528, of which 5,874,888 were native Moslems, 161,312 native Jews, 173,533 French, 59,058 other Europeans. (All these figures have probably undergone considerable change during the last decade.) The native population consists largely of Moslemized Berbers and the descendants of the Arab invaders of the early medieval period. There has also been a considerable intermixture of Negro blood imported across the Sahara. Under French rule the major cities of Morocco have grown rapidly, until today Casablanca has a half million inhabitants, while Rabat, Fez, Marrakesh, and Meknes all exceed 100,000. Berber is still used by a considerable portion of the natives, especially in the interior. Along the coast, however, Arabic has become the common tongue. In general the educational facilities available for the Moslems are limited and outside the populated centers are provided mostly in religious schools. There is, however, the noted Kairouan University at Fez. For the European population there are a number of primary and secondary schools. At Rabat there is also the Institut des Hautes Etudes Marocaines.

In 1936 the population of Tunisia was 2,395,623 Moslems, 59,485 Jews and 213,205 Europeans. Included in the latter figure were 108,068 French and 94,289 Italians. However, these figures are deceptive since a great many of those counted as French are of Italian ancestry. The Moslems are largely Arabic-speaking, the principal exceptions being found among certain tribes in the south. The European population is almost entirely Roman Catholic. Education is provided partly by religious and other private funds, and partly by the Government. As elsewhere in North Africa, the European population is much better educated than the mass of the natives.

**The Country's Economy.** In all three countries agriculture is the principal occupation of the natives. The chief crops are wheat, barley, oats and other cereals. Tobacco is raised extensively in Algeria. Olive oil is produced in large quantities, notably in Tunisia, where in the south large tracts are covered with cultivated olive groves. Cork and almonds are produced in Morocco, while citrus and other fruits are widely grown in the warmer zones of all three countries. Wine is an important product in Algeria and Tunisia. Sheep, goats and cattle are raised in large quantities throughout French North Africa. Fisheries are found along the coasts and provide food both for local consumption and for export.

Algeria produces important amounts of iron ore (2,325,500 metric tons in 1937), phosphate rock (566,571 metric tons in 1937), lead and zinc. Morocco's leading mineral product is phosphate (1,447,327 tons in 1938), while zinc, lead, iron ore and manganese are also extensively mined. Phosphate rock is also the principal export mineral of Tunisia (1,608,045 metric tons in 1939), with iron ore coming second (764,731 metric tons).

By and large the manufacturing industries of French North Africa are still in a rudimentary stage—a fact which greatly handicapped the use of that region as a base for the Allied invasion of southern Europe in 1943. Present plans call for an acceleration of the process of industrialization.

Figures for foreign trade have not been available for a number of years, but those for the pre-war years reveal that by far the lion's share went

to France. Internal communications are provided by a railroad network that extends all the way from the Gulf of Gabes to Marrakesh. Altogether there are over 5,000 miles of railroad, supplemented by several thousand miles of improved highways. Modern ports exist at such places as Casablanca, Oran, Algiers, Philippeville, Bône, Tunis, Sousse, and Sfax. There are naval bases at Mers-el-Kebir and Bizerte.

ROBERT GALE WOOLBERT.

**FRENCH OCEANIA.** The French possessions in the eastern Pacific, comprising several groups of islands. The principal groups are: Society, Marquesas, Tuamotu, Leeward (Îles sous le Vent), Gambier, Austral, and Rapa Islands. Clipperton, an island 670 miles southwest of Mexico has been included in French Oceania. Tahiti (600 sq. mi.; pop. 19,029 in 1936), of the Society group, is the main island. Total area, 1,520 square miles. Total population (November 1, 1941), 51,221. Capital: Papeete (on Tahiti), 11,614 inhabitants in 1941. Chief products: copra, vanilla beans, phosphate, and mother-of-pearl are the chief products. Foreign trade (1943): imports 97,223,000 francs; exports 142,645,000 francs. The budget (1944) was balanced at 43,449,000 francs. The Government is under the control of a Governor, assisted by a private council and an assembly of financial and economic delegations. Governor, Colonel Orselli.

**FRENCH SOMALILAND.** This is the smallest of the four parts of Somaliland: 9,071 sq. mi. Its importance is due to its location near the southern end of the Red Sea, where it functions as a French counterpart to Aden. The capital, Jibuti, also serves as the maritime terminus of the railroad to Addis Ababa, through which is channeled much of the foreign trade of the Ethiopian highland. This transit trade was valued at 393,000,000 francs in 1944. In 1944 steam merchant vessels numbering 1,391 stopped at Jibuti. Otherwise the colony has little importance, salt being the only product of value (42,645 metric tons were exported in 1944). The census of 1944 disclosed a population of over 40,000, divided as follows: 14,056 Somali, 3,392 Arabs, 21,546 Danakil, and less than a thousand Europeans. The population of Jibuti in 1944 was 10,421. French Somaliland is administered by a Governor, with the assistance of an Administrative Council.

The principal *raison d'être* of Jibuti, the capital of French Somaliland, has been to provide an ocean gateway for the foreign trade of central Ethiopia. Much of this trade normally has passed, since World War I, over the Addis-Ababa-Jibuti railroad, operated by a French company. During World War II the equipment and roadbed of this line had deteriorated sadly, thus injuring both Ethiopia and Jibuti. In order to facilitate the rejuvenation of the railway, the French and Ethiopian governments entered agreements by which its administration was returned to the Franco-Ethiopian Company and an arbitral tribunal was set up to settle disputes over the terms of the concessions (see ETHIOPIA).

Early in the year work was commenced on a large and modern airport near Jibuti, capable of serving large planes operating on lines to the Orient and East Africa. On June 6 a weekly air service was opened between Jibuti and Addis Ababa by the Ethiopian Air Lines, a company controlled by the Ethiopian government but operated by the American T.W.A. firm.

ROBERT GALE WOOLBERT.

**FRENCH WEST AFRICA.** A vast territory comprising the administrative divisions indicated in the following table:

Colony	Sq. mi.	Pop. (1945)	Capital
Dahomey . . . . .	43,232	1,436,000	Porto-Novo
Dakar* . . . . .	60	182,000	Dakar
French Guinea . . . . .	96,886	2,164,000	Conakry
French Sudan . . . . .	590,966	3,875,000	Bamako
Ivory Coast . . . . .	184,174	4,124,000	Abidjan
Mauritania . . . . .	323,310	377,000	— <sup>b</sup>
Niger . . . . .	499,410	2,058,000	Niamey
Senegal . . . . .	77,730	1,727,000	St. Louis
French West Africa	1,815,768	15,943,000	Dakar

\* Including dependencies. <sup>b</sup> The lieutenant governor of Mauritania resides in St. Louis, Senegal.

Togo, a narrow mandated territory lying between Dahomey and the Gold Coast with an area of 21,893 sq. mi., included under this heading, though administratively it is separate from French West Africa.

**Population.** Out of the 16,000,000 inhabitants only some 37,000 are Europeans. The natives are largely Sudanese Negroes, but with strong Hamitic influences in many areas of the Sudan and in the Sahara. These elements are the results of migrations from North Africa and the Nile Valley, which also introduced the Mohammedanism professed by many of the inhabitants in the drier parts of French West Africa. The southern zone, lying in the belt of tropical rain forests, is largely pagan except where Christian missions have made converts.

Elementary schools are small in number and are provided partly by the government and partly by missionaries. In 1946 the education budget was 106,000,000 francs. The natives are encouraged to learn French, which is useful for obtaining employment in the government service or in European-owned enterprises. By and large the French authorities appear less concerned to preserve the native's culture and tribal institutions than are the British in their West African colonies. The William Ponty Normal School at Dakar provides training for various professions. In the same city is the French Black Africa Institute for the study of African culture and languages.

**The Country and Its Economy.** The climate, which is hot and wet on the Guinea coast, becomes progressively drier to the north. In terms of vegetation this means that the coastal forest shades off into the open savannas of the Sudan and finally into the world's greatest desert—the Sahara. Occupations are conditioned by these climatic circumstances. In the south the important products are cocoa, coffee, palm oil and kernels, tropical fruits and rubber. In the drier regions they are cotton, cereals, peanuts, cattle, sheep and goats, and hides and skins. Figures illustrating the volume of exports are (for 1944) peanuts, 116,551 tons; cocoa, 14,674 tons; palm kernels, 50,082 tons; coffee, 24,455 tons. Interesting native industries are to be found in Dahomey and Togo, and to a lesser extent in some of the other colonies.

There are over 2,700 miles of railway and many thousands of miles of usable roads; a considerable section of the middle Niger River is navigable by shallow-draft vessels. The principal ports are Dakar, Conakry, Abidjan-Port Bouet and Cotonu. In 1944 the total value of imports was 2,077,100,000 francs, and of exports 1,726,175,000 francs.

**Government.** For French West Africa as a whole there is a Governor-General, assisted by a Council. Each colony, including the Circumscription of Dakar et Dependences, has in addition its own Governor. The Governor-General supervises the administration of these governors, but leaves to

them the details of local government. There is a general budget covering certain matters of common interest to all of French West Africa; but there are also separate budgets for each of the colonies. The financial estimates for 1946 showed a budget balanced at 6,156,727,000 francs. Senegal, being one of the older French colonies, has been represented in the Parliament at Paris by an elected deputy.

Very few of the native are French citizens (except in and around Dakar) possessing the political rights associated with that status. However, the proposals of the French Provisional Government for a federal union between France and her colonies provide for a greater equalization of political status among all the inhabitants of the French empire. The capital is at Dakar. Togo is a Class B Mandate; its capital is Lomé.

**Events.** The year opened in Senegal with a serious strike by the workers of Dakar, which soon spread to other cities such as St. Louis. The situation became so grave that the Minister of Colonies felt obliged to fly down from Paris and investigate on the spot. One of the chief complaints of the strikers had to do with inequalities of pay. General economic conditions also contributed to the prevailing unrest. Goods were scarce and prices were high. Many of the shortages of manufactured articles continued despite the return of peace, due to exchange difficulties and lack of shipping.

The plan for developing the vegetable oil production, mentioned above under FRENCH EQUATORIAL AFRICA, applied with especial pertinence to West Africa, where the principal export is peanuts grown for their oil content. According to this scheme, the vegetable oil output of French West Africa was to be increased until it reached 250,000 metric tons a year. New methods of cultivation were to be introduced by the government and the natives encouraged to adopt them.

During the year an interesting trend in the field of religion was noted and widely commented on—the constant advance of Islam in West Africa. According to the best available statistics, one-half the population of French West Africa is Moslem, with the proportion of non-Moslems steadily diminishing. Various reasons for this phenomenon were advanced, the most obvious one being the simplicity of Islamic doctrine and the ease with which it could be embraced by unsophisticated people. In contrast, it was pointed out, the complexities and inter-denominational divergencies (and antagonisms) of the various Christian sects only confused the native mind.

**French Togoland.** An account of France's policy in her African-mandated territories will be found in the section on the French Cameroun under FRENCH EQUATORIAL AFRICA. In Togoland the local chiefs opposed the continued separation of the country into British and French zones, and some of them sent telegrams to the United Nations seeking redress. The Ewes in particular complained that the artificial frontier interfered seriously with their freedom of movement and the natural development of their economy.

ROBERT GALE WOOLBERT.

**FRIENDS, Society of (Quakers).** A religious society founded in England by George Fox (1624-90) which stresses the direct guidance of God through revelation to the individual, sometimes called the Inner Light, and as a consequence practices group silent waiting for a realization of the presence of God instead of outward sacraments, repudiates war, holds all human life sacred, and seeks to serve

mankind through its American Friends Service Committee. There are a number of branches of Friends among which are: the Conservative Friends; the General Conference of Friends (Hick-site); the Philadelphia Yearly Meeting (Orthodox); and the largest one, The Five Years Meeting of Friends (Orthodox), with headquarters in Richmond, Indiana.

**GAMBIA.** A British colony and protectorate in West Africa, occupying each bank of the Gambia River for a distance of 300 miles from the coast. Area, 4,068 square miles. Population (1940 estimate), 205,000. Capital, Bathurst, on the Island of St. Mary (69 square miles). With the exception of the Island of St. Mary the colony is administered as a protectorate under a governor, assisted by an executive council and a nominated executive council. The appointment of Andrew B. Wright as Governor and Commander in Chief was announced on November 21, 1946. The country exports groundnuts, palm kernels, beeswax, and hides and skins, and produces a variety of crops for domestic consumption. Clothing, agricultural and domestic implements, and a variety of consumer goods are imported. The chief source of revenue is customs.

**GENERAL ACCOUNTING OFFICE.** An agency of the U.S. Government, created independently of the other agencies, to secure the uniform settlement and adjustment of all claims and accounts in which the United States is concerned. Comptroller General of the United States in 1946: Lindsay C. Warren.

**GENERAL EDUCATION BOARD, The.** An institution incorporated by an act of Congress in 1903, with the stated object of promoting education within the United States of America without distinction of race, sex, or creed. The present program of the Board is restricted almost entirely to the support of educational work in the southern states.

The Board is empowered to spend the income and the principal of its funds. From the time of its establishment until December 31, 1945, its expenditures totaled \$277,075,776.35. As of December 31, 1945, its unappropriated assets amounted to \$16,717,886.06.

In 1946 grants were made to the following institutions toward endowment: University of the South, Sewanee, Tennessee, and Washington and Lee University, Lexington, Virginia (\$500,000 each); Southern Methodist University, Dallas, Texas, and Hendrix College, Conway, Arkansas (\$200,000 each); Millsaps College, Jackson, Mississippi (\$100,000); Virginia Union University, Richmond (\$75,000); Randolph-Macon Woman's College, Lynchburg, Virginia, and Bennet College, Greensboro, North Carolina (\$50,000 each). To Hampden-Sydney College a grant of \$200,000 was made toward endowment and the construction of a library building.

Appropriations for library development were made to Shaw University, Raleigh, North Carolina (\$40,000); the State Agricultural and Mechanical Institute, Normal, Alabama (\$32,500); Converse College and Wofford College, Spartanburg, South Carolina (\$30,000 each); the State Agricultural and Mechanical College, Orangeburg, South Carolina (\$23,300); and Phillips University, Enid, Oklahoma (\$20,000). The Alabama State Board of Education received \$75,000 toward the cost of constructing and equipping a library building at the State Teachers College.

Other appropriations included \$54,700 to the

University of North Carolina toward support of a department of nutrition in the School of Public Health; \$23,000 to the Mississippi State Department of Education toward the support of the Coordinated School Health and Nutrition Service, and \$12,000 for training courses in connection with this Service; \$18,000 to the University of Tennessee for scholarships in nutrition; \$13,500 to the North Carolina State Department of Public Instruction, and \$12,250 to the University of North Carolina for their research-use education programs; \$20,000 to Duke University for research and consultation on the marketing of forest products; \$15,000 to the University of Alabama for study of the iron and steel industry of the Southwest; \$12,000 to the University of North Carolina for a survey of coastal fisheries and related industries; \$25,000 to the United Negro College Fund, Inc., toward a fund for maintenance of privately supported institutions for Negroes; \$23,400 to Mississippi State College toward research in farm management, and \$20,000 to this institution for the support of a research worker at Alcorn Agricultural and Mechanical College to cooperate in studies of the economic, educational, and health conditions of Negroes.

President of the General Education Board: Raymond B. Fosdick. Secretary: William W. Brierley. Offices: 49 West 49th Street, New York 20, New York.

**GENERAL LAND OFFICE.** An Office of the U.S. Department of the Interior which supervised the survey, management, and disposition of the public lands and the minerals therein. Consolidated with Grazing Service to form the Bureau of Land Management, July 16, 1946.

**GEOGRAPHICAL NAMES, United States Board on.** A branch of the United States Department of the Interior, successor to the United States Geographic Board, which is the official authority on the use of geographic names by the Government. Director: Meredith F. Burrill.

**GEOLOGICAL SURVEY.** The year 1946 was in many ways a year of transition, and the activities of the Geological Survey were of necessity divided. A large proportion of the work consisted of the preparation of reports on the varied projects carried on during the war. As the year progressed, however, an increasing amount of attention was given to the Survey's normal function of long-range geologic research and mapping.

**Funds.** During the fiscal year 1946 there was available for expenditure under the direction of the Geological Survey a total of \$15,209,654. Of this amount \$7,416,860 was appropriated directly to the Geological Survey, and \$7,792,794 was made available by other Federal agencies, and by States and their political subdivisions.

**Geologic Branch. Metals and Non-metallic Minerals.** In the study of metals, 45 major projects were carried on, of which 14 were completed during the year. About two-thirds of these investigations were of deposits of the base metals—copper, lead, zinc, and iron—with particular attention paid to lead and zinc. Because of the great depletion of our reserves of the base metals during the war, plans for the future call for continued extensive exploration. The major projects were carried out in 18 states, in 7 of which part or all of the work was done in cooperation with State agencies. Three major projects were carried out in the Missouri River Basin as a part of the development program of the Department of the Interior.

In the field of non-metallic minerals, fluor spar investigations were continued in 7 States. Field investigations of pegmatite deposits containing mica, lithium minerals, tantalum, beryllium, and feldspar were curtailed, but reports on the deposits of 6 States have been completed, and reports on other States are nearing completion. Deposits of high-alumina clays were studied in a number of States, and reports on the investigations are being prepared. Field surveys designed to aid the search for new deposits of talc and potash were continued, and maps showing the location of non-metallic mineral resources and construction materials in the Missouri River Basin were prepared and published.

**Fuels.** Continuing its program of regional geologic studies to aid the intensified search for new supplies of oil and gas, the Geological Survey conducted investigations in 20 States. The work was directed primarily to the accumulation and interpretation of fundamental geologic data necessary to delineate new areas in which the geologic structure is favorable for the occurrence of oil and gas. Thirty-four reports, covering these oil and gas studies were printed by the Geological Survey, and more than 23,000 copies were distributed.

To appraise the potentialities and reserves of substitutes for liquid petroleum the Geological Survey, in cooperation with the Navy Department and the Bureau of Mines, completed during 1946 a study of the oil-shale deposits in Naval Oil Shale Reserves Nos. 1 and 3 in western Colorado. The results of this work showed much larger resources of shale oil than had originally been anticipated and served to emphasize the need for additional work of a similar nature in large, essentially unsurveyed areas of oil shale in the Rocky Mountains and other regions.

The search for new supplies of coking and special purpose coals was continued during the year, in Colorado, Washington, Alabama, Georgia, and Maryland, largely in cooperation with the Bureau of Mines.

**Areal Geology.** Extensive and systematic geologic surveys planned for the postwar years were begun during 1946. These surveys are to provide geologic maps containing basic data needed by soil scientists and engineers, as well as in the search for hidden deposits of minerals. During 1946, 13 quadrangle geologic maps covering approximately 1,650 square miles in the States of Massachusetts, Montana, North Dakota, Rhode Island, and Wyoming were completed. Mapping was under way in 28 additional quadrangles in these States and in New Mexico and Texas. Work on a small-scale geologic map of the State of South Dakota was completed, and work on a similar map of Montana continued.

Special projects carried out in 1946 included a study of shore-line changes in Massachusetts, where much property was damaged during the great storms of 1944-45, and a study of the occurrence of selenium in bedrock in South Dakota to delineate belts wherein plants concentrate amounts of selenium that are poisonous to grazing stock.

**Engineering Geology.** Engineering geologists within the Geologic Branch are devoting their efforts to the collection, interpretation, and dissemination of geologic data for the use of engineers. This group has its headquarters in Denver, Colorado, where they work in close cooperation with the engineers of the Bureau of Reclamation. During 1946 they prepared preliminary maps showing deposits of sand and gravel and other construction materials in six States and made detailed engineering geologic studies of four quadrangles in North Dakota. Other

projects that were begun during the year and will be continued in 1947 include studies of reservoir sites, landslides, mine waters, and various kinds of subsurface data of interest to construction engineers.

**Basic Research.** Specialized groups of scientists in the Geological Survey spent most of their time during the war in furthering the work of the economic geologists on projects directly concerned with the search for needed war materials. In this group are chemists, physicists, petrologists, and paleontologists. In increasing numbers they are now being returned to their normal pursuits. The chemists and physicists are conducting basic research on analytical methods and determinations of radioactivity, on spectrographic procedures and X-ray techniques. The petrologists are expanding their studies of many minerals, particularly clay minerals and related substances that eventually may become valuable sources of aluminum. The paleontologists, while continuing to support the work of the economic geologists by furnishing data derived from the study of fossil collections, are resuming general studies of fossil faunas and floras that were interrupted by the war.

During 1946, airborne magnetometer surveys covering about 70,000 square miles were made by the Geological Survey in cooperation with the Office of Naval Petroleum and Oil Shale Reserves. These and other surveys were made over potential oil-producing areas in northern Alaska, Wyoming, New Mexico, and the coast of the Gulf of Mexico, and over magnetic iron regions in the Adirondacks. The instrument has been modified and field methods have been improved so that large areas can now be surveyed more rapidly and more accurately than by ground magnetic methods—the airborne method is 50 to 500 times faster and provides more detailed data.

The evaluation of domestic resources of fissionable materials needed in atomic research has entailed field work in 32 States and has disclosed much new and valuable information. Reconnaissance investigations of state-wide areas have successfully delimited local areas in which detailed study was warranted, and research on the geophysical and geochemical properties of these materials, conducted both in the field and in the laboratory, has resulted in a further refinement of the techniques of exploration and detection.

**Military Geology.** The Military Geology unit in 1946 prepared 12 comprehensive intelligence reports for the Corps of Engineers. These reports concerned terrain, water supply, construction materials, mineral resources, and correlation of mine-detector performance with soil and rock characteristics. A special terrain intelligence folio on the Fort Knox Reservation, Kentucky, was prepared at the request of the Armored Forces and will be used for training purposes. A manual of military geology, requested by the Engineer Board, Fort Belvoir, for use in officer training was virtually completed at the end of the fiscal year.

Beginning in October 1945 a large group of geologists was assigned to Natural Resources Section, General Headquarters, Supreme Command Allied Powers, in Tokyo, forming the main part of the Mining and Geology Division. They made studies of Japan's mineral resources, metallurgical plants and processes, coal, construction materials, and water resources. Many short reports were prepared, and by the end of the fiscal year 25 special reports were virtually completed. Similar work was done in Korea.

Field work was begun on a geologic map of

Okinawa. This work is expected to be completed in the coming year, when similar studies will be undertaken in Palau, Guam, Yap, and Saipan.

Detailed geologic studies of Bikini Atoll were made prior to the atomic bomb tests. These surveys were repeated after the bombing to determine the effects of the explosions on the islands, the reefs, and the floor of the lagoon.

Two geologists assigned to the General Engineer District, Manila, are engaged in making surveys of construction materials to aid in the rebuilding of Manila. They are also cooperating with the Philippine Bureau of Mines in a program designed to develop the valuable mineral deposits of the islands.

**Work in Other American Republics.** In Mexico, Cuba, Brazil, and Peru, 14 mineral commodities were studied cooperatively under the auspices of the State Department. Geologic investigations were carried on in the vicinity of Mexico's new volcano, Parícutin; a geologic map of the area was completed, and a new topographic map, based on recent air photographs, is being compiled.

In Chile a reconnaissance of the mineral deposits of the Southern Archipelago was begun, and ground-water studies were undertaken in the central and northern parts of the country. These investigations, which were requested and financed by the Chilean government, will be continued into 1947.

Some of the tin deposits of Bolivia and the manganese deposits of Cuba were investigated with funds furnished by the Foreign Economic Administration.

Four training grants were awarded to Latin-American students of geology. Two of these were given to Mexicans and two to Peruvians, the funds being supplied by the State Department.

**Alaskan Branch.** The work of the United States Geological Survey in Alaska is directed primarily toward aiding in the development of the mineral resources of the Territory. This has involved field investigations in the course of which the known productive camps have been examined and about 300,000 square miles, or approximately half of Alaska, has been mapped topographically and geologically on reconnaissance standards. Many of the activities carried on during the war years and continuing through the 1946 field season have been relatively detailed examinations of specific areas or deposits, the results of which have been made available to appropriate war agencies, largely in the form of preliminary reports and maps. The distribution of some of these publications is still restricted because of War Department regulations, but they are being released to the public as rapidly as possible.

The war years have seen a greatly increased public interest in Alaska, which is already beginning to express itself in long-awaited postwar ventures on the part of both private interests and Territorial management. The objectives of the Alaskan Branch in its expanded postwar program reflect this interest. The investigations by the technical personnel engaged in field studies during the field seasons, which are short because of the unusual climatic conditions, has resulted in the issuance of a series of reports covering detailed examinations of a large number of mineral deposits, some whose worth was previously undetermined, others whose very existence was uncertain. Though few of these deposits have as yet reached the stage of commercial development, many stand available as sources of added raw materials to replenish the stockpiles that dwindled during the war. As a result of these relatively limited studies the known reserves of

Below: *Henry V*, technicolor film, produced and directed by Laurence Olivier, starring Laurence Olivier, presented by Theatre Guild Incorporated.

many of the economically important minerals in Alaska have been substantially increased. For example, quicksilver, formerly considered a resource of only minor significance, has become one of the important commodities now commercially produced in Alaska. The exploration by Alaskan Branch geologists have revealed additional coal reserves estimated at millions of tons.

The mining of gold has been Alaska's major industry. Gold produced prior to 1940 amounted to more than \$800,000,000. The year of lowest mineral production was 1927. Since that time, owing in part to the increase in price of gold from \$20.67 per ounce to \$35.00 per ounce and in part to improved mining methods, the quantity of gold produced has increased more than 260 percent and its dollar value has increased more than 430 percent. Although seriously curtailed during the war, gold mining has recovered somewhat since the cessation of hostilities and the recovery is expected to continue.

As by-products of the production of gold, silver worth more than \$14,000,000 and lead worth nearly \$3,000,000 have been produced. The increase in the amount of silver has been in proportion to the total quantity of gold produced, because all crude gold contains a few percent of silver. The amount of lead has varied in proportion to the amount of gold taken from lode mines, because lead is a by-product of lode-gold mining.

During the 1946 field season there were 31 Geological Survey projects in progress in Alaska. They included both reconnaissance and detailed studies, of immediate and long range scope. In brief, they were directed toward the following objectives: systematic study of the Juneau gold belt; appraisal of the gold and quicksilver resources of the Kuskokwim area; the geology and mineral resources of northern Chichagof Island and the Blashe Islands; a systematic start on investigation of the non-metallic mineral resources of Alaska; five field projects and associated activities connected with investigation of the petroleum possibilities of extreme northern Alaska; two similar projects covering petroleum possibilities in southern Alaska; three separate investigations of Alaska coal resources; three coordinated studies of permafrost (permanently frozen ground) phenomena; four related projects dealing with the geologic history and volcanology of the Aleutian Islands and Alaska Peninsula; four field topographic mapping projects, in addition to the preparation in the United States of maps covering thousands of square miles of Alaska terrain, by photogrammetric methods, utilizing air photographs; and the initiation of a long range investigation of surface and underground water resources of Alaska.

The efforts of the Alaskan Branch, never numbering more than the 53 geologists at its present peak and through most of the half century of its life only between 5 and 10, have been widely spread over most of Alaska's nearly 600,000 square miles of country and have resulted in the accumulation of a considerable body of sound and lasting information; but the task ahead is tremendous.

Activities of the Alaskan Branch were transferred in 1946 to the appropriate functional branches so that proper coordination and integration of all Alaskan activities will now be attained through a Staff Geologist for Territories and Island Possessions attached to the Director's office. This reorganization within the Geological Survey was decided upon after long study of the many problems arising out of the great increases in Alaskan activities and Geological Survey responsibilities.

**Topographic Branch.** Topographic maps are fundamentally essential to a survey of the country's resources and are highly valuable for the economical and efficient planning of drainage, flood control, irrigation, water supply, hydro-electric, and transportation projects; they minimize the number of expensive field surveys needed in connection with the location of transmission lines, railways, highways, canals, tunnels, airports, and industrial plants and thereby reduce the cost of construction; they provide topographic data essential to the proper location of frequency-modulated and television radio stations; and they are essential for recording and correlating data obtained from geologic investigations, thus aiding immeasurably in the location, evaluation, and development of our mineral wealth. Maps of this kind provide information necessary for the proper classification and best utilization of the public lands, the conservation of the soil, and the administration and protection of the forests, both State and National.

Topographic mapping in the United States has proceeded at such a slow pace that only a relatively small part of the country may be considered sufficiently well mapped to meet present-day requirements. Half of the nation is without topographic maps; of the maps available to the other half, some are considered adequate for present-day requirements, but others are too obsolete to meet the varied needs. In the vast domain of public lands, enormous areas have never been mapped; consequently the administrative officials responsible for enforcement of the public land laws are without detailed knowledge of their extent, the character of the terrain, their intrinsic value, or the possibility of their development.

Recognizing the urgent need for topographic maps, the Geological Survey is preparing a report reviewing the status of mapping. A program of sufficient scope to provide adequate maps for the entire Nation within a period of 20 years is being submitted, with recommendations for the enactment of legislation that will make this program effective. The entire 20-year program has been evaluated in its relation to the needs of all Government agencies in order to avoid duplication of effort, to assure uniformity in mapping, to utilize the most efficient modern methods, and to provide the essential maps when and where needed.

Work on the International Map of the World on a scale of 1:1,000,000 was continued by the Section of Cartography. Six sheets were in progress—Austin (H-14), Mississippi Delta (H-15), Los Angeles (I-11), Savannah (I-17), Mt. Shasta (K-10), Lake Erie (K-17), and Cascade Range (L-10). At the end of the year two sheets were in course of publication—Hatteras (I-18) and Chicago (K-16).

Preparation of the transportation map for the Public Roads Administration was continued. Compiling, inking, lettering, and editing was in progress for the States of Louisiana, Nevada, Ohio, West Virginia, Alabama, and Indiana. Eight sheets in Virginia and the sheet for Washington and vicinity were transmitted for publication; 10 of the 33 sheets in Texas were published.

A complete revision of State base maps on a scale of 1:500,000 was started during the fiscal year. Compiling, inking, and lettering is in progress on maps for the States of Wyoming, New Jersey, Massachusetts, Rhode Island, Connecticut, and Delaware.

The Columbia River Basin map was completed and printed.

During the year 166 quadrangle maps were edited for publication, of which 137 were for multi-

color photolithography and 29 for engraving; 150 quadrangle maps, 19 State maps, and 14 State index maps were prepared and edited for reprint editions; 100 maps and diagrams that had been prepared as illustrations for geologic reports were edited; and 345 proofs of all kinds were read. On June 30 maps in the process of reproduction included 54 for engraving and 72 for multicolor photolithography; maps being edited or awaiting editing included 29 maps for engraving and 17 for multicolor photolithography; and 256 maps remained on hand for preparation for reprinting.

The principal work of the Section of Photomapping is the production of topographic maps from aerial photographs by stereophotogrammetric methods and the production of planimetric maps and planimetric bases for topographic field surveys by both stereophotogrammetric and graphic methods.

Topographic maps of areas in the United States produced during the year by these methods covered approximately 9,396 square miles; planimetric and base maps covered an area of approximately 10,630 square miles. Topographic maps of foreign areas for the War Department, produced in manuscript form from aerial photographs, covered an area of approximately 9,522 square miles. In addition, Geological Survey personnel, working in cooperation with the Tennessee Valley Authority, either completed or supervised additional foreign mapping for the War Department in the amount of 2,482 square miles.

The Washington office maintains a general file of aerial photographs utilized in the work of the Geological Survey and of aerial photographic negatives that have been purchased under photographic contracts. Through this office contacts are maintained with other Governmental agencies involved in aerial photographic work.

**Map Information Office.** During the fiscal year a great expansion of the activities and facilities of the Map Information office was begun. During the years this office was relatively dormant because of necessary restriction upon the dissemination of map information and other terrain data. Since the close of the war a greatly increasing volume of requests for map information has been evident, not only from our own map producing units but from other agencies and from the general public. It has therefore become necessary to completely reorganize previous facilities for the dissemination of map information and considerably broaden the scope of service heretofore available. Several specialized units have been developed within the new Map Information Office for this purpose, namely: Topographic Maps; Aerial Photography; Map Control; General and Foreign Maps; and a service facility for the preparation of reports, exhibits, and index and progress maps.

During the six months that the Map Information Office has been functioning with additional personnel the number of visitors and the volume of inquiries, both by letter and telephone, have greatly increased, thus reflecting the attitude of the public to the advantages of such a service.

**Water Resources Branch.** The need for information on our water resources is evidenced by the steadily increasing number of requests from Federal, State, county, and municipal authorities in all parts of the country for investigations of the availability and chemical quality of water. This information is essential to successful planning and construction of projects related to many purposes, including irrigation, inland navigation, power production, industrial installations, municipal supplies, and flood

control, which involve the storage, control, or use of water, and therefore require continuous and up-to-date records concerning its fluctuations in quantity and quality, and its availability and utility. The needs arise from greatly increased use of water from shifting of population, as a result of establishment of new industries in areas that were previously rural or thinly settled; from the expansion of existing industries; and from our needs for increased production of power and agricultural products. Programs of water investigations are accordingly being expanded in all sections of the country.

Normal growth in the use of water has been accelerated and the need for information concerning it intensified by new basin-development projects, patterned in concept, but apparently not in organization, somewhat after the Tennessee Valley Authority. The Missouri River Basin is now being developed for flood control, irrigation, navigation, and water power. Similar development programs for other basins, such as those of the Arkansas and Columbia Rivers, are expected to follow. Such projects rest primarily on the availability and use of water. They require, therefore, much more comprehensive investigations of the water resources of those basins than have heretofore been considered urgent.

Major development and reconversion projects involve the use of water in large quantities. Reliable information concerning the available supply must be obtainable before such projects can be safely planned and satisfactorily executed. Water investigations by the Geological Survey precede and must be closely coordinated with the programs and projects of constructing and operating agencies. Realization of the need for coordination is demonstrated not only in connection with the trend toward basin development but also by the cooperative grants made by States and municipalities, which in 1946 aggregated more than \$1,600,000, and by other Federal agencies, which provided to the Survey more than \$1,300,000 for special water investigations made at their request.

The Survey's investigations of water have always been made chiefly from field offices, and the decentralization has become even more marked in recent years; in 1946 the work was conducted from more than 100 field offices, with one or more such offices in every State and in the Territory of Hawaii. This decentralization has resulted in a high degree of efficiency and economy of work and in better service to the public. Through the field offices close contacts are maintained with local Federal, State, and municipal officials, and the interests of cooperating agencies are served. The Survey's field offices are local sources of information as to available water resources, fluctuations in the ground water table, and fluctuating stage and discharge of surface streams.

Funds aggregating more than \$5,000,000 were available for water investigations in the fiscal year 1946. Of that amount about 41 percent was appropriated by Congress, about 33 percent was contributed by States and municipalities, and about 26 percent was provided by other Federal agencies.

**Conservation Branch.** The Conservation Branch classifies the public lands of the United States as to mineral and water resources and supervises operations on public, Indian, and naval petroleum reserve land leases, permits, and licenses, for the development of these vital natural resources. The work requires the maintenance of a headquarters staff in Washington and a field staff competent to solve problems of geology, engineering, economics, and administration in complying with legislation

enacted by the Congress, which contemplates that this Nation's resources shall be developed and produced by private enterprise in accordance with approved methods. The activities include field investigations, the preparation of maps and reports dealing with water power, fuels, minerals, and chemicals essential to the postwar economy of the United States, and "on-site" supervision of mining and drilling operations essential to the production thereof.

Initial or revised definitions of the known geologic structure of 71 producing oil or gas fields were prepared and promulgated; geologic appraisal was made of 90 unit-plan or participating-area submissions; some 58 special reports were rendered to the General Land Office on new discoveries of oil or gas on or adjacent to Federal lands, including 22 applications for the royalty benefits of the act approved December 24, 1942 (56 Stat. 1080), for the discovery of new oil and gas fields or deposits during the war emergency; and, for a variety of extra-departmental agencies concerned with the disposal of acquired lands of the United States, determinations were made of the potentialities for fissionable materials of some 970 land parcels in various States, Territories, and possessions, pursuant to Executive Order No. 9701 of March 4, 1946, and to authority for such determinations delegated to the Geological Survey by Departmental Order 2188 of April 19, 1946.

The Geological Survey, in the performance of its functions, provides technical service and assistance to the Office of the Secretary of the Interior, the Office of Indian Affairs, and the Bureau of Land Management in the administration of mineral leases, permits, and licenses, and related problems. It also serves as consultant to the Department of Agriculture on mining permits and leases under the jurisdiction of that Department and supervises production of minerals from public lands by the Metals Reserve Company and the War Assets Administration, successor to the Defense Plant Corporation. Under supervision as of June 30, 1946, were 555 properties on public-domain land under lease, permit, and license, 235 properties on Indian land under lease or mining permit, in 14 States and Alaska.

The production of potassium continued to increase under the impetus of the demand for food production both at home and abroad. More than 99 percent of the national output is produced by four Government lessees, three in New Mexico, one of which operates on public and State land, and one in California, which operates on public and fee land. Prospect drilling in advance of mine development in New Mexico during the year was added substantially to known reserves.

Phosphate production from public domain increased 70 percent over the previous year, and further increase is anticipated as phosphate leases recently issued get into production.

Most of the output of sodium products from public domain is from Searles Lake, California. Refined salts from that source include potassium, borax, soda ash, salt-cake, bromine, burkite, and sodium lithium phosphate. During the war these chemical products were utilized in the manufacture of war materials, such as percussion caps, bombs, flares, shells, smokeless powder, synthetic rubber, armor plate, range finders, bomb sights, and fire-control apparatus. Sodium products are also used in the production of glass, enamel ware, porcelain, soaps, medicines, ferrous alloys, kraft paper, and flame-resisting paints and for fertilizer, water treatment, cleansers, and numerous other purposes for which

consumption is expected to continue at war-time rates.

The Oil and Gas Leasing Division supervises operations for the discovery and production of petroleum, natural gas, gasoline, and butane occurring in public lands of the United States, in naval petroleum reserves, and in all Indian lands subject to Departmental jurisdiction, both tribal and allotted, except those of the Osage Nation, in Oklahoma. During the year these duties were accomplished through 18 field offices and suboffices in California, Colorado, Montana, New Mexico, Oklahoma, Utah, and Wyoming.

On public lands, 8,750 oil and gas properties were under supervision at the end of the fiscal year, aggregating 6,034,397 acres in 20 States and Alaska.

Drilling on public lands during the year included the spudding of 496 wells and the completion of 550 wells, 386 of which were productive of oil and gas and 164 of which were barren. In all, 12,124 public-land wells, including 6,589 capable of oil and gas production, were under supervision on June 30, 1946.

On Indian lands the work of oil and gas lease supervision involved 4,931 leaseholds in 10 States, containing at the end of the year a total of 7,525 wells, 4,042 of which were productive of oil or gas and 163 of which had been completed during the year.

On behalf of the Navy Department supervision was continued over operations for the production of oil, gas, gasoline, and butane from 21 properties under lease in Naval Petroleum Reserve No. 1 in California. Production from 286 active wells on this reserve aggregated 3,918,600 barrels of petroleum, 3,890,000,000 cubic feet of natural gas, and 9,313,000 gallons of natural gasoline and butane, having an aggregate royalty value of \$727,328.

On War Department lands in the Rio Vista gas field near San Francisco, California, the work included the consideration and approval of a number of the revisions in participating percentages for these lands and the computation of royalties due the United States on the gas production allocated to the lands in the amount of 4,397,930,000 cubic feet with a royalty value of \$190,600.

**Publications.** During the year 59 printed publications were issued by the Geological Survey.

Also, during the year, the Division of Map Reproduction printed 1 geologic folio, 59 newly engraved topographic maps, 143 multicolor topographic maps, 13 planimetric maps, 51 preliminary geologic maps, and 6 special maps, making a total of 273 new maps printed and delivered. Reprint editions of 292 engraved topographic maps, 7 multicolor maps and 122 photolithographed State, geologic maps and planimetric, preliminary, and other maps were printed and delivered. Of new and reprinted maps, 694 different editions, amounting to 1,712,610 copies, were delivered.

The Division of Distribution received during the year a total of 722 separate publications, comprising 36 new book reports and pamphlets and 3 reprints; 51 preliminary maps and charts in the series of strategic minerals investigations; 222 new or revised topographic and other maps; 2 Tennessee Valley Authority maps with contours; 408 reprinted maps (topographic, advance sheets, and planimetric); and 1 new geologic folio (No. 227). The total units received numbered 56,720 books and pamphlets (including reprints) 56,765 copies of revised index maps, 1,656,185 topographic and other maps, and 4,540 geologic folios, a grand total of 1,774,210.

The division distributed 66,607 books and pamphlets, 650 geologic folios, and 1,154,793 maps, a grand total of 1,222,050, of which 580 folios and 991,659 maps were sold.

DON L. CARROLL.

**GERMAN LITERATURE.** The year 1946 will probably always be the most chaotic year in the history of German literature. It is almost impossible to review the situation. There exist at present at least nine different areas or varieties of German literature, each subject to different influences and each dependent on different authorities and tendencies, none of which can be called legitimate. Germany has licensed publishing houses in four political zones of occupation, and as far as can be seen, they produce different types of literature according to the directives or the prevailing mood in these zones. The Russian zone obviously favors Johannes R. Becher and his former friends in Russian exile. Britain permits licensed publishers like Goverts in Hamburg, the United States has publishers in Wiesbaden, Munich, Frankfurt and Heidelberg. France has chosen Baden-Baden as a literary center. Leipzig, the old capital of the German book trade, seems thoroughly destroyed. A fifth variety of German literature within Germany is actually managed and financed by occupation forces. The writers here are mainly German "collaborators," many of whom were closely allied to the Nazi Reichsschrifttumskammer a short while ago. Numerous literary magazines have made their appearance. We mentioned (see YEAR BOOK for 1945) *Die Neue Rundschau*, still published by Bermann-Fischer outside of Germany, in Stockholm. In Heidelberg, guided by the philosopher Karl Jaspers, *Die Wandlung* is published. A group of writers belonging to the former staff of the independent and democratic *Frankfurter Zeitung* are at present editing *Die Gegenwart*. Alfred Doebelin, now a French occupation official, edits a rather confused, neo-Catholic magazine, *Das Goldene Tor*. French existentialism enjoys close intellectual relations with the German philosopher Heidegger, in Freiburg; Heidegger is recognized as the founder and prophet of existentialist doctrine. Next to these five intra-German literary zones, we have a rather active literary movement in Austria and a tremendously strong and vital literary activity—closely connected with Germany—in Switzerland. Then there are the European centers of refugee literature in Amsterdam and Stockholm, bound to lose their importance before long; and finally, the strong center of German literature in the United States and certain other countries of this hemisphere.

For some strange reason, it is forbidden to export books from Germany, so that it is impossible to know exactly what is going on behind the paper curtain in the literary field inside of Germany. We have to rely on occasional smuggled volumes and on the reports of returning travelers. Gigantic quantities of German books in homes, shops, and libraries have been destroyed. The demand for books far exceeds the supply. There seems to be a great and genuine urge to read the books of exiles and of banned foreign authors. But the sources of intellectual food are extremely scarce. Literary denazification has partly succeeded. The questionable group which ironically calls itself "inner emigration" has replaced the Nazi favorites of blood and soil. The most famous members of the "inner emigration"—after their mouthpiece Frank Thiess had been revealed as a fascist sympathizer—are the novelist Ernst Wiechert and the poet Werner Ber-

gengruen. To this group may be added Friedrich Alexander Schroeder, Hans Carossa, Erich Kaestner, Friedrich Georg Juenger, Ernst Juenger, Reinhold Schneider, and—far above the others of the group—the noble and venerable figure of Ricarda Huch, who is probably the most distinguished purely literary writer inside of Germany today.

Ernst Wiechert's recent publications are *Der Totenwald* (an epic of his incarceration in a concentration camp), *Rede an die Deutsche Jugend, 1945*, *Okay oder die Unsterblichen* (a weak political satire), and *Märchen*. A volume of poems by Bergengruen, *Dies Irae*, is one of the most widely read new books. We have seen a volume of collected poems by Erich Kaestner *Bei Durchsicht Meiner Bücher*. A volume of essays by Ricarda Huch is announced: *Urphänomene*, and probably the most important postwar document of intellectual Germany is Karl Jaspers' small book, *Die Schuldfrage*.

Switzerland has done exceedingly well in building a shelter for homeless German literature. If one looks at book production of 1946, Switzerland is, indeed, the only place where something like "European culture" remains visible. Production of books in this country has advanced (see SWISS LITERATURE). We find a great number of new publishing houses, printing the best of American, English, French, German and Italian literature. Among the many American books are works by Thoreau, Hawthorne, and Melville, and most of the modern best sellers, as well. Many German books are published under a double imprint—both a Swiss and German publisher being listed—or contain the printed provision that they can be sold only outside of Germany, probably because they have not been duly licensed by one of the occupation authorities.

The outstanding literary event of 1946 is the awarding of the Nobel Prize to the German-born, naturalized Swiss poet, Hermann Hesse. Hesse, born in 1877 in Calw, founded his reputation as a distinguished, sensitive, rather remote poet in 1904 with his novel, *Peter Camenzind*. Others of his better known books are *Unterm Rad*, *Knulp*, *Demian*, and *Steppenwolf*. Many consider his lyrical qualities as higher than his ability to write fiction.

There has been no visible addition recently to German literature in the field of fiction or poetry. But we find a great number of philological, philosophical, historical, biographical, and scientific books of interest or of importance. There is a book on America by Victor Vinde, Fabian von Schlabrendorff has written the story of the secret fight against Hitler in *Officiere gegen Hitler* (to be published in the United States by Macmillan). H. B. Gisevius, a supposed Nazi who collaborated with the American Secret Service, tells his story in *Bis Zum Bittern Ende*. Tristan Busch's *Entlarvter Geheimdienst* has aroused a good deal of interest.

The former Austrian chancellor, Kurt Schuschnigg, has described his adventures in *Ein Requiem in Rot-Weiss-Rot*, to be published here by Dutton. There are at least two books on Thomas Mann: *Thomas Mann* by Ferdinand Lion, and *Stefan George and Thomas Mann* by Hans Albert Maier.

Among other recent books are *Goethe und die Weltliteratur*, by Fritz Strich; *Mimesis, Reality in Western Literature*, by Erich Auerbach; and *Deutsche Literaturgeskichte in Grundzuegen*, by L. Beriger, W. Burkhard, E. Ermatinger, F. Strich and others. A new book by Alfred Weber ought to be of great interest: *Abschied von der Bisherigen Geschichte*, with the subtitle, *Defeat of Nihilism?* an analysis of the present historical situation.

There is a new Schubert biography by Walter and Paula Rehberg. The German edition of Erich Maria Remarque's *Arc de Triomphe*, has been published in Switzerland. A Bismarck biography of three volumes by Erich Eyck has recently appeared, and by the same author, *Die Pitt's und die Fox's*.

Among other new publications are an interesting travel book by R. Katz, *Auf dem Amazonas*, and an excellent biography of Wilhelm Röntgen by Friedrich Dessauer. Friedrich Muckermann, the famous German Catholic liberal, has written a book on the Russian philosopher, Wladimir Solowiew. Hermann Scherchen, the conductor, has published a number of essays on music, *Vom Wesen der Musik*. Emil Ludwig has produced an ill received pamphlet against Siegmund Freud. The famous German historian, F. Meinecke, has published *Die Deutsche Katastrophe*, under the imprint of Brockhaus, Wiesbaden and Aero of Zurich. The Austrian, Jakob Haringer, has had a volume of poems, *Das Fenster*, published; Lernet Holenis, two plays: *Saul, Alkestis*, and Erka Brecht, *Erinnerungen an Hugo von Hofmannsthal*.

The remnant of the Ullstein publishing house has begun to reprint German classics in Vienna. In this field, too, the Swiss have done some excellent work. The Antil-Verlag in Zurich, for instance, has brought out a beautiful edition, in five volumes, of Novalis' collected works, as well as a Theodor Storm in six volumes. A remarkable achievement is the *Schweizer Lexikon* in seven volumes, a collective undertaking of five Swiss publishers and the first reliable German encyclopedia in a long time.

Of special interest to a small but enthusiastic circle of followers will be two new books by the psychoanalyst, C. G. Jung, *Aufsätze zur Zeitgeschichte* and *Psychologie der Übertragung*.

It seems that the most important center of German literature is still the United States. Thomas Mann, recovered from serious illness, is putting the finishing touches to his great forthcoming contemporary novel about a German composer (*Dr. Faustus. The life of the German Composer*, Adrian Leverkühn).

Stefan Zweig's last book, his unfinished biography of Balzac, has become a great success. Lion Feuchtwanger has finished a big novel on Benjamin Franklin and Mirabeau; its German title will be *Waffen für Amerika*. Hermann Kesten has had a well-deserved success with his novels, *The Twins of Nuremberg* (*Die Zwillinge von Nürnberg*) and *Ferdinand and Isabella*. Leopold Schwarzschild's new biography of Marx will soon be published by Scribner's. Leonhard Frank's novel, *Mathilde* (Simon and Schuster) is in the process of translation. *The Magician*, a collection of short stories by the late Bruno Frank, has been well received. Alma Werfel-Mahler's recollections of Gustav Mahler, and Bruno Walter's autobiography have aroused great interest in musical circles. The Schocken Verlag, formerly of Germany and Palestine, newly established in this country, has announced a ten-volume German edition of Franz Kafka's collected works edited by Max Brod—the extraordinary posthumous fame of Franz Kafka is steadily growing, as indicated by a great number of articles and even books about his life and work.

E. Th. A. Hoffmann's *Tales* has been published in an authoritative edition, edited by Christopher Lazare. The Pantheon publishing house, already credited with Grimm's Fairy Tales, has published a splendid edition of Gustav Schwab's *Gods and Heroes*. And, finally, the interesting autobiography

of the German-born painter, George Grosz, *A Little Yes and a Big No*, though written in English, ought to be mentioned.

It is to be hoped that the present diaspora of German literature will soon be ended—technically and spiritually.

MARTIN GUMPERT.

**GERMANY.** A former Federal republic of Central Europe, wholly occupied by Allied military forces for an indefinite period. It is divided into four zones of occupation: Russian (east), American (southwest), British (northwest), and French (west). The former capital, Berlin, is similarly divided into four zones of occupation.

**Area and Population.** The total population of Germany, exclusive of displaced persons and ex-prisoners of war, was estimated at 62,800,000 in June, 1946. This population was divided substantially as follows: United States Zone: 18,700,000; Soviet Zone: 16,600,000; British Zone: 21,800,000; French Zone: 5,800,000; City of Berlin (joint occupation): 3,100,000.

**Government.** By virtue of the declarations of June 5, 1945, the Governments of the United States of America, the Union of Soviet Socialist Republics and the United Kingdom, and the Provisional Government of the French Republic have assumed supreme authority in Germany in all fields and on all levels of administration. This authority is exercised by the Soviet, United States, British, and French commanders-in-chief, each in his zone of occupation. The control of Germany rests in the hands of a Control Council, a quadripartite body composed of the commanders of the four occupying powers. The American member of this council is General Joseph T. McNarney, who is also in command of all American forces in Europe. Immediately under this organization stands the Coordinating Committee, another four-power group, consisting of the officers directly concerned with Military Government. Lt. General Lucius Clay is the American representative on the committee, assisted by Mr. Robert Murphy, his political adviser. General Clay is in command of the Office of Military Government for Germany (U.S.), located in Berlin, which is responsible for the administration of the United States Zone of Germany. The highest level German civilian organization operating under OMGUS is the Laenderrat or Council of States, composed of the Minister-presidents of the three Laender in the U.S. Zone: Bavaria, Greater Hesse, and Württemberg-Baden.

In June, 1946, the United Kingdom accepted the invitation of the United States to the other occupying powers to collaborate with the U.S. Zone in establishing unified economic administration. This resulted in the establishment of a Bipartite Board, operating separately from the Control Council, with a distinct Secretariat to serve it. This Board has bipartite control over Food and Agriculture, Trade and Commerce, Industry, and Transportation. It is contemplated that Communications and Finance will be added in the near future. The area of Greater Berlin is administered by an inter-allied governing authority (Kommandantur) consisting of the four local commandants and their technical staffs. As a result of the Potsdam (Berlin) Conference of July 17 to August 2, 1945, a large area of eastern Germany formerly included in the Soviet zone of occupation was placed under Polish administration. For the governmental set-up in Germany prior to the surrender of that country see *YEAR BOOK* for 1944, p. 248.

**Events, 1946.** German history, in the first full year

of peace, was marked by four outstanding developments: (a) A gradual shift from military rule to representative government; (b) substantial progress towards a reunion of the four zones of occupation; (c) the end of the Nuremberg Trial, and (d) the preliminary spadework on the peace settlement.

**The New Masters at Work.** The highest authority in the occupied Reich, the Allied Control Council, underwent further changes in personnel, early in the year. On February 12, it was announced in London that Air Marshal Sir Sholto Douglas would succeed Field Marshal Montgomery in his triple capacity as Commander-in-Chief of the British forces in Germany, Military Governor of the British zone, and British Member of the Allied Control Council. On April 10, Russia announced a similar change for its zone of occupation, and representation on the Council, with the appointment of Gen. Vassily D. Sokolovsky as successor to Marshal Zhukov. Previously, in November 1945, Gen. Joseph T. McNarney had replaced General Eisenhower as American Commander-in-Chief and Council Member. The French representative on that body, Gen. Pierre Koenig, who had been appointed in July 1945, remained at his post.

Despite many technical difficulties, and recurrent minor crises reflecting the international situation, the Allied Control Council performed a great deal of team-work during the year. For an absolute novelty in international cooperation, it worked out unexpectedly well. With most of the year's work done, Lieut. Gen. Lucius D. Clay, McNarney's deputy, was able to declare on November 4, that disagreements with the Soviet representatives on the Council now were largely matters of detail rather than basic principles.

The first major task confronting the Control Council in 1946 was the curtailment of Germany's industrial capacity and restriction of its output to articles not usable for war, as stipulated by the Potsdam Agreement.

The key decision to be made in this matter was that of the allowable steel production. On this all-important issue, the four members of the Council held widely divergent opinions. The Russians would limit Germany's steel output to 3,000,000 ingots tons a year; the British, in whose zone the bulk of the Reich's heavy industries was located, argued for a 10,500,000-ton limit. The Americans were willing to go as high as 9,000,000 tons, while the French suggested a figure closer to that of the Russians.

After several weeks of debate and haggling, the Council arrived at a compromise which was announced on January 11. The maximum capacity of the steel industry to be left in Germany was fixed at 7.5 million ingot tons, with actual production limited to 5,800,000 tons a year, except by special permission of the Control Council. Although this compromise was hailed, in the January report of OMCUS (Office of the Military Government of the United States) as "a signal triumph for the quadripartite control machinery," subsequent developments indicated continuing differences in interpretations. The British, who had only reluctantly accepted the compromise figure, tried repeatedly during the year to reopen the question; their argument that the economic recovery of Europe hinged on a substantial improvement of industrial activity in Germany, and that this could not be achieved without a higher steel output, was increasingly supported by public opinion in other Allied countries.

On February 2 the Control Council took another important step toward the elimination of Germany's war potential by prohibiting the production of syn-

thetic gasoline, rubber, ammonia, primary aluminum and magnesium, ball and taper roller bearings, heavy machine tools, heavy tractors, and certain war chemicals. Primary war industries, such as plants turning out arms, aircraft, and seagoing vessels, had already been banned in 1945.

Germany's entire seagoing merchant fleet, a total of 1,189,600 gross registered tons valued at \$80,000,000, was divided between the Allies under an agreement announced on March 7. Only 200,000 deadweight tons of inland and coastal shipping, which the Control Council had declared essential for Germany's peacetime economy, were exempted from this measure.

The final determination on the levels of peacetime industry that Germany would be permitted to have was completed by the Council on March 28—almost two months after the deadline originally set at the Potsdam Conference.

Under this plan, German industrial production as a whole was to be reduced to slightly more than 50 percent of its 1938 levels. The output of heavy engineering trades was limited at 31 percent of that year's capacity; that of plants producing heavy electrical equipment at 30 percent; for machine tools, only 11.4 percent of capacity was allowed. The output of basic chemicals was limited at 40 percent, and that of other chemicals at 70 percent of the 1936 volume, with 80 percent allowed for dyestuffs and pharmaceutical products.

Annual production of passenger automobiles and trucks was reduced to 40,000 in each category, plus 10,000 motorcycles, as many farm tractors, and varying numbers of other vehicles. By 1949, exports and imports are to reach 3,000,000,000 marks each, as compared with 4,800,000,000 and 4,200,000,000, respectively, in 1936.

Among other important measures, effective for all of Germany, taken by the Control Council in the following months, were Law No. 25, approved on April 28, which placed a rigid ban on war research; and a decree issued on May 13 ordering the destruction of all German military and Nazi memorials by January 1, 1947; as well as the confiscation of books glorifying Nazism or militarism.

During the summer frequent charges and countercharges of secret military preparations were bandied about among the Allies. The Russian press accused the British of maintaining German armed forces in their zone; the British retorted by charging the Russians with manufacturing arms in captured German plants.

A suggestion made by Secretary of State Byrnes at the Paris Conference of Foreign Ministers, on May 13, that the Control Council set up special four-power commissions to investigate the state of German disarmament in all four zones of occupation was at first coolly received by the Soviet representative, but was later endorsed by him in a somewhat modified form. It was not until October 2, however, that the Council reached final agreement on the question. Quadripartite inspection teams, empowered to check on the liquidation of German war plants in all zones, were formed shortly later and began their tours in mid-November.

On October 14 the Council adopted two important directives, one extending to all Germany the denazification principle, already practiced in the American zone, the other establishing a firmer control over the German press, which, in a number of instances, had indulged in attacks designed to disrupt unity among the Allies.

**The Reparations Problem.** Perhaps the greatest obstacle to harmonious relations in the Control Coun-

cil, during the spring and summer of 1946, was the unsolved reparations problem. This, in turn, was closely tied up with the problem of German economic unity, which appeared even more difficult of solution.

Under the Potsdam Agreement, Germany was to be treated by the occupying powers as an economic unit even though politically it had been carved up into four separate zones. This proviso, however, remained a dead letter. In the beginning, this was chiefly the fault of the French, who stubbornly refused to cooperate in any unification measures as long as their demand for separation, in one form or another, of the Rhine-and-Ruhr district from the Reich remained unfulfilled. The French, however, in keeping aloof had at least the excuse that they had not been invited to the Potsdam Conference and were no party to the decisions taken there. The Russians, on the other hand, did not have this excuse and when they, too, failed to cooperate in the unification measures proposed by the other Allies—in particular an export-import program for all of Germany, proposed by the Americans and British—the latter reacted sharply.

On May 25 General Clay ordered a halt on all reparations shipments to Russia from the American zone, except for material already allocated. In announcing his decision to the Control Council, Clay declared he did not wish to endanger further the productive capacity of the United States zone in case it would have to become a self-supporting unit, contrary to the Potsdam stipulations. At a press interview, a few days later, he added that no further contributions to the reparations pool would be made from the American zone "until the economic unity of Germany, on which reparations are based has been attained." The British followed suit with a similar embargo on reparations from their zone.

These moves caused considerable annoyance in Moscow, and added to the tense atmosphere which prevailed in Paris when the Big Four Foreign Ministers met again in that city in June. In the course of these discussions, Soviet Foreign Minister Molotov on July 9, startled his colleagues with the statement, "The Soviet Government insists that reparations from Germany to the amount of \$10,000,000,000 be exacted without fail because this amount is but a small portion of the enormous damage that has been done to the Soviet Union by German occupation." Secretary of State Byrnes replied that this sum had been mentioned at the Yalta Conference as a basis for discussion but that later, at Potsdam, all, including Stalin, had agreed that it was impossible. The Secretary also gave support to General Clay's action in suspending deliveries on reparations account by stating that, as a result of the failure to treat Germany as an economic unit, the United States was forced to spend \$200,000,000 a year for the maintenance of its zone.

Although the dispute was not settled, and General Clay's order was not rescinded, a report released by OMGUS on October 19, disclosed that up to the end of September the Russians had received 15,500 tons of reparations equipment from the American zone, of which the major portion consisted of materials allocated but not delivered when the suspension order went into effect. The report also showed that a total of 658 industrial plants in the three western zones—mostly armament industries—had been approved for reparations deliveries to all countries.

Meanwhile the Russians had not been idle in their own zone. By all accounts, the Soviet Military Government pursued in the territories under its

command a reparations policy far more drastic than anything seen in the western zones. Its methods, however, changed repeatedly during the year. In the winter and spring of 1946, hundreds of factories, especially in industrial Saxony and Thuringia, were dismantled and shipped to the Soviet Union. Early in June, however, a sudden halt was called to these removals at a conference in Berlin between the Soviet military authorities and German representatives; these included the heads of the five autonomous administrations in the Soviet zone, viz, the States of Saxony, Thuringia, and Mecklenburg-Vorpommern, and the Provinces of Saxony and Brandenburg,—and the chiefs of the twelve central departments for the zone functioning in Berlin. The conference apparently had a political background and the suspension of the dismantling program was generally linked by observers with the series of elections then about to begin in the Soviet zone (see below).

Then, in June and July, the Russians began to gather together industrial plants, previously seized for reparations, in large combines under Soviet State ownership and control. Practically the entire output of these industries,—which included among others the Leuna Works of Merseburg, the Buna Works of Halle, and the Zeiss Works of Jena—was earmarked for shipment to the Soviet Union.

This practice was sharply protested in a British note made public on August 8, which declared that "Unless and until Germany as a whole has an export surplus the Soviet Government, in the explicit and unambiguous terms of the Potsdam Agreement to which it was a party, is not entitled to take by way of reparation goods currently produced or stocks."

Was it this protest, or dissatisfaction with the outcome of the fall elections in the Soviet zone and in Berlin that caused a new reversal of Russian reparations policy? At any rate, in October a new wave of factory removals got under way. This was accompanied by the transfer to Russia of several thousand German skilled workers, engineers, and technicians from both the Soviet zone and the Soviet sector of Berlin.

The first news of this move was broken on October 22 by German Social-Democratic leaders in Berlin who charged that the Russians were carrying out mass deportations in the spirit of "the testament of Peter the Great." Promptly confirmed by American and British officials in Berlin, the report caused a major sensation and the ensuing uproar kept the city astir for weeks. The matter was brought up before the Kommandantur, the Allied governing body for Berlin, which passed it on to the superior authority, the Control Council. The latter, on November 4, quickly dropped the subject from its agenda, after the Soviet representative had produced an Allied Proclamation of August 13, 1945—which the other members of the Council apparently had forgotten long since—explicitly authorizing the use of German "labor, personnel and specialists . . . in Germany or elsewhere as the Allied representatives may direct." The Russian member also declared that no force had been used and that the Germans involved had signed contracts for employment in the Soviet Union. At the same time, the Russian-controlled Berlin radio said that no more German workers were needed in the U.S.S.R. and that "therefore, no further applications are required."

Early in November General Clay confirmed widespread rumors that he had been conducting "exploratory" talks with Marshal Sokolovsky, covering the entire range of American-Russian dis-

agreements on Germany. There were growing indications of an early, comprehensive deal under which the Russians would abandon their unilateral practices in Germany as well as their opposition to zonal unity, and would permit a substantial increase in Germany's steel output, in exchange for a larger slice of reparations from the western zones than had been contemplated by the Potsdam Agreement. Such a deal would be tied in with both the unification measures already in progress in the American and British zones, and the tentative approach to a peace settlement with Germany.

**Toward German Unity.** Noting, in its March 1946 report, that "widely different systems of economic planning and administration and consequently unrelated economic programs have developed in each of the four zones," the American Military Government took the initiative in ending this state of affairs so contrary to the letter and spirit of the Potsdam Agreement. When it became apparent that French opposition to any kind of unification program could not be overcome, and the Russians did not yield to the pressure put on them in the reparations question, the only way left to end this deadlock was a bipartite arrangement involving the American and British zones.

The first definite proposal to merge the two zones economically was made on July 15 by Secretary of State Byrnes in a broadcast from Washington. The Secretary also disclosed that he had instructed the American authorities in Germany to establish economic collaboration with any of the occupying powers willing to cooperate with the United States zone "in essential administrative matters like finance, transport, communication, trade and industry." On July 20, General McNarney repeated this offer to the Control Council but obtained a favorable response only from the British representative.

After waiting in vain several days for the Russians to join in, the British Government on July 29 announced its acceptance of the American proposals. Orders were sent immediately to British military authorities in Germany to proceed with setting up joint economic agencies. This move was denounced on August 4 by the Moscow radio, which declared that the amalgamation of the two zones was "insisted upon first of all by the big American and affiliated British monopolies which seek the complete subordination of German economy to their selfish interests."

On August 10, the French Government formally rejected the British-American merger project and proposed instead the creation of inter-Allied economic bureaus dependent on the Control Council. This suggestion was turned down by the United States and Great Britain on the ground that the Potsdam Declaration had stipulated the establishment of German, not Allied, central agencies in the economic field. After that, the French consistently blocked any unifying measures proposed in the Control Council. They even refused to introduce in their zone the new German postal stamps approved by the Council on September 17 for the other three zones. And on October 29, their opposition killed a motion supported by the American, British, and Russian members of the Council to permit the amalgamation of political parties on a nation-wide basis.

A great step forward on the road to German unity was taken on September 6 when Secretary of State Byrnes in an important speech at Stuttgart reviewed and restated American policy in Germany. Significantly, the Secretary's address was delivered at the seat, and before representatives of the Laenderrat, the German agency created in Oc-

tober 1945 to coordinate and supervise the policies of the three autonomous states of the American zone, Bavaria, Württemberg-Baden, and Greater Hesse. From the start, the Laenderrat was the nearest approach to a representative provisional German Government yet developed in any of the four zones and it was obviously designed to form the nucleus from which a future central German government could be developed.

In his Stuttgart speech Byrnes made it clear that he favored the early establishment, not only of central economic agencies, but also of a provisional German government, which he envisioned as "a German national council composed of democratically responsible minister-presidents or other chief officials of the several states or provinces which had been established in each of the four zones." (On a smaller scale, the Laenderrat of the United States zone constituted just such a council.) The provisional government or national council, Byrnes suggested, should then be charged with preparing the draft of a democratic constitution for Germany.

In the meantime considerable progress had been made in the military and civilian committees charged with the task of working out the details of the proposed fusion of the American and British zones. At an early stage in these discussions it was realized by all concerned that such a merger could be made effective only if the political organization of the British zone were adapted to the pattern already existing in the American zone. Up to that time, the evolution of self-government in the British zone had lagged far behind developments in the United States zone. The British military authorities were still exercising direct control at all administrative levels, with the subordinate German agencies fulfilling only advisory functions. The discrepancy between the two regimes was so wide that, in the preparatory talks on the proposed merger, the delegates from the American zone were empowered to make decisions on the spot, whereas those from the British zone had to refer all suggestions back to their military chiefs.

In the last days of August the British Military Government took a decisive step to overcome this variance and place the German officials in the two zones on an equal footing by transforming the provinces of Hanover, North-Rhine-Westphalia and Schleswig-Holstein into autonomous states (Laender) on the model of those existing in the American zone. The small Laender of Oldenburg, Brunswick, Lippe and Schaumburg-Lippe, which had previously existed in the British zone were marked for absorption into Hanover, which thereafter would become the state of Lower Saxony. Hamburg and Bremen were again to become independent cities with their own administrations and legislative councils. The entire reorganization was scheduled to be completed by January 1, 1947, at which time the British military authorities promised to devolve "full governmental powers" on the new German state and city administrations.

On the same date the economic merger of the American and British zones was to become effective with the assumption of administrative responsibility by five bizonal agencies created early in September. These were: (a) a central economic bureau set up at Minden; (b) a department of finances, with headquarters at Frankfurt; (c) a department for food and agriculture at Bad Kissingen; (d) a department for transportation, with headquarters at Bielefeld and a branch office for maritime ports and coastal shipping in Hamburg; and (e) a department for communications at a still unspecified location.

With economic unification thus well under way, the Laenderrat on September 28 proposed to the American and British military governments that the two zones also be politically joined together under a bizonal council of states. This request, however, was turned down because, as General Clay explained early in October, "such political unification of the two zones might be misunderstood by the Russians and French, and thus be a bar to chances for unification of all four zones, which we very much desire."

On October 4-5 the first interzonal conference of minister-presidents and other chief executives of the state and city administrations in the American and British zones was held at Bremen. The chief officials of the Soviet and French zones had also been invited to attend, but excused themselves, for obvious reasons. The conference unanimously called for an early establishment of the German national council proposed in Byrnes' Stuttgart address. It added the suggestion that this provisional government be placed under the parliamentary control of a Volksrat (people's council), composed of representatives of the various state assemblies.

In a similar vein, Foreign Secretary Bevin told the House of Commons on October 22 that he envisioned a German central government consisting of two chambers, one to be popularly elected, and the other representing the regional units. There might be a supreme court similar to that of the United States, he added.

A week later, Premier Stalin, in a formal statement to the United Press declared "It is necessary to re-establish, not only the economic, but also the political unity of Germany." He also expressed himself in favor of the early establishment of a German central administration.

This important declaration of the Soviet leader, heralding a reversal of the earlier Soviet policy in the matter, came in the midst of the above-mentioned informal talks between General Clay and Marshal Sokolovsky on the reparations problem and related issues. It also coincided with the first definite preparations for a practical approach to the most difficult problem of them all: the peace treaty with Germany.

**Laying the Basis for Peace.** Although it was generally agreed that Germany was the principal question in Europe, progress toward a settlement with that chief enemy country was slow and gingerly, especially in the first part of the year. It was as though all the Allies desired to put off as long as possible the problem that loomed as the greatest potential source of discord among them. But no matter how skilfully avoided, the German problem was there, and, as the months went by, its impact was felt increasingly at international conferences.

Officially, Germany was not on the agenda of the Big Four Foreign Ministers' meeting in Paris. A French attempt to include it in the discussions was turned down on April 26, by British Foreign Secretary Bevin on the ground that he could not commit himself on Germany until the British Dominions, as well as Germany's small neighbors, had been consulted. As the conference proceeded, however, the United States delegation became more and more convinced of the vital necessity of early discussions on Germany.

In a frontal attack on the problem of security that had worried the French most, and, to a lesser extent also, the Russians, Secretary of State Byrnes on April 29, proposed a 25-year four-power treaty to keep Germany disarmed. This suggestion, however, was coolly received by the Soviet delegation and nothing came of it. On May 15, shortly before

the conference adjourned, Byrnes urged his colleagues to agree to the holding of a special peace conference on Germany no later than November 12. In the meantime, he suggested, the Ministers' deputies should go to work on a draft settlement. This proposal was again turned down by the Russians and the German problem was left up in the air. On July 10, after the Council of Foreign Ministers had resumed its meetings in Paris, Byrnes repeated his suggestion that special deputies be appointed to deal with Germany. Soviet Foreign Minister Molotov considered this procedure premature but agreed in principle to a special meeting on Germany before the end of the year. In one of his most important speeches of the year, Molotov also outlined to the Council his ideas on the future of Germany. He opposed French claims for separation of the Ruhr and strongly repudiated the "Morgenthau doctrine" of an agrarian Germany.

The Paris Peace Conference in August also kept Germany off its agenda, limiting its discussions to the former satellite countries. But, as a *New York Times* correspondent put it, "Like an ugly duckling that nobody wants to see, the German problem has wandered in the back door of the Paris Conference." It proved impossible to draw up settlements with the former Axis countries without constantly harking back to the dominant question—Germany.

In his Stuttgart speech (see above) Mr. Byrnes again called for a start toward a peace settlement with Germany. "More than a year has passed since hostilities ceased," he said, "The millions of German people should not be forced to live in doubt as to their fate. It is the view of the American Government that the Allies should, without delay, make clear to the German people the essential terms of the peace settlement which they expect the German people to accept and observe."

A change in Soviet policy, parallel to that on reparations and German economic unity, became discernible in October. Without fanfare, the spadework on the German treaty was begun in the meetings of the Allied Control Council in Berlin. By October 31, the ground had been sufficiently cleared to permit Mr. Byrnes to announce in Washington that consideration of the German peace treaty would begin about November 20 after the Foreign Ministers, meeting in New York, had finally disposed of the five treaties with the former Axis satellites. The Secretary also disclosed that he had requested General Clay and his political adviser, Ambassador Robert D. Murphy, to come to New York for consultation prior to the start of negotiations on Germany.

**From Military Rule to Self-Government.** Political life in Germany received a powerful impetus in 1946, as in one zone after another the voters were called to the polls in the first free elections since 1933. In line with these democratic processes, a gradual retraction of military authority and a corresponding expansion of German administrative responsibility took place everywhere, though in widely differing proportions.

The American Military Government took the lead in both respects. Having already developed the framework of German self-government in the fall of 1945—by setting up three autonomous states linked together through the *Laenderrat*—it proceeded early in 1946 to organize the first elections, far ahead of all other zones.

The first step was the holding of local elections in 11,000 rural communities and townships of less than 20,000 population, on January 20 and 27. Some four million persons were entitled to vote in the three states, and the average turnout was 88

percent. As had been expected, the Christian Democratic Union (Catholic party) scored an overwhelming victory in Bavaria and the largest total for the whole zone, 1,454,779 votes; the Social-Democrats were second with 980,787; and the Communists third with 136,404.

In the second round, on April 28, when elections for county councils (Kreistage) were held in the zone, participation was considerably less, only 72.2 percent on the average. The returns followed closely the pattern of the January polls.

A different picture appeared in the elections held on May 26, in towns and cities of more than 20,000 population. Of 1,684,456 votes cast the Christian Democrats obtained 667,991 as compared with 635,017 for the Social-Democratic party. The Communists polled 149,693, and the Liberal Democrats, who had made a pretty poor showing in the rural areas, garnered 102,584 votes. Participation was about 80 percent this time.

Far more important than any of these preliminary polls were the June 30 elections for constituent assemblies in the three states. Yet, strangely enough, the turnout of voters was less than on any of the preceding occasions—only 70.9 percent on a zone-wide average. Once again the Christian Democratic Union maintained a commanding lead with 2,579,403 votes against 1,815,535 for the Social-Democrats; 406,009 for the Communists; and 386,358 for the Liberal Democrats.

As a result, the Christian Democrats obtained an absolute majority of 109 out of 180 seats in the constituent assembly of Bavaria. In that of Greater Hesse, the Social-Democrats took the lead with 43 seats out of 90, against the Christian Democrats' 34. In the state of Württemberg-Baden, the assembly was composed of 41 Christian Democrats, 32 Social-Democrats, 17 Liberal Democrats and 10 Communists.

Through the summer and fall, the three constituent assemblies were busy approving and amending the constitutional drafts already prepared for them by committees of experts appointed by the state governments. In accordance with the election results, three varying drafts emerged from these discussions and were submitted to General Clay for approval. While the Hessian projects showed a distinct Socialist trend, the Bavarian draft constitution reflected the conservative, clerical, and separatist tendencies of the dominant Christian Democratic Union.

Württemberg-Baden was the first state to complete its draft constitution which was passed on October 24 by an 88 to 1 vote of the assembly and was approved by General Clay with minor modifications. In giving his approval to the Bavarian constitution on October 26, however, Clay warned that separatist activities would not be tolerated by the Military Government. The general also objected to an article in the Hessian draft which made the nationalization of key industries mandatory. Eventually a compromise was reached under which the socialization issue will be voted upon separately by the people of Greater Hesse. With this reservation, the draft was approved by Clay on October 30.

In their completed form, the three constitutions provide for the election, in each state, of a *Landtag* or Legislature with a four-year term, which in turn elects the Minister-President or Premier. Bavaria alone adopted a bicameral system with a 60-man Senate serving in an advisory capacity beside the *Landtag*. A proposal to introduce the office of State President into the Bavarian constitution was finally defeated after a bitter and protracted battle in the constitutional assembly.

The completed draft constitutions were submitted for final approval by the electorate on November 24 in Württemberg-Baden, and on December 1 in the state of Greater Hesse and also in Bavaria. Since all three were elaborate compromises between the different views of the major parties, their final adoption was a foregone conclusion. At the same time as the referendum on the constitution, the first ordinary election to the Legislature was held in each of the three states.

With the machinery of democratic government thus set up everywhere in the United States zone, the Military Government prepared to step aside at the end of the year, except insofar as basic occupation policies were concerned. Only demilitarization and reparations will remain as direct administrative responsibilities of the Military Government in 1947, while it otherwise will restrict its activities to observing, inspecting and advising the German civil governments. General McNarney revealed on November 7 that American occupation forces in the European theatre had been reduced to 220,000 and would eventually dwindle to 150,000 when the police-force stage of the occupation begins on or about July 1, 1947. He added that the occupation of Germany would last ten to fifteen years.

**Elections in the Soviet Zone.** In the Russian zone of occupation, electoral processes were held up for months by a political maneuver of great moment and decisive impact on subsequent events—the creation of the Socialist Unity Party.

When political life first was revived in the Soviet-occupied areas of Germany, by Marshal Zhukov's order of June 10, 1945, four parties were given legal status. They were the Communist party or K.P.D.; the Socialist-Democratic party or S.P.D.; the Christian Democratic Union or C.D.U.; and the Liberal Democratic party or L.D.P.

During the first months of occupation, the Soviet military authorities maintained an attitude of impartiality and non-interference towards these political groups, all of which were considered to have a fundamentally "anti-Fascist" outlook. Indirectly, however, the Russian authorities gave the K.P.D. preferred status by turning over a disproportionately large number of administrative posts to Communist candidates, both in Berlin and throughout the Soviet zone.

Before long, however, it became evident that the Social-Democrats still were, as they had been in the pre-Hitler period, the strongest political party in Berlin and also in at least some of the Russian-held provinces. The K.P.D., on the other hand, made not nearly as many converts as had been expected. Thus the Soviet Military Government was faced with the disagreeable prospect of seeing its favorite party take a thorough beating at the first free elections, and its appointees being swept out of office and replaced by Social-Democrats.

To forestall such a contingency, the Soviet Military Government agreed with the Communist leaders, Wilhelm Pieck and Walter Ulbricht, that the best course would be to merge the two workers' parties into one to be called the Socialist Unity party or S.E.D. This would be ruled by an ostensibly bipartisan board, but would, in effect, be dominated by the Communists.

The Social-Democratic leaders in Berlin balked at the merger proposal but agreed nonetheless to a limited cooperation with the Communists. In the western zones, however, where they were freer in their decisions, the S.P.D. leaders refused to have anything to do with the Communists. As a result, a serious split developed in the ranks of the S.P.D., which grew worse as Russian pressure on the Ber-

lin faction and provincial organizations in the Soviet zone increased, while at the same time the western leaders of the party stiffened in their stand with the blessing of the American, British, and French military authorities.

On April 7 a break occurred in the Berlin organization of the S.P.D. At a meeting called by "insurgent" Social-Democrats in the western (non-Russian) sectors of the city, Otto Grotewohl, chairman of the party, and several associates were "expelled" and a new board was elected. Grotewohl and his friends, ignoring the action of the dissidents, went ahead with their plans for a merger with the Communists and on April 20 the S.P.D. and K.P.D. organizations throughout the Soviet zone, including the Soviet sector of Berlin, were amalgamated in the new unity party, the S.E.D. Pieck and Grotewohl were elected co-chairmen of the new party, which automatically became the dominant political organization in the Russian-held parts of Germany, while it was not recognized, or even allowed to operate, anywhere else. Thus the political division between the two Germanies, eastern and western, was deepened at a time when, on a different level, attempts to reunite the Reich were in progress (see above).

With preparations for the party fusion well under way, the Soviet Military Government late in March set the dates for the first elections to be held in the zone, municipal in September, county councils and state assemblies in October.

As a prelude to this series of ordinary polls, the state government of Saxony, on June 30, held a plebiscite on whether or not Nazi-owned factories and business enterprises in the state should be expropriated. Since this had already been done by decree of the Military Government, and since, moreover, the other political parties—C.D.U. and L.D.P.—joined hands with the S.E.D. in urging the voters to answer "yes," the result was a foregone conclusion. Of 3,459,658 ballots cast, 2,683,401 or 77.7 percent were "yes" and 571,600 or 16.5 percent were "no" votes.

The first test of party strength in the Soviet zone came at the municipal and communal elections, which were held on September 1 in the state (Land) of Saxony, on September 8 in the province of Saxony and in the state of Thuringia, and on September 15 in the state of Mecklenburg and in the Province of Brandenburg. The turnout was exceptionally heavy everywhere, averaging more than 90 percent.

That the vote was technically fair was attested by impartial observers. American correspondents, who visited polling places in various states and provinces, found no signs of coercion or intimidation and reported that the ballot was secret and the counting fair. They also agreed, however, that in the election campaigns, the S.E.D. had been heavily favored by the Soviet authorities, especially in the allocation of newsprint, paper for handbills and posters, and other campaign facilities. Moreover, in many rural communities, C.D.U. and L.D.P. had been effectively prevented from putting up candidates and the S.P.D., being officially dead in the zone, was not permitted to participate in the voting.

Under the circumstances, it was hardly surprising that the S.E.D. should come out with absolute majorities in all regions. It obtained 55.5 percent of the ballots cast in the State of Saxony; 60.2 in the Province of Saxony; 53.4 in Thuringia; 59.5 in Brandenburg; and 69.9 in Mecklenburg-Vorpommern.

Despite these paper majorities, however, the

S.E.D. failed to win the decisive victory which its sponsors, both German and Russian, had expected, and its absolute control of the Soviet zone did not last long. This became evident at the October 20 elections of county councillors and state assemblymen, in the five regions of the Soviet zone.

At these, far more important, elections—the state assemblies were to write new constitutions, like their counterparts in the American zone—9,767,897 voters cast valid ballots, or about 850,000 more than in September. (In the time between the two polls, more persons had qualified for the suffrage, and the number of invalid ballots was considerably less than in October). Of this total, the S.E.D. obtained 4,658,925; the L.D.P., 2,410,146; the C.D.U., 2,398,035; the remainder of the ballots went to various small groups, of which the most important, the Bauernhilfe or Peasants' Aid, garnered 282,930. Thus the S.E.D. lost its absolute majority in all five regions, and in the zone taken as a whole. With the addition, however, of the votes obtained by the allied Peasants' Aid group, it retained slim majorities in the three states of Saxony, Thuringia, and Mecklenburg-Vorpommern.

**The British and French Zones Vote.** As they lagged behind in the transfer of governmental responsibility from the military authorities to German organs, the British and French zones were also the last to hold elections. The voting procedure was parallel in the two zones: communal elections in rural areas and towns of less than 20,000 population were held on September 15, the larger towns and cities voted on October 13, and at the same time county councils were elected in both zones. Zone-wide polls for provincial legislatures or state assemblies were not expected to take place before some time in 1947.

In the British zone, a voting system markedly different from those applied elsewhere was used. The emphasis was on the election of individual candidates rather than party lists in the traditional German manner. The voting procedure was involved and the results were confusing in that the total of valid ballots cast was far in excess of the number of qualified voters, and the distribution of seats did not wholly correspond to the strength of the various parties.

Contrary to expectations, not the S.P.D., which had received a good deal of unofficial backing by the authorities, but the C.D.U. emerged as the strongest political party in the British zone. On September 15, it polled 6,863,948 votes, or 38.3 percent of the total cast, as compared with 6,267,699, or 34.9 percent for the S.P.D. A large number of "independent" candidates accounted for 2,718,558 ballots, or 15.2 percent of the total. A separatist-minded group in Lower Saxony, the so-called Welfen (Guelph) party, garnered 1,080,185 votes, or six percent; the Communists trailed behind with 992,745 votes, or 5.6 percent.

The distribution of seats resulting from this vote was as follows:

Independents .....	23,343 seats
C.D.U. ....	20,621 "
S.P.D. ....	16,172 "
Communists .....	694 "

The larger city vote, on October 13, showed a somewhat different picture. This time, the Social-Democrats polled the largest number of ballots cast, 11,179,521, but they obtained only 2,549 seats as against 3,518 for the Christian Democrats with their slightly smaller popular vote of 11,029,953. The Communists, who received the third largest popular vote—2,413,419—had to content themselves with only 139 seats, less than the Lib-

erals with 317 seats (1,988,364 votes) and the Guelf party with 325 seats (1,413,891 votes).

In the French zone, the Christian Democrats took a wide lead at both the communal elections of September 15 and the voting for county councils on October 13. At the former, 2,860,064 persons—about 85 percent of those qualified—cast their ballots of which 1,273,574 went to the C.D.U.; 563,507 to the S.P.D.; 180,466 to the K.P.D.; and 87,015 to the L.P.D.

**The Berlin Election.** Of all the voting contests in Germany in 1946, none commanded as wide an interest and aroused as much comment as the Berlin municipal election on October 20. For here was the only battleground where the Soviet-sponsored S.E.D. could meet its chief rival, the S.P.D. This was the result of a laborious compromise worked out, on May 29, in the Allied Control Council which decided to give full recognition and liberty of propaganda to both the newly formed S.E.D. and the revived S.P.D. in all sectors of Berlin.

After a bitterly fought campaign, which lasted for several weeks, 2,091,055 Berliners (out of 2,349,722 qualified to vote) went to the polls under the watchful eyes of four occupying powers. Of the valid ballots—only 39,164 were declared invalid—999,170 or 48.7 percent were cast for the S.P.D.; 454,202, or 22.1 percent for the C.D.U.; 405,992, or 19.8 percent for the S.E.D.; and 192,527, or 9.4 percent for the L.D.P.

This sensational outcome of the Berlin contest of strength provided a clear-cut vindication of the assertion by the western S.P.D. leaders that the party merger in April had been a fake, made only at the top without support from the rank-and-file of the Social-Democratic party. The so-called Socialist Unity party not only was foiled in its bid for supremacy in Berlin, but it was relegated to third place, behind the Christian Democratic Union. By the same token, the Berlin election clearly indicated a preference of the German voters for the western rather than the eastern brand of democracy.

As a result of this poll, the S.P.D. took 63 seats in the new City Council, against 30 for the C.D.U.; 25 for the S.E.D.; and 12 for the L.D.P.

**The Nuremberg Trial.** "Most of Germany's major war criminals will be in their graves well before Christmas." This prediction, made in August 1945 by a member of the four-power committee, devising a legal code and methods of procedure for the trial of Hermann Goering and company, came true—a year later. Not even the experts foresaw at the time the proceedings were started that it would take fourteen months to bring the Nazi ringleaders to the gallows by legal process.

Through winter, spring, and summer, the Nuremberg Trial went its cumbersome course. After the initial spurt of world-wide interest when the trial began on November 20, 1945 (see the 1946 YEAR BOOK), it was deserted by the reporters and almost forgotten by the public, until the inevitable climax. By the time the Nuremberg Trial ended on August 31 with the final pleas of the 21 defendants in the dock, it had become the longest continuous trial in history, with 403 open sessions, during which five million words had entered the records.

The basic verdict of the International Military Tribunal was read on September 30. The court declared the Nazi Leadership Corps, the SS, the SD (Security Service) and the Gestapo to be criminal organizations, but declined to include the SA, the Reich Cabinet, the General Staff, and the High Command in this collective condemnation.

The individual verdicts and sentences were pro-

nounced on the afternoon of October 1. Of the 22 accused only three—Schacht, von Papen, and Fritzsche—were acquitted. Twelve were sentenced to death by hanging: Goering, von Ribbentrop, Keitel, Kaltenbrunner, Rosenberg, Frank, Frick, Streicher, Sauckel, Jodl, and Seyss-Inquart; the missing Martin Bormann also was sentenced to death in absentia. Hess, Funk, Raeder, von Schirach, Speer, von Neurath and Doenitz received prison terms, ranging from life for the first three named to ten years for the last. The Soviet Justice J. I. Nikitchenko dissented in a formal statement from the three acquittals and Hess' sentence of life imprisonment, instead of death.

Sixteen of the defendants appealed their sentences to the Allied Control Council which rejected them all on October 10. Even as the final preparations were made for the hanging of the eleven condemned prisoners, Goering, on the night of October 15, managed to commit suicide by swallowing a vial of potassium cyanide which, as a subsequent investigation showed, he had kept in his possession from the day of his surrender. The other ten were hanged in the Nuremberg jail yard in the early morning hours of October 16.

The seven war criminals sentenced to prison terms were transferred to the Spandau Prison in the British sector of Berlin. Schacht, von Papen, and Fritzsche after their release from the Nuremberg jail were promptly booked for trial before German denazification courts. A number of leading Nazi industrialists and financiers also were expected to go on trial early in 1947, along with the yet untried Reich Cabinet members and war leaders. Most of them will face military tribunals in the American zone. See the article: NUREMBERG TRIALS.

**Denazification.** The American Military Government's policy of devolving upon the Germans the greatest possible amount of administrative responsibility at the earliest possible time was almost upset, toward the end of the year, by the lack of effective action against Nazi offenders. Following a detailed study of the records of German purge tribunals, the Military Government decided that the mills of denazification not only were grinding with extreme slowness, but were frequently going in reverse.

In an angry speech to the Laenderrat on November 5, the Deputy Military Governor, General Clay, declared himself "sorely disappointed" with the results of the purge so far. "It appears more and more," he said, "that the denazification process is being used to return as many people as possible to their former vocations, rather than to find and punish the guilty." He then gave the three Minister-Presidents of the American zone sixty days to show "real and rapid improvement" in this situation, or else the Military Government would take back the job of denazification "regardless of the effects on the German economy."

This was the sharpest rebuke yet delivered by General Clay to the organs of German self-government, which he himself had done so much to create and advance, and it precipitated a crisis in relations between the Military Government and the German state administrations. Two of the three denazification ministers in the zone immediately tendered their resignations, but these were not accepted. Toward the end of the year, indications were that the German officials and tribunals had taken General Clay's challenge to heart and were acting accordingly. It was not expected that the Military Government would have to take back the responsibility for denazification at the end of the sixty days. But even with all the desired speed and efficiency,

the denazification job was expected to take years. In the American zone alone, General Clay revealed, some 2,500,000 persons were charged with one of five degrees of Nazism, and 72,000 of these were being held in jail or detention camps.

**Economic Conditions.** The economic situation in Germany remained grave, improving only slightly toward the end of the year. Production, both agricultural and industrial, was highest in the Soviet zone, but sweeping requisitions for the Red Army and on reparations account (see above) reduced the amounts of food and consumer goods available for the civilian population to more or less the same levels as in the western zones. Conditions were worst in the British zone, where they tended to deteriorate rather than improve in the latter part of the year.

At the bottom of the economic crisis in the British zone was a Ruhr coal production altogether insufficient to meet both allotments to the western countries, and minimum requirements of the local industry. Realizing this, the British Military Government in mid-November drastically curtailed deliveries of Ruhr coal to France, despite vigorous protests from Paris.

The unsatisfactory output of coal, like the industrial stagnation in general, was largely due to absenteeism and inefficiency caused by the prolonged, severe food shortage. Rations fluctuated during the year, but remained consistently below minimum requirements. On April 1, the normal consumer ration in the American zone was cut from 1,550 to 1,275 calories daily. In the British and French zones, where outright starvation prevailed in the spring, the daily ration was 1,014 and 1,075 calories respectively. Food riots occurred repeatedly in the British zone, especially at Hamburg, and food thefts were frequent.

In the course of the economic fusion of the American and British zones (see above), food rations were gradually equalized in the two areas and on October 14 they were brought back to the 1,550 calories level. Early in November, however, a new, particularly severe, food crisis broke out in the British zone, causing momentary panic among the Germans and grave concern in London. Food supplies rushed from the United States and from the American zone in Germany temporarily relieved the situation, but the outlook for the winter remained dark.

**Industry.** Monthly U.S. Zone production of various basic industrial items was at the following levels in August, 1946, in metric tons: Coal (Hard) (This figure includes all zones of Germany): 5,902,200; Coal (Brown) (This figure includes all zones of Germany, exclusive of the French Zone.): 14,310,000; Iron Ore: 70,565; Pig Iron: 25,387; Ingot Steel: 18,834; Copper: 1,334; Lead: 200; Zinc: 166; Aluminum: 897; Magnesium: 36; Iron and Steel Castings: 10,395; Steel Rolling Mill Products: 14,076; Potash: 93,847; Salt: 35,138.

In August, also, monthly generation of electric power was 435,400,000 Kilowatt Hours; production of manufactured gas, 45,327,000 cubic meters; lumber, 282,000 cubic meters.

**Agriculture.** The following levels are estimated for the harvest of principal crops in the U.S. Zone of Germany for 1946, in metric tons: Wheat: 864,000; Rye: 703,000; Potatoes: 6,046,000; Sugar Beets: 847,000; Barley: 456,000; Oats: 683,000.

**Transportation.** German railroads in the U.S. Zone were in possession, July 1946, of the rolling stock listed in the table at the top of column 2.

The number of trains operated per day as of July 31, 1945 was as follows: Passenger Trains: 881;

	German	Foreign	Total
Locomotives .....	7,233	252	7,485
Passenger Cars .....	11,852	1,324	13,176
Freight Cars .....	78,050	61,421	139,471

Freight Trains: 800; Other Trains: 459; Total Trains: 2,140.

Monthly volume of cargo moved by highway transport, U.S. Zone, was 2,228,941 metric tons in June, 1946. On August 1, 1946, 591 river barges, with a capacity of 597,255 tons, were in operation. Out of a total of 10,570 bridges in the U.S. Zone, 10,501 were in operation at the end of August.

**Manpower.** German labor offices, at the end of June, 1946, had registered a total of 32,018,000 persons. This total was broken down as follows: U.S. Zone: 6,999,000; Soviet Zone: 8,557,000; British Zone: 11,865,000; French Zone: 2,615,000; Berlin: 1,982,000. It included 16,159,000 male and 15,859,000 female registrations. Of the total, 23,819,000 were employed, either for wages or as family helpers. Of the unemployed, 6,801,000 were classified as unemployable by reason of exemption or disability, leaving only 1,398,000 persons unemployed, though capable of gainful activity.

**Education.** The U.S. Zone and the U.S. Sector of Berlin had the following level of school enrollment on July 1, 1946:

Type of School	No of Pupils	Teacher Employed
Elementary Schools . . . . .	1,952,839	24,732
Secondary Schools . . . . .	187,853	6,219
Vocational Schools . . . . .	201,477	2,713
Special Schools . . . . .	4,369	183

**Finance.** The net governmental deficit of the U.S. Zone amounted to RM 585,000,000 for the fiscal year 1945. Tax collections during the fiscal year averaged only 40% of similar collections during fiscal year 1944, but the Allied Control Council has drastically increased the rate schedules of many important taxes, and this will produce additional revenue during the fiscal year 1946. It is estimated that, excluding income taxes, the average effective tax rate in Germany is now about three times the average rate for the period 1933-1937.

Bank deposits in the U.S. Zone amounted to RM 64,500,000,000 on March 31, 1946. Of this total, RM 17,000,000,000 (26%) had been deposited since the beginning of the occupation. Total bank credits granted from September 1, 1945 through March 31, 1946 were RM 2,466,300,000, of which RM 1,767,800,000 (72%) had been repaid.

JOACHIM JOESTEN.

**GOLD.** Mining of gold in the United States resuscitated slightly in 1946, but lack of labor and equipment and rising production costs prevented a full revival from the dormancy enforced by government order during the war.

Although the restrictive order had been revoked by the War Production Board, effective July 1, 1945, little recovery was shown during the balance of that year and the early months of 1946. Strikes in the copper mines, which contribute important portions of the nation's gold output as a by-product, held down total gold production until settlement late in June. With the coming of the summer season, however, many placer mining operations, particularly in Colorado and Alaska, resumed for the first time since the war. These, together with reopened underground mines, pushed the year's total production gradually upward reaching a total of about 1,500,000 fine oz. for the United States and Alaska (1945: 954,576 fine oz.). The 1946 total

was the lowest during peacetime on record, and compares to 4,750,000 fine oz. produced in 1940.

California and South Dakota, with approximately the same total production, led the gold-producing states, with Alaska producing at a comparable rate during the summer. Utah, where most gold is mined in conjunction with base metals, Nevada, Arizona, and Colorado produced substantial amounts. South Africa again was the world's leading producer, followed by Canada.

The United States Treasury price for gold remained at \$35 per fine oz., but Canadian action in raising its currency to parity with the United States dollar, in effect, reduced the price of gold in Canada from \$38.89 to \$35.00. The action was regarded as a severe blow to Canadian gold miners.

CHARLES T. POST.

**GOLD COAST.** A colony in British West Africa, seat of the West African Council. Attached to the Gold Coast for administrative purposes are the following: Ashanti and the Northern Territories (inland) and Togoland (British mandate). Area, including the territories administered, 91,843 square miles. Population (1942 estimate), 3,962,692. Capital, Accra (72,977).

The colony is administered by a governor, with the assistance of an executive council and a legislative council. Constitutional reforms were introduced in the Gold Coast in 1945-46, and as a result the new legislative council of 31 members contained 21 African members, 18 of whom had been elected. The Governor, Sir Alan Burns, in opening the reformed Legislative Council on July 23, 1946, read a message from the King, which stated: "It is a source of gratification to me that it has been found possible to entrust the people themselves, through their elected representatives, with a wider measure of control of their own affairs." Mr. George Hall, then Secretary of State for the Colonies, sent a message describing the new Legislative Council arrangements as "a landmark in British tropical Africa."

As an increasing degree of responsibility for government was given to Africans, activity on their part grew proportionately. C. W. Tachie-Menson, an African who had been a member of both the Executive and Legislative Councils in the Gold Coast, was one of the members appointed to the West African Airways Corporation for an initial period of 12 months. The Gold Coast was particularly vocal in its support of the majority report of the Commission on Higher Education in West Africa, favoring a university college in each colony rather than a unitary West African university in Nigeria. Opposition was continued in the Gold Coast to the British control plan for cocoa prices in West Africa, first proposed by the Churchill Government and announced in a White Paper by the Attlee Government on November 20.

The chief agricultural products are cacao (for which the Gold Coast is the world's most important area), kola nuts, palm kernels, copra, rubber, maize, and yams. Timber is produced and gold, manganese, and diamonds mined in considerable amounts. In recent years exports have exceeded imports, with gold and cocoa standing first.

ALZADA COMSTOCK.

**GOLF.** With the return of many stars from the wars and the revival of most of the major tournaments, golf regained its high place on the world's sports calendar in 1946. Byron Nelson, ex-caddy who held a monopoly on the big links prizes the previous two seasons was forced by ill health to limit himself to

comparatively few tournaments with the result that a wide-open battle for his many titles was waged all year.

Ben Hogan, 135-pounder playing out of Hershey, Pennsylvania, emerged from the club swinging as the successor to his fellow Texan Nelson, leading the money winners with \$42,558. Herman Barron of White Plains, N.Y., followed with \$23,003 and Nelson was third with \$22,270. Little Ben won most of the tournaments sponsored by the Professional Golfers Association, thirteen in all, and climaxed a great campaign in the national P.G.A. test at Portland, Oregon, when he trounced Ed Oliver, 6 and 4. Listed among his other triumphs were victories in such open tournaments as the St. Petersburg, Western, Dallas, Fort Worth, Texas, Phoenix, Canadian, Golden State, and Goodall competitions.

One of the few rich plums that eluded the Mighty Mite of the fairways was the United States open, revived after a lapse of five years at the Canterbury Club in Cleveland. Lloyd Mangrum captured that event which proved one of 1946's real thrillers. Mangrum defeated Nelson and Vic Ghezzi in a play-off after each had scored 284 for the regulation 72 holes. Nelson, dogged by hard luck, missed an opportunity to win the title outright as he had the year before when a caddy accidentally kicked his ball on the thirteenth hole of the third round, costing Byron a penalty stroke.

Nelson retained a few of his crowns, including that for the Victory open at Calumet where he posted a sparkling 279 to defeat Harold McSpaden for the second straight year, Jug finishing two strokes behind the winner. However, Nelson's most pleasing triumph probably was that registered in a challenge match with Dick Burton, holdover British open champion, at the Charles River Club near Boston. The meeting, which came about when a number of persons made disparaging remarks about the sensational scoring of American pros, did not last too long, the smooth-swinging Nelson closing out the invader by 7 and 6.

Sam Snead of White Sulphur Springs, West Virginia, grabbed a share of the golfing spotlight when he went abroad to win Britain's first postwar open and return the famous trophy to America for the first time since 1933, when Denny Shute triumphed. Slammin' Sam carded a 290, two under par for St. Andrews, while Johnny Bulla, another American, tied Bobby Locke at 294 for runner-up honors. Listed among Snead's other feats were victories in open events at Miami, Jacksonville, Greensboro, and the George S. May test at Chicago. Locke kept his South Africa open championship and Henry Cotton of England triumphed in the French open.

Barron captured the All-American open at Tam o'Shanter in Chicago, winning \$10,500 with a score of 280 while George Hamer of Columbus, Georgia, paced the amateurs and Mrs. Mildred (Babe) Didrikson Zaharias of Denver led the women.

The United States amateur tournament, last held in 1941, was revived and Ted Bishop, New England champion, carried off the laurels. Bishop conquered Smiley Quick, national public links king from California, on the thirty-seventh hole of a hard-fought final on the picturesque Baltusrol course. The British amateur was annexed by James Bruen from Cork who became the first Irish golfer to win that crown when he defeated Bob Sweeney, American-born star, 4 and 3.

Mrs. Zaharias, voted woman athlete of the year in the Associated Press poll, for the second straight time, was outstanding among the feminine club

swingers, numbering among her many conquests a triumph in the national amateur in addition to that scored in the All-American. Miss Patty Berg of Minneapolis, former United States queen, took national open laurels. Miss Louise Suggs of Lithia Springs, Georgia, also ranked high, scoring impressively in the Western open and Western amateur tournaments.

Stanford captured national intercollegiate team honors with Hamer winning the individual title for Georgia. Miss Phyllis Otto of Northwestern took the women's intercollegiate laurels.

THOMAS V. HANEY.

**GRAZING SERVICE.** A branch of the U.S. Department of the Interior, which administered grazing on 142,000,000 acres of Federal Range in order to protect the lands, permit the highest use of forage and other resources, and at the same time retard soil erosion and facilitate flood control. Absorbed into the Bureau of Land Management, July 16, 1946.

**GREAT BRITAIN.** Official designation for the political union embracing England, Scotland, and Wales. Great Britain, together with Northern Ireland, the Isle of Man, and the Channel Islands, forms the United Kingdom of Great Britain and Northern Ireland. For statistical purposes the Isle of Man and the Channel Islands are included under Great Britain. Capital, London (estimated population 8,700,000). See **BRITISH EMPIRE**; **IRELAND**, **NORTHERN**.

**Population Trends.** The population of Great Britain increased from 44,937,444 in 1931 to 46,607,000 (estimated) in 1941. For England and Wales the birth rate in 1945 was 16.1 per 1,000 and the death rate 11.4 per 1,000. Infant mortality for the third quarter of 1946 represented a rate of 35 per 1,000. This was the lowest rate ever recorded for England and Wales, and was 7 below the average rate for the third quarter of the 10 preceding years. Deaths in the third quarter of 1946 represented a rate of 9.3, as compared with 9.8 per 1,000 for the third quarter of the preceding five years.

The area of Great Britain, the census population of Apr. 27, 1931, and the estimated population in 1941, are shown in the accompanying table.

GREAT BRITAIN: AREA AND POPULATION

Divisions	Area in Sq. Miles	Population *	
		1931	1941
England & ...	50,874	37,794,003	41,460,000
Wales & ...	7,466	2,158,374	
Scotland & ...	30,405	4,842,980	
Isle of Man & ...	221	49,308	
Channel Islands	75	93,205	140,000
Total & ...	89,041	44,937,444	46,607,000

\* Exclusive of army, navy, and merchant seamen abroad.

† Including Monmouthshire.

**Government.** The United Kingdom of Great Britain and Northern Ireland is a limited monarchy with an unwritten constitution, under which final legislative, judicial, and administrative authority is vested in a Parliament of two houses, acting through a cabinet drawn from its members. Parliament is the supreme legislative authority in the territories of the British Empire, excluding the self-governing Dominions.

The upper house, the House of Lords, has more than 800 members, including minors not seated. Since 1911 the power of the House of Lords in matters of legislation has been severely limited. The lower house, the House of Commons, consists of 640 members elected by universal suffrage on

the basis of one member for every 70,000 of the population.

In July, 1945, as the result of the first general election held since 1935, the wartime Coalition (largely Conservative) Government was replaced by a Labor Government with an absolute majority in the House of Commons. The standing of the Government parties in the House after this election was as follows: Labor, 393; Liberal, 10; Independent Labor, 3; Communist, 2; Irish Nationalists, 2; Common Wealth, 1; Independent, 3. The Opposition consisted of 198 Conservatives, 1 National, 13 Liberal Nationals and 1 Liberal.

Sovereign, George VI, who succeeded to the throne upon the abdication of Edward VIII on December 10, 1936, and was proclaimed King on December 12, 1936; Prime Minister, Clement R. Attlee; Secretary of State for Foreign Affairs, Ernest Bevin; leader of His Majesty's Opposition, Winston Churchill.

**Events, 1946.** The first full year of peace was a turbulent one for Britain, with domestic effort concentrated on the Labor Government's nationalization program and the drive for exports, while at the same time foreign policy was required to span such diverse necessities as the maintenance of discipline in the troubled mandate of Palestine, the provision of self-government for India, Burma, and other developing areas, and participation in international conferences at the highest levels.

Additional strain for the overworked Ministers was furnished by growing pressure from the left wing of the Labor Party to increase the degree of cooperation with Soviet Russia at the expense of working relations with the United States. The Labor Party's solid majority demonstrated its parliamentary value in all matters concerned with economic and social policy at home, while one local election after another proved that the sentiment of the voters had not altered since the party was given power in the national election. In matters of foreign policy, however, a permanent line of cleavage within the party plagued the government increasingly.

**The Nationalization of Coal.** The Labor Government elected in the summer of 1945 was pledged through the overwhelming popular acceptance of its program, "Let Us Face the Future," to the nationalization of a section of British enterprise. No part of this complicated work could be completed in the few remaining months of 1945, but the bill for the nationalization of the Bank of England laid before Parliament in October, 1945, became law on February 14, 1946, and a bill for the nationalization of the coal mines was published on December 20, 1945 (see **YEAR BOOK** for 1945, pp. 249).

For the time being, at least, little change was made in the management or operations of the Bank of England, whose reputation for skill was worldwide; but the country's backward coal mining industry presented a different problem. Years of disappointingly low production of coal and decades of unrest among the miners, accompanied always by allegations of inefficiency by workers against employers and by employers against workers, had produced a campaign for nationalization a quarter of a century before.

The coal industry nationalization bill became law on July 12, 1946. The National Coal Board, a body of nine men to whom was given the task of getting the industry back on its feet, began its work three days later. It was the duty of the board to make arrangements for the transfer of the business to the Ministry of Fuel and Power on January

1, 1947. The board initiated the establishment of eight divisional coal boards which were to be responsible for the day-to-day operations of mines in their areas, and of two consumers' coal councils, one industrial and the other domestic, which were to advise the Minister of Fuel and Power.

On August 1 the Arbitration Tribunal, a board set up to determine how the former owners should be paid, fixed the total sum at \$667,000,000. The existing operating companies were to be paid in Government stock, except for a limited number of cash payments under special conditions. Although the stock was to be inalienable at first, in order to avoid a harmful effect on the market, the plan was to provide a way for gradual liquidation by the recipients if the need arose.

The imminence of nationalization apparently had a stimulating effect upon coal production, for output in the last week of November reached the highest figure since June, 1945, and production per man was on the increase. A fuel shortage was created, however, because of the gap between output and the country's rising fuel demands. In late December some factories were obliged to close because of lack of fuel, and a five percent cut in the industrial consumption of coal was announced as effective December 30. The National Coal Board announced on December 19 that a five-day week would be introduced in the industry on May 1, 1947.

**Civil Aviation.** All civil air services except charter flying were brought under public ownership by a bill which became law at the beginning of August. This measure aroused comparatively little opposition, for public control of overseas services was already exercised by the British Overseas Airways Corporation (BOAC). The plan involved setting up three state-owned corporations: British Overseas Airways, British European Airways and British South American Airways, each of which was to operate as if it were a private corporation. The amount of compensation for the airports acquired under the act was not made known immediately, but a reliable estimate put the figure near \$80,000,000.

**Telecommunications.** The recommendations of the Commonwealth Telecommunications conference, held in the summer of 1945, that the overseas telecommunications services of all the Commonwealth governments should be brought under national ownership and that a new board with very wide functions, representing all Commonwealth governments, should be set up, were accepted by the British Labor Government. Accordingly a bill was introduced to transfer to the British Government the British overseas communications monopoly, Cable and Wireless Ltd., which had been formed in 1928 by merging nine existing telegraph companies.

The bill passed its second reading in the House of Commons in May without a record vote and was approved by the House of Lords in October. The former owners were to be paid in Government stock, but, unlike the stock paid the coal mine owners, it was to be negotiable. The day set for final transfer was January 1, 1947.

**Further Nationalization Plans.** These four fields of enterprise—the Bank of England, coal mining, civil aviation, and telecommunications—were the only ones for whom the transfer to state ownership was accomplished in 1946. It was not, however, the year's full record of activity, for plans were formulated for the nationalization of iron and steel plants and the transport services; cotton buying was centralized in Government hands, a subsidy-

price maintenance plan for agriculture was announced and arrangements were made to continue the control of foreign exchange.

**Iron and Steel Problems.** A difficult technical and political situation was presented by the iron and steel industry, sections of which the Labor Government early scheduled for nationalization. The industry offered a sharp contrast with coal mining. Production was satisfactory; its need of modernization, though apparent, was not critical; and it had an excellent record in labor relations. Its industrial structure was far more complicated than that of coal mining. In climax, when the Government's plans were announced they brought the further complication of proposed nationalization of only part of the enterprises.

Iron and steel producers had for some time been organized in an established federation. This group, aware of its own need of improvement and of the Government's plans, itself offered the Government, in December, 1945, a modernization plan to cost approximately \$675,000,000. This plan was published as a Government *White Paper* in May, 1946. The Government, however, proceeded to set in motion nationalization plans which it had announced in April. On May 29 the House of Commons concluded a two-day debate on the question and approved the Government's plan by a vote of 338 to 184. No date for nationalization was set, but the Government proposed to set up a control board to see that the industry was carried on and that modernization schemes proceeded swiftly and smoothly.

There was some difficulty in persuading steel manufacturers to serve on the board, for they said that they could not conscientiously work towards nationalization. After assurances by the Minister of Supply, John Wilmot, that their work would not be directly concerned with nationalization, the Government was able to announce the composition of a tripartite board headed by Sir Archibald Forbes, formerly a manufacturer and subsequently a Government official. At the end of the year plans for the iron and steel industry were still far from complete.

**Nationalization of Transport.** The Government's bill to bring railways, road transport, canals, docks and harbors under national control was presented to the House of Commons on November 28. This was by far the most ambitious of the nationalization plans, involving as it did some 1,500,000 employees and businesses worth at current prices about \$24,000,000,000. Justification of the plan was asked for repeatedly, for the four great railway systems involved, the Great Western, the London, Midland and Scottish, the London and North Eastern and the Southern, had in some quarters an enviable reputation for efficiency.

The plan was to set up a British Transport Commission of five members and to transfer the system to the new authority in January 1, 1948. The contemplated financial arrangements were promptly criticized, for the stockholders were to have no right of appeal other than to Parliament, and the basis of compensation, which was not agreed upon in advance, was regarded by financial interests as inequitable.

The four main line railway companies issued a statement on December 11, criticizing the terms of the bill. The British Railway Stockholders' Union opened a campaign against nationalization at a meeting on December 13. On December 15 the Central Committee of Transport Users, representing the Association of British Chambers of Commerce, the Federation of British Industries, the

National Union of Manufacturers, the Traders' Coordinating Committee on Transport and the Traders' Road Transport Association, urged the Government to arrange for public inquiry "before the country was committed irrevocably."

The House of Commons debate on the second reading of the Transport Bill occupied three days, December 16-18. Minister of Transport Barnes, making the second reading, described the bill as the largest and most extensive socialization measure ever presented to a democratic parliament. He rejected the demands for an inquiry but said that he would welcome constructive criticism or advice. When the opposition motion for the rejection of the bill was voted down by 362 to 204, critics took satisfaction in the fact that it was the first time in that Parliament that the opposition had recorded a vote of more than 200.

**Powers over Agriculture.** The text of an agriculture bill conferring wide powers on the Government over farm land and farmers, and guaranteeing stable prices in return, was given to the House of Commons on December 19 by Minister of Agriculture Tom Williams. An explanatory memorandum, issued as a *White Paper*, stated that the Government's policy was to promote a stable and efficient agriculture capable of producing such part of the nation's food as in the national interest it was desirable to produce in the United Kingdom. It was pointed out that home agricultural production rose from £290,000,000 to nearly £580,000,000 during the war.

The bill provided that guaranteed prices and assured markets would apply to fat cattle, fat sheep, fat pigs, cows, milk, wheat, barley, oats, rye, potatoes and sugar beets. A controversial feature of the bill was the Government's reservation of the right to dispossess farmers by the compulsory purchase of their land if they failed to meet their responsibilities and to comply with the advice given them by Government agencies.

The bill was the outcome of practices and consultations extending back through the war years. In principle, the measure was to a considerable extent agreed upon before it started on its parliamentary course, and its passage appeared to be assured.

These two plans for further public activity, transport nationalization and farming control, were mentioned in the King's speech at the opening of Parliament on November 12. The coming nationalization of electricity, so that all fuel and power could be coordinated, was also mentioned in the speech, as well as the plan for continuing wartime control over foreign exchange which appeared as a bill in Parliament soon after the opening. Government buying of cotton, eliminating Liverpool as the world's raw cotton market, received Parliamentary approval in December.

**Non-Socialized Industry.** The sector of British industry not scheduled for nationalization was given advice and the promise of assistance, beginning with industries whose improvement was essential to national prosperity, through the device of the "working party." This program was outlined by Sir Stafford Cripps, President of the Board of Trade, in statements on October 15, 1945, and March 11, 1946, when he announced the establishment of tripartite working parties (i.e., committees composed of representatives of employers, trade unions and independent members selected by the Government) for 15 industries.

The Working Party Report for the cotton manufacturing industry, a business always of prime concern to the British people, was issued in May, 1946. The main recommendations of the report

were that a comprehensive survey should be undertaken immediately of existing industrial plant and its suitability for modernization; mills should work in groups, immobilizing a portion of existing spindles and setting up a fund, drawn from a levy, to aid re-equipment; marketing and research should be pushed and loan facilities for modernization and consolidation should be provided.

The Government policy with respect to cotton, announced on December 3, was linked to the recommendations of the working party. The Government offered to make a free contribution to the cotton spinning industry covering one-fourth of the cost of all essential machinery re-equipment, on the condition that the reorganization take place quickly, that the mills group themselves and that the two-shift system be introduced when the plants were modernized. This announcement gave a clear indication that working policy reports for other industries would be followed by positive action on the part of the Government.

**Labor and Social Services.** The Labor Government considered that in the field of the social services the recommendations of the Beveridge Report, published and endorsed by the Coalition Government in 1943, had been carried into law at all its main points, and in some respects even was exceeded by legislation already on the statute books at the end of 1946.

Under the National Insurance Act, finally passed in August, 1946, every one in Britain was given social security "from the cradle to the grave," in the words of the Beveridge Report. This was done by means of compulsory insurance with payments into funds to which employers, employees, and the State contribute. The earlier elaborate machinery was altered so that the ordinary contributor would now pay only a single weekly contribution.

Allowances for children starting with the second child, as provided under a bill passed in May, 1945, were begun in the summer of 1946. In this instance the cost is met by the Treasury. Under the National Health Service Act which became law on November 6, 1946, complete medical, dental, specialist, and hospital services became available without charge to everyone, although the choice of doctors by patients and the choice of activity by doctors was retained. Some members of the British Medical Association continued to oppose the measure after its passage, and to threaten to withhold their cooperation.

**The Export Problem.** The kernel of British Labor Government policy has been and remains full employment. Several of its domestic state control measures which are not immediately explicable on grounds of easy provability of the greater efficiency of Government operation, are more easily understood against this background. Measures taken in 1946 to promote exports, however, were directed not only towards maintaining employment but also towards maintaining the standard of consumption of the nation and its people, and therefore no important differences of political opinion or social policy were in question.

Because of her wartime sacrifices in investments abroad, shipping services available to other countries, and altered home production, Britain's visible and invisible exports in 1946 were not sufficient to enable her to pay her way, even though imports were forcibly kept below the prewar level. By the third quarter of 1946 visible exports were only 104 percent of prewar volume, in spite of the announced necessity of raising them to 175 percent of the earlier amount. Imports were held down in

the same period to 70 percent of the 1938 volume, leaving Britain still the world's greatest importer and at the same time an example of a reduced standard of living.

Rationing and scarcities remained in force while productive energy was forced into goods for export. Most of these goods were not made available for purchase at home. An exhibition of export goods in the autumn, called "Britain Can Make It!" produced the popular slogan "Britain can make it, but Britain can't get it," as well as large numbers of the foreign orders hoped for.

The American and Canadian loans, which were intended to tide over this reconversion period in Britain, were used sparingly for a number of reasons. Rising prices in the United States were a deterrent to the full utilization of the \$3,750,000,000 granted, although in the first seven months of 1946 the largest supplier of the United Kingdom was the United States. Shortages of materials and lack of shipping affected purchases from Canada's \$1,250,000,000 loan, but Canada held second place as a source of Britain's carefully restricted imports.

At the end of the year the figures showed that British exports in 1946 were nearly double in money value those of 1938, although the volume was about the same. Several disturbing trends were apparent. Shortages of coal, steel and other materials were becoming more serious. The increase seemed to have slowed after the middle of the year. Future foreign purchasing power was problematical because of the fact that although one-half of Britain's imports were coming from the hard-currency dollar areas of North and South America, only one-seventh of her exports were going there.

Commenting on this problem, *The Economist* (London), remarked as follows in its summary, "Britain's Balance of Payments," on December 21, 1946.

This visible deficit is not a full measure of the extent of the dollar outgoings, because a substantial part of the government expenditure, especially in Germany, is incurred in dollars, and because Britain's dollar reserve has to meet the whole dollar needs of the sterling area. Yet on the basis of current dollar prices, the purchasing power of the American loan, as Mr Dalton [Chancellor of the Exchequer] estimated this week, has been reduced by, say, 23 percent.

... It would be folly to count on any perceptible relief from such progress during the critical two years or so for which the dollar credits will hold out. The Government, for the present at least, has evidently decided not to attempt any specific directional control of exports, although it will license raw material supplies to exert pressure in the appropriate directions. . . . But if direct action must be ruled out, the Government dare not sit back and simply watch Britain's external finances drift steadily towards the rapids of 1949 and 1950. The only possible course seems to be a sustained campaign of exhortation and education, combined with vigorous official exploration of export opportunities in all cases in which private market research looks inadequate.

**Foreign Affairs.** Foreign Secretary Ernest Bevin was several times called upon to explain and defend British foreign policy in the House of Commons. On February 21, after a debate in which Anthony Eden, Foreign Secretary under the wartime Coalition Government, expressed anxiety over the international situation in general and Anglo-Soviet relations in particular, Bevin did much to allay any uneasiness generally felt. He revealed that he had offered to advise the British Government to extend the duration of the Anglo-Soviet treaty from 20 to 50 years and to amend the treaty in any way that would foster confidence. He also announced that he had invited the prime ministers of the Dominions to meet in London before the Paris Peace Conference.

Opening a two-day debate on foreign affairs on June 4, Bevin spoke of the coming Paris Peace Conference and his disappointment in Russia's attitude on some of the problems involved. On July 26 the Foreign Secretary was called upon to defend in the House the Foreign Ministers' decision that Italy should be allowed to retain South Tirol.

In another two-day debate in the House of Commons on October 22-23, Bevin made a restrained and tactful reply to criticisms which were in effect aimed at his position in the course of the Paris Peace Conference. "We are not ganging up with anybody, either with one side or the other," he said. He outlined the plan for Germany that he would take to the Council of Foreign Ministers' meeting in New York, one that closely resembled that of Secretary of State Byrnes, and observed that "we must either have the Potsdam Agreement observed as a whole . . . or else have a new agreement."

**Labor Revolt in Commons.** The severest test of support of Bevin's foreign policy came soon after Parliament opened on November 12, while the Foreign Secretary was in New York for the meeting of the Council of Foreign Ministers. The affair began when 59 members of Parliament signed an amendment to the opening speech of King George VI, urging that the Government review and recast its conduct of international affairs, in order to collaborate with nations using full Socialist planning and to "provide a democratic and constructive Socialist alternative to an otherwise inevitable conflict between American capitalism and Soviet communism in which all hope of world government would be destroyed."

After a lively debate, including attacks on the Foreign Secretary which drew forth expressions of resentment from Prime Minister Attlee, the foreign policy amendment offered by the rebel labor members was lost on November 18 by a vote of 353 to 0. The gravity of the revolt was shown by the number of abstentions. The number of Labor members unaccounted for was 122, and it was known that 60 or 70 of them were in the chamber and deliberately abstained from voting.

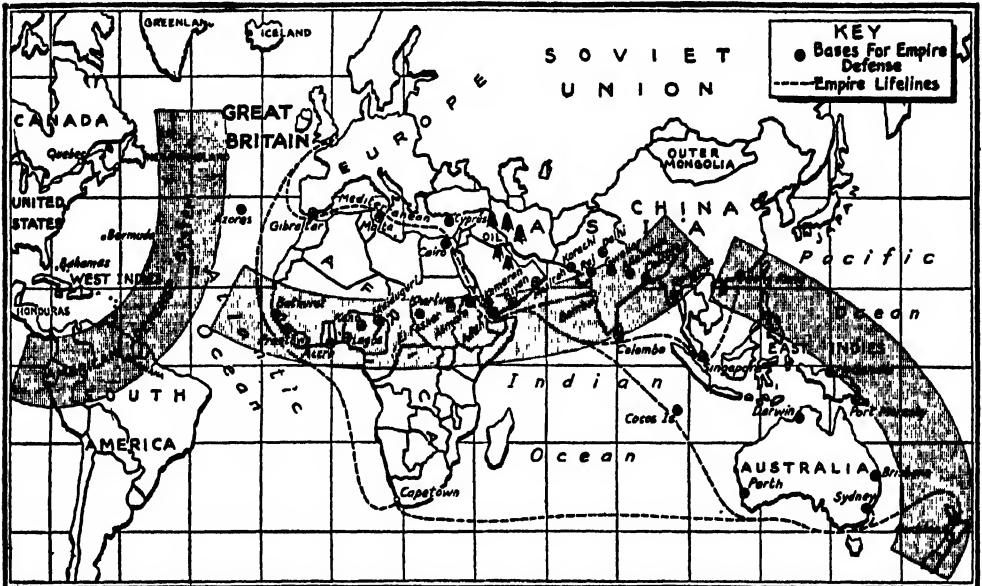

**Council of Foreign Ministers.** Bevin attended the meetings of the Council of Foreign Ministers held in the course of the year. He was not able to be at the opening of the Paris Peace Conference, because of physicians' orders to rest after the June-July meeting of the Foreign Ministers, but he took an active part after his arrival. The frequent clashes between Bevin and the Soviet representatives at Paris was one of the causes of the Labor revolt in the House of Commons in November, but in other quarters there were varying explanations of the origins of the provocation evident at the Peace Conference.

When the Foreign Secretary came to New York in early November for the meeting of the Council of Foreign Ministers held while the General Assembly of the United Nations was meeting in Flushing, he was given a civic reception. Later he was entertained by leaders of the American Federation of Labor. On December 8 he had an interview with President Truman in Washington. When the Council ended its meetings on December 12, with plans to reconvene in Moscow on March 10, it was evident that relations among the members of the Big Four were cordial.

**Difficulties Abroad.** The year was full of problems in the foreign field, aside from those which directly occupied the Council of Foreign Ministers and the British delegation to the General Assembly of the United Nations. The presence of British troops

in Greece and other British activity in relation to that country remained a bone of international contention. Britain was unable to come to a definite agreement on the question of the Anglo-Egyptian Sudan condominium, but British troops were withdrawn from Egypt, where they had been quartered since 1882.

British mandated territories in Africa (the Cameroons, Tanganyika and Togoland), were announced as scheduled for United Nations trusteeship by Foreign Secretary Bevin before the General Assembly of the United Nations in London on January 17. At the same time he said that the mandated country of Trans-Jordan would be made a

#### SHADED ARCS SHOW APPROXIMATE LINE OF GREAT BRITAIN'S DEFENSES

On April 4 the British Government announced that because of the unfriendly attitude of the Albanian Government the British minister designate would not be sent to Tirana. Relations between the two countries deteriorated in the remainder of the year. On December 9 it was announced that the British Government, after a thorough examination of the evidence that had accumulated after two British destroyers were mined in the Corfu Channel on October 22, had sent a note to the Albanian Government by way of Belgrade.

**Empire Developments.** Within the Empire also there were areas of turbulence, although distinct progress towards self-government could be seen in certain territories. India was too much torn by communal differences to make rapid progress towards the self-government urged upon it by the British Government. In Burma and Malaya the situation was internally different, but sufficiently disturbed to cause delay and alteration of plans. (See articles on INDIA, BURMA, BRITISH MALAYA.) In the Palestine mandate the continuance of violence caused increasing apprehension in the world at large. (See article on PALESTINE.)

**Colonies and Mandates.** Grants from the Colonial Development and Welfare Fund continued to be made, and at the beginning of October the appointment of the members of the new Colonial Development Council was announced. The Government policy in general was outlined in the House of Commons on July 9, when George Hall, Colonial Secretary, defined it as the development of the colonies and all their resources to enable their peoples to improve their economic and social conditions and, as soon as might be practicable, to attain responsible self-government.

sovereign, independent state, but that the British Government's plans for mandated Palestine must await the report of the Anglo-American Commission of Inquiry.

A White Paper on the British proposal to place the Cameroons, Tanganyika and Togoland under the international trusteeship system established by the United Nations Charter was published in London on June 24. After discussion with the United States, which objected to clauses allowing Britain to establish fiscal or other monopolies in trustee territories, and after consideration by the General Assembly of the United Nations in New York, the trusteeship arrangements were approved by a vote of 41 to 5 on December 13.

**Commonwealth Consultations.** The Foreign Ministers of the Dominions met in London in April, with many items on the agenda connected with joint defense. This meeting was followed by a conference of Dominion Prime Ministers, which was concluded in May. The official announcement from 10 Downing Street on the work of the Prime Ministers' conference, issued on May 23, was general in character, but it indicated that the Paris peace treaties, liaison on defense matters and economic and welfare cooperation in the South Pacific and Southeast Asia were included in the more important subjects discussed.

Less formal discussions were held in London in October, as the delegates of 18 nations were gathering for the preparatory conference on world trade and employment. British trade and financial experts and delegations representing the Dominion Governments discovered a striking unanimity of determination that the future economic pattern of the world should not be a repetition of what it was

after 1914–1918, according to Sir Stafford Cripps, President of the British Board of Trade, who summarized the talks.

**British-American Relations.** The most important agreement reached by the British and American Governments in 1946 was that for economic fusion of the British and American zones of occupation in Germany, signed on December 2 by Foreign Secretary Bevin and Secretary of State Byrnes. The decision was made under that portion of the Potsdam Agreement that stated that "during the period of occupation Germany shall be treated as a single economic unit." Russia and France were included in the original invitation issued by Secretary Byrnes but neither responded positively.

A joint Anglo-American statement issued on January 14 gave policy recommendations affecting the economic development of the Caribbean, including plans for expanding food and livestock production in order to make the islands more nearly self-supporting. The policy statement reviewed the recommendations of the West Indian conference held in Barbados in 1945 under the auspices of the Anglo-American Caribbean Commission, and anticipated a conference held in St. Thomas in the Virgin Islands in February.

At the Bermuda Civil Aviation conference in Hamilton in January and February agreement was reached on Anglo-American commercial use of nine military air fields built during the war by the United States in British possessions in the North Atlantic and Caribbean. After four weeks of negotiation an Anglo-American air agreement was signed on February 11.

**Cabinet Changes.** Prime Minister Attlee made the first change in his ten-months old cabinet when on May 27 he appointed John Strachey as Minister of Food to succeed Sir Ben Smith. Later in the year, with the issuance of the October 4 White Paper proposing the formation of a Ministry of Defence, A. V. Alexander was selected as Minister of Defence and new heads were appointed for all the service departments. The service ministers were no longer to be cabinet members. New appointments were announced as follows on October 4: Minister without Portfolio, A. V. Alexander; Secretary of State for the Colonies, A. Creech Jones; First Lord of the Admiralty, George H. Hall; Secretary of State for Air, Philip Noel-Baker; Secretary of State for War, F. J. Bellenger; Minister of Civil Aviation, Lord Nathan; Minister of State, Hector McNeil.

**Demobilization and Austerity.** Demobilization was well advanced in 1946, although service in the occupied countries kept the numbers of men under arms from becoming small. Peace time conscription was approved by Parliament with some Labor members abstaining. It was not possible to release any items from the rationing scheme, and bread was added for the first time. Nevertheless at the end of the year some improvement was observable in the commodities available. Coal and raw materials were short, however, the former to the point of hardship for consumers as well as for industry.

**Religion and Education.** The Church of England, with a Protestant Episcopal form of Government, and the Church of Scotland (Presbyterian), are the established churches of the respective countries. In Wales the Church was disestablished in 1920. The leading denominations in England and Wales according to membership are the Anglican, Roman Catholic, Methodist, Congregationalist, Baptist, and Calvinist Methodist.

Elementary education is provided free throughout Great Britain, and under the heading of "ele-

mentary education" are included large numbers of senior and central schools providing education of a secondary grade. The Education Act of 1944, not yet fully in effect, classified public education into primary, secondary and further education. Free full-time schooling is to be carried through the secondary stage, which begins at about the age of 11. The Education Act of 1944 raised the school-leaving age to 15 immediately, and to 16 as soon as enough schools were built. Children leaving school at 16 are to attend special County Colleges several days a week in their employers' time. In Scotland all forms of post-primary education up to 18 are provided free, except in a few schools. The "public" (endowed) schools of England are outside of the state system.

There are 11 universities in England, 4 in Scotland and 1 in Wales. The number of students enrolled in 1945–46 was 50,178. In normal times about two-fifths of the students are assisted by the state.

**Production.** Although only a small fraction of its population live on the land, Britain has rich agricultural areas capable of producing a variety of crops. The chief agricultural products are wheat, barley, oats, beans, peas, potatoes, turnips, swedes, mangold and hay. Beef, mutton, pork and dairy products are also important. In the course of the war, agricultural production was increased until it supplied two-thirds to three-fourths of home needs as compared with one-third before the war.

Great Britain's reliance is mainly upon manufacturing, although before it became a depressed business coal mining also furnished a profitable article of export. Provisional figures for the coal industry for 1946 showed coal output of 189,300,000 tons, as compared with 182,772,700 tons in 1945. In peace time the chief industries were textiles, iron and steel, engineering and shipbuilding. Steel production in November, 1946, was at a record peak of a rate of 13,700,000 tons a year, compared with 10,400,000 in 1938. The working population at the end of September, 1946, was 20,402,000, a figure larger than that of mid-1939 by 652,000. At that date the flow of women out of industry appeared to have been checked.

**Trade.** The chief imports of the United Kingdom are food, drink and tobacco and raw materials. The leading exports in 1946 were vehicles, machinery, iron and steel manufactures, chemicals and cotton and wool products. Commodity exports were only about three-fourths as large as commodity imports. Taking invisible items into account, the trade deficit in 1946 was estimated at £450,000,000 or more.

ALZADA COMSTOCK.

**GREECE.** A Balkan state, occupied by Axis troops from April-May, 1941, until October, 1944. Capital, Athens. Greece has an area of 50,147 square miles (mainland, 41,328; island, 8,819). The population was estimated at 7,200,000 in 1941 (7,336,000 at 1940 census). Estimated populations of the chief cities in 1939 were: Athens, 392,781; Piraeus, 198,771; Salonika (Thessalonike), 236,524; Patras, 61,278; Kavalla, 49,980; Canca, 26,608; Corfu (Kerkyra), 32,221.

**Religion and Education.** School attendance in 1937–38 was: Elementary, 985,018; secondary, 92,687; university, 7,998. The 1928 census returns showed 5,961,529 members of the Greek Orthodox Church, 126,017 Moslems, 72,791 Jews, 35,182 Roman Catholics, and 9,003 Protestants.

**Government.** Premier John Metaxas administered Greece as a dictatorship from Aug. 4, 1936, until his death on Jan. 29, 1941. The government re-

maintained a monarchy in form under King George II, who had been restored to the throne Nov. 25, 1935, in accordance with a plebiscite, to rule under the Constitution of 1911. King George signed the 1936 decrees which suspended constitutional guarantees, dissolved Parliament, abolished political parties, and imposed strict control over the press and other means of communication. Thereafter, all legislation was enacted by royal decree.

According to a resolution passed by the Greek National Assembly Oct. 10, 1935, the 1911 Constitution was to remain in force until the enactment of a new Constitutional Charter. King George on Oct. 22, 1941, issued a royal decree regulating the functions of state authorities in cases in which the 1911 Constitution could not be fully applied owing to the absence of the Government from Greece.

Italian forces invaded Greece Oct. 28, 1940, and were driven out by the Greek Army, which advanced and occupied one-third of Albania by Apr. 6, 1941, when the German invasion of Greece began. The Greek armed forces were defeated and a British expeditionary force was expelled. King George, with members of the Government, left Athens April 22 and, after a temporary stay in Cairo, Egypt, was transferred to London, effective Sept. 22, 1941.

Axis forces were in control of Greece until 1944 when political and military events forced German and Bulgarian armed forces to leave and the whole country was cleared by Oct. 15, 1944. The Greek Prime Minister, M. Papandreou, arrived in Athens on Oct. 18, 1944. King George, on Dec. 30, 1944, set up a Regency to last during the period of emergency and until the will of the people should be known as to whether they desired a monarchy or a republic. Regent in 1945: Archbishop Damaskinos (sworn in, Dec. 31, 1944). Prime Minister in 1946: Constantine Tsaldaris (selected April 18, 1946).

**Events.** Greece entered 1946 under the virtually one-party Government of Themistokles Sofoulis, venerable leader of the Liberal Party, whom the British had installed in power in November 1945. The royalist Popular Party had refused from the start to participate in a Government in which it did not hold at least equal power. The left wing EAM coalition had given its support on the Liberal Party's pledge that it would suppress Rightist terror in a matter of weeks, so that fair elections might be held. EAM withdrew its support when security conditions seemed to deteriorate instead of improve. On January 20, for example, rightists in force attacked a number of leftists in the town square of Kalamata, and the Left charged that Government officials had connived in the attack. Subsequently Sofoulis declared that the British Military Mission had made improvement impossible by blocking all his Government's efforts to remove dangerous Rightists from the General Staff and other key positions.

The situation was further exacerbated by economic crisis. At the beginning of the year the gold sovereign reached 181,000 drachmas, and the cost of living index was approximately fifty times the October 1940 base. Strikes were frequent. The Right pressed for immediate elections, as the only remedy for chaos, and urged that the simple majority instead of the proportionate system be used, so that one party might have decisive strength to carry business through in the Chamber. Three ex-Prime Ministers, all right of Center, joined the Popular Party in a Rightist coalition; these were Sofokles Venizelos, George Papandreou, and Panayotis Kanellopoulos. The Government stuck by

its decision to hold elections on March 31, and, despite efforts of the Regent Archbishop Damaskinos and others on behalf of the majority system, declared the proportionate representation system would be used.

A crisis was precipitated when on January 21 the Soviet delegate to the Security Council of the United Nations meeting in London asked that the British withdraw their troops from Greece. Foreign Minister John Sofianopoulos, the Greek representative, refused to speak on the issue on the grounds that Greece wished to maintain cordial relations with all its allies, and that it did not become a minister in a Government installed by the British to speak on behalf of the British. Sofoulis declared that the British forces were present in Greece on the invitation of the Greek Government. Sofianopoulos was dismissed even before he reached Athens, and replaced by the more conservative Constantine Rendis. The Russian petition was voted down. In Athens anti-British feeling mounted, not only on the part of the Left, which charged that the British enforced reaction, but in many sections of the Right, on the grounds that the spectacular financial benefits which had been expected as the reward for submitting to British counsel were not forthcoming. On February 11 Ambassador Sir Reginald Leeper and Lt. Gen. Sir Ronald Scobie were replaced by Ambassador Sir Clifford John Norton and Major General Kenneth Crawford. Excitement seethed over the question of postponing the elections. In this agitation Sofianopoulos and Alexander Svolos, the Socialist leader, cooperated with EAM in a campaign to induce the electorate to abstain from voting. Some ten ministers of Sofoulis' swollen cabinet resigned. Sofoulis himself acknowledged that the lists were greatly padded and obsolete and that intimidation by the Right would make a fair election impossible. He said he wished to postpone the elections but had been prevented by British insistence. In an election speech at Saloniki at the end of March he charged that members of his party had been prevented from moving about freely for electioneering purposes. On the other hand the subsequent Report of the Allied (British, American, French—the Russians refused to participate) Mission for Observing the Greek Elections (AMFOGE I), which had been making sampling and other studies for three months before the election, declared that the results fairly represented the will of the electorate and that no intimidation had been used. The Report estimated purposeful abstentions at less than 15 percent of the registration.

In the election of March 31 the Popular Party won a majority of the seats in the Chamber. Panayotis Poulitis was made Prime Minister and other than Popular Party members of the Rightist coalition were given ministries. But on April 18 the Popular Party assumed all the Ministries, the principal portfolios going to the "Big Four" of the Party: Constantine Tsaldaris, Prime Minister and Foreign Minister; Petros Mavromikhalis, Ministries of War, Navy, and Air; John Theotokis, Minister of Interior (his son Spyros, Minister of Security); and Stefan Stefanopoulos, Minister of Coordination. Non-Popular Party Rightists withdrew from the coalition, alleging high-handedness on the part of the Popular Party leadership, especially in the matter of promoting the restoration of the King.

The Popular Party had based its campaign on the argument that it alone could assert Greece's national rights, especially on the northern frontiers, insisting that democracy would be the vestibule to communism and hence to the enslavement of

Greece by its Slavic neighbors. The Left advocated friendly relations with Greece's northern neighbors and charged that the Rightist agitation against Albania, Bulgaria, and Yugoslavia was calculated to distract attention from pressing internal problems, to justify repressive measures against internal opposition, and finally to precipitate war which would assure their tenure of office and permit perpetuation of their reactionary policies. The Government charged that "autonomist" bands based on Bulgaria and receiving support from Communists within Greece were working for the detachment of Greek Macedonia from Greece for eventual incorporation in a Slavic Balkan Federation. The Left declared that the reports of autonomist activity were much exaggerated and that such activity as there was, was the work of Government and British agents provocateurs. In June the Government made the Communist danger the basis for severe restrictive measures, suspending the articles of the Constitution which guaranteed the security of the individual. Search and seizure might be carried out at all times and without warrant, sentences of drum-head courts might not be appealed but must be executed at once, and those "morally responsible" for crimes were declared equally guilty with perpetrators. Trade union premisses were raided and leaders put under arrest, and labor organizations were put under the control of the Ministry of Labor. Hundreds of persons were exiled to the islands, including the respected ELAS Generals Surafis and Bakirdjis. The armed services were purged of republican elements, and came directly under control of Petros Mavromikhalis, Minister of War, Navy, and Air. Twenty-seven republican (but anti-Communist) generals were retired. The new police chief of Athens was a man who had served under Maniades, the chief of Metaxas' security services; his predecessor, Angelos Evert, who had been police chief under Metaxas and during the occupation, was made a permanent official in the Ministry of Security. In the economic field, restrictions on labor relations and prices of which industrialists had complained were removed. To maintain confidence in the drachma, the Government authorized the sale of gold sovereigns from the national reserves at the rate of 136,000 drachmas; but the budget remaining unbalanced, the Government continued to print drachmas, and it seemed that wild inflation would recur when the sale of gold was stopped, as it eventually must be. The temper of the Government is illustrated by a statement made in the Chamber in May that John Rallis, the last quishing Prime Minister, deserved a public monument for his services; when Rallis died in prison at the end of October Popular Party officials provided a sumptuous funeral.

Relations with Russia and its protégés deteriorated. The Russian Ambassador, Admiral Rodianov, whose arrival in December 1945 had been interpreted as a mark of confidence in a Government of which Sofianopoulos was Foreign Minister, rejected the results of the election and left Athens. Bulgarian hostility was aroused by the charges that it connived in the Macedonian autonomist activity, and more by the Greek claims of Bulgarian territory embodied in a memorandum to the Foreign Ministers meeting in Paris on April 25. Bulgaria defended itself by warm counter-charges. The Governor General of Western Macedonia charged that Yugoslavia was waging undeclared war against Greece, and evoked formal protest from Yugoslavia. Agitation was most intense concerning the claims on Northern Epirus-Southern Albania. In July and October there were charges and counter-charges of

violation of sovereign territory. The Greek claims aroused a measure of support in the United States, where the Senate passed a resolution approving them. The Foreign Ministers in Paris rejected the claims upon Bulgaria, but voted unanimously to grant the Dodecanese Islands to Greece (June 28, 1946). In Greece as in Cyprus there was agitation for that island to be transferred to Greece. Claims for Turkish Thrace were voiced only by Leftist spokesmen.

Meanwhile the Government pressed for an early plebiscite on the regime question, declaring that only settlement of the question could bring quiet and that only the King could present Greece's national claims convincingly. The opposition, now joined by Venizelos, Papandreou, and Kanellopoulos, pleaded for postponement. An agreement had been made when Sofoulis assumed the premiership that the plebiscite would not be held until 1948; furthermore the AMFOGE report had stated that whereas the opportunities for fraud presented by the inaccuracy of the electoral lists had not been exploited in the March 31 elections, those lists should be thoroughly revised on the basis of a new census before the opinion of the Greek people was again sought on a matter of national import. The British Ambassador agreed to September 1, 1946, the date proposed by the Government, as a means to restoring calm to the country. A smaller Allied Mission (AMFOGE II) comprising only British and Americans, the French having refused to participate, was sent to observe the plebiscite. Doubts as to the genuineness of the plebiscite were widespread, even among moderates. It was pointed out that John Theotokis, whose Ministry of Interior was responsible for conducting the polling, had helped engineer the notoriously rigged plebiscite which had recalled the King in 1935. There was no organized campaign for abstention, and a surprisingly large proportion of the registration voted. Almost two-thirds of the votes were for the return of the King, and AMFOGE II approved the balloting as genuine. A few days after the election the United States aircraft carrier Franklin Roosevelt together with a cruiser and three destroyers called at the Piraeus, and planes from the carrier formed the letters FDR over the skies of Athens. In Greece the gesture was interpreted as indicating American approval of the monarchy, and was accordingly praised by the Right and criticized by the Left.

The King returned to Greece in a British plane on September 28, his entry to the capital from the airport being very heavily guarded. After the plebiscite security conditions deteriorated sharply, and Acting Prime Minister Stylianos Gonatas issued decrees virtually establishing martial law. The Athens police occupied Communist Party headquarters. Increasing numbers of Leftists went to the hills, especially in Thessaly, and Government measures against these bands soon assumed the proportions of a regular war, in which aircraft and tanks were employed. The Government resigned upon the advent of the King, but was immediately reinstated, and resisted efforts, in which leading members of its own Party as well as of the opposition joined, to broaden its base. This pressure, combined with financial scandals in which high Government officials were involved, did produce a shakeup on November 4, by which Petros Mavromikhalis, Spyros Theotokis, and Antonios Stratos (Minister of Labor) were eliminated; but Tsaldaris retained the premiership and the portfolio of Foreign Affairs, and the complexion of the Government continued virtually exclusively Populist.

By the end of November guerrilla operations of

Leftist bands had removed large areas in Northern Greece from Government control, and there were disturbances even in the predominantly royalist Peloponnese. The Government charged that leaders for these bands were being trained in Yugoslavia, and that the bands were being supplied from Albania and Bulgaria as well as Yugoslavia. These countries denied the charges, and on November 25 *Borba*, the organ of the Communist Party in Belgrade, spoke of severing diplomatic relations with Greece. In Athens the centrist *Eleftheria* was reprimanded by the Government for publishing a communiqué of the rebel forces. Leftist spokesmen in Greece denied that arms were being received from abroad and declared that they were being supplied from Greek army sources which were hostile to the Government and to the British. Their assertions seemed to be substantiated at least in part by Government reports of numerous executions of regular army and gendarmerie personnel for treason. On December 6 Prime Minister Tsaldaris arrived in the United States to press his Government's charges that Greece's Russian dominated northern neighbors were providing guidance and material aid to revolutionary elements in Greece.

**Production.** Previous to the war about 54 per cent of the working population was supported by agriculture and fishing, 20 percent by industry, and 8 percent by commerce. The country was dependent upon imports for more than 25 percent of its total food consumption and for 40 percent of the wheat consumed. Wheat production declined from the prewar average of 700,000 metric tons to estimated 393,500 tons (this is exclusive of the output of Thrace and Eastern Macedonia in 1945. Estimated yields of other crops in 1945, except as stated, were (in metric tons): tobacco (1940), 48,900; currants, 35,000; raisins, 15,000; figs (exportable crop), 39,600; barley, 75,200; oats, 53,800; rye, 24,400; olive oil, 80,000 tons in 1942-43.

Factory production in 1938 (excluding wine, olive oil, and wheat products) was valued at 13,552,000,000 drachmas. Mineral output included iron ore, pyrites, lignite, manganese, lead, zinc, chrome, and nickel-cobalt.

**Foreign Trade.** In 1941, imports were valued at 4,840,000,000 drachmas (12,215,326,000 in 1940) and exports 3,904,000,000 drachmas (9,079,380,000 in 1940). Chief sources of 1941 imports (millions of drachmas): U.S.S.R., 673; Germany, 544; United Kingdom, 354; others, 3,269. Distribution of exports (in millions): Germany, 1,825; U.S.A., 904; United Kingdom, 486; Italy, 141; others, 548.

**Finance.** In 1941-42 revenue amounted to 16,500,000,000 drachmas; expenditure, exclusive of occupation costs, 30,300,000,000 drachmas (this includes the amounts of interest due on foreign debts but not paid). Estimates of the cost of Axis occupation levied on Greece varied from 18 to 180 billion drachmas annually, the latter figure included credits extended to the Axis countries by the puppet regime in Athens. Notes in circulation on November 30, 1946, amounted to 468,000 million drachmas.

**Transportation.** In 1940 Greece had approximately 1,864 miles of railways, 8,440 miles of highways, air connections from Athens to most of the principal European cities, and a merchant fleet of some 607 vessels (of 100 tons or over) aggregating about 1,780,700 gross tons. Much of the transportation and communication network was disrupted or destroyed by the Italo-German invasions of 1940-41. Half the merchant marine was destroyed or captured during the same period.

MOSES HADAS.

**GREENLAND.** A large island in northeast North America. It is a possession of Denmark (see below under *Government*). Area: 736,518 square miles. Population (1943): 20,163 natives and 500 Danes. The main settlements are Julianehaab, Godthaab (capital), Sukkertoppen, Kuttligssat, Godhavn, and Angmagssalik. The natives speak an Eskimo dialect, while the Europeans speak Danish. Educational facilities include grade schools, high schools, and a training school for teachers. Practically all the inhabitants profess the Lutheran faith.

**Production.** Cod fishing is the mainstay of Greenland's economy. A total of 7,945 metric tons of cod was produced for salting in 1944. Agriculture is limited to sheep raising in the southernmost part of the west coast. The important minerals produced are cryolite (40,000 tons, 1944) and coal. Marble has been quarried and other minerals are known to exist. Trade during normal times is a monopoly of the Danish Government. During peacetime all exports are sent to Denmark (except for a portion of the cryolite output) and all imports are shipped from Denmark.

**Foreign Trade.** During World War II communications with Denmark were cut off and foreign trade was with the United States, Canada, and Portugal. Of the total imports in 1944, the United States supplied 52 percent, Canada 38 percent, and Portugal 10 percent. Imports and exports are mainly consumers' goods. There are no customs duties or other import formalities, but the commercial importation of commodities by private firms or individuals is prohibited.

**Government.** Normally the administration of all affairs pertaining to Greenland is centralized in the Greenland Administration section of the Ministry of State in Copenhagen. A Greenland Committee made up of 8 members of the Danish Rigsdag has charge of all questions pertaining to Greenland that are brought before that body. During the period of World War II, the administration of Greenland was subject to the agreement of Apr. 9, 1941, which was signed by the Danish Minister in Washington, D.C., and the U.S. Secretary of State. This agreement recognized the continuance of the sovereign rights of Denmark, and in order to maintain the status quo in the western hemisphere, allowed the United States the right "to construct, maintain, and operate such landing fields, seaplane facilities, and radio and meteorological installations as may be necessary." The agreement was to remain in force "until the present dangers to the American continent have passed."

**GUADELOUPE.** A West Indian Department of France consisting of two main islands—Guadeloupe proper (Basse-Terre) and Grande-Terre—and the dependent islands of Désirade, Les Saintes, Marie Galante, St. Barthélemy, and St. Martin (northern part only). On March 14, 1946, the status of Guadeloupe changed from a colony to a department, effective January 1, 1947. Total area, 688 square miles. Population (1939 estimate), 310,000. Chief towns: Basse-Terre, capital (13,638 inhabitants), Pointe-à-Pitre (43,551). Education (1943-44): 131 schools and 25,630 pupils. Chief products: sugar, coffee, rum, cacao, logwood, bananas, manioc. Trade (1944): imports 375,000,000 francs; exports 286,000,000 francs. Budget (1939): 83,608,979 francs (revenue and expenditure balanced). Public debt (December 31, 1938), 12,110,210 francs (franc averaged \$0.0288 for 1938; \$0.0251, 1939). Roads (1940): 754 miles. Governor, M. Bertaut.

**GUAM.** The largest island of the Marianas group was ceded to the United States by Spain at the close of the Spanish-American War in 1898. It is situated in the mid-Pacific, 1,500 miles east of Manila, 1,300 miles south of Japan, 3,337 miles from Honolulu, and 5,053 miles from San Francisco. The island has a land area of 225 square miles, extending 30 miles north and south, and 4 to 8½ miles wide.

**Population.** The population, as of August 1, 1946, totaled 23,486 persons of whom 11,556 were males and 11,858 females. Of these 22,695 were native-born and 791 foreign-born. The native population is mainly of Chamorro stock, a mixture of the ancient Chamorro people with Spanish, Mexican, Filipino, Anglo-Saxon, Japanese, and Chinese strains.

While English is the official language of the government and of the schools, the native Chamorro language is widely spoken in the daily life of the people. The predominant religion is Roman Catholicism. Education is offered in the elementary and high school levels. The enrollment for the school year ending April 1, 1946 was 7,150. During the 1945-46 school year 21 schools were rebuilt and opened and 165 Guamanian teachers employed. Provision has been made for the employment of 25 university trained teachers and supervisory personnel from the United States for service in the Guam educational program. An Adult and Vocational Training program has been instituted for the development of skilled and semi-skilled Guamanian workers. As of April 1, 1946, 280 were receiving vocational training.

Throughout the Japanese occupation the people of Guam remained completely loyal to the United States and cooperated with U.S. Military personnel in harassing the Japanese at the risk of death.

**Government.** Guam is classified as a United States possession. The inhabitants of Guam are nationals but not citizens of the United States. A senior Naval officer is commissioned by the President as Governor of Guam, and the same officer is designated by the Secretary of the Navy as Commander, Marianas Area and Island Commander, Guam. The government is administered by departments, at the head of each of which is a Naval officer responsible to the Governor and assisted by Guamanian civilians. In each municipality of Guam a Commissioner is appointed as a district representative of the Governor in an advisory and informative capacity. The legislative body is the Guam Congress composed of a House of Council and a House of Assembly elected by popular vote; Councilmen for four years and Assemblymen for two years. The Guam Congress sits in an advisory capacity to the Governor on matters relating to the welfare and development of Guam. The Judiciary consists of the Court of Appeals, composed of a Presiding Justice and four Associate Justices, two of whom are military officers with legal training and background and two are Guamanian citizens; of the Island Court composed of one Guamanian citizen; and of the Justice and Police Courts, both of which are presided over by the same judge, a Guamanian citizen.

**Events, 1946.** American military forces re-landed on Guam in July 1944 and the island was declared secured from the Japanese August 10, at the cost of 1,352 marines killed and many thousands wounded. Ten months after its recapture it was turned into a fortress and a staging area for the final assault against Japan. Thousands of marines, navy "sea-bees," army engineers, and natives were employed on a 24-hour basis toward the building

of harbor installations and airfields to enable B-29 bombers to take off and land after bombing the industrial centers and military installations of Japan, Iwo Jima, Okinawa, etc.

The extent of the damage suffered by the leading cities of Guam during the bombardment by United States warships between June 19 and July 7, 1944, can readily be seen in the fact that all of the 1,750 homes in the capital city of Agana, population 12,000, were destroyed and the towns of Sumay, Agat, Piti, and Asan were completely levelled. Within one year after its recapture by the Third Amphibious Corps, Guam became one of the most powerful United States advanced base in the Pacific. The largest communications system in the world was established in addition to harbor facilities for the largest battleships. Apra harbor handled more cargo than any other forward area port. Fleet Admiral Chester W. Nimitz, and Lt. Gen. Barney Giles, Deputy Commander 20th Air Force, directed the ever-growing air and naval assault on Japan from Guam.

While these military preparations were going on natives were encouraged to work their farms, and during one month the produce totaled 1,250,000 pounds. Two Victory ships, fully loaded with livestock, i.e. bulls, heifers, hogs, chickens, ducks, and turkeys, were dispatched to Guam to replenish depleted stocks. Eight hospitals were built in Guam to care for the casualties on Okinawa and Iwo Jima; 18 planes a day made 16-hour round-trip flights to evacuate the wounded.

During 1946 the cities of Agana, Agat, and other communities were in the slow process of reconstruction. The Guam Land and Claims Commission had been appointed to receive and adjudicate meritorious claims of Guamanians for damage to real or personal property or for personal injury or death resulting from the war. As of July 1, 1946, 2,841 claims for damage to property, in the total amount of \$7,859,770.55 and 310 injury and death claims had been filed.

On February 20 President Truman signed an expropriations bill making available \$6,000,000 for the rebuilding of Agana and other towns razed by United States armed forces in recapturing the island from the Japanese in July, 1944. After long delay the House of Representatives approved the bill late in July.

The Guam Congress, composed of members holding office before the war, met on May 1 for the first time since the Japanese occupation. An election of a new Guam Congress was held July 13, and the members of both houses were selected on the basis of a reapportionment agreeable with existing population distribution.

On May 30, 1946 the war-born Military Government came to an end on Guam and Naval civil government was reestablished. On that date Rear Admiral Charles A. Pownall, USN, was inaugurated Governor of Guam.

A 100-mile-an-hour typhoon swept over Guam on September 21, causing \$1,500,000 damages to naval installations and disrupting communications. Few injuries and no loss of life resulted.
